

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, MARCH 7, 1903.

[No. 209.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

AT the Annual General Meeting of members of the Automobile Club, on Friday, the 27th ult., Mr. R. W. Wallace, K.C., the chairman, announced that His Majesty the King had consented to become the patron of the A.C.G.B.I. At the same meeting it was announced that a great many ladies having expressed a wish to join the Automobile Club, and the accommodation being insufficient, it had been decided that a Ladies' Automobile Club should be formed to work in harmony with the Automobile Club. We learn that a great many ladies have promised to join, and preliminary arrangements have been left in the hands of Lady Cecil Montagu.

The Club Committee.

A LONG discussion took place with regard to the election of the Committee, and Earl Russell is to be congratulated on the tact with which he piloted a change so that a ballot, in which all members can participate, will have to be carried out. In future only one half of the Committee will retire at each annual general meeting. Meanwhile, several new members have been elected to the Club Committee for the current year, including Captain K. R. Campbell, the Hon. Arthur Stanley, M.P., Messrs. E. H. Cozens-Hardy, S. F. Edge, W. G. D. Goff (Chairman of the Irish Club), C. Jarrott, G. Montagu, M.P., H. Norman, M.P., L. de Rothschild, A. F. Yarrow, and the Master of Ruthven, D.S.O. Among those who did not gain election were Messrs. W. H. Astell, C. Cordingley, Hon. Evelyn Fitzgerald, W. Hancock, Ballin Hinde, F. J. Horsey, J. H. Knight, A. Ledger, W. E. Moss, C. Harrington Moore, F. R. Simms, C. E. Shaw, M.P., and W. Younger, M.P.

Motoring in the Gale.

SUNDAY was scarcely an ideal day for motoring—the weather being cloudy, the roads greasy, and the wind blowing almost a hurricane. Having, however, made arrangements to visit Brighton, we donned our *parapluies*—most indispensable of garments in such weather—and duly set out, journeying, to avoid all tram lines, by our usual route from Bloomsbury via Putney Bridge, Wimbledon, Sutton, and Reigate. Except on Putney Bridge—where a big car with a honeycomb radiator passed us—only one automobile was seen, and that on a cross-road near Crawley. At this place a short halt was made, and thereafter progress was with “deeficulty” over the greasy chalk, Brighton being reached at one o'clock. The sea was in angry mood, the billows white crested, and the huge “rollers” dashed thin spray all over the front, bombarding us with pebbles. The wind all the way down had been dead in our faces, and though it had little or no effect on our “forty,” yet at times we had to slow down to recover our breath. Our party numbered four, including two ladies, and the wind and the mud had left a good “impression” on us.

Brighton to London.

As usual, we found the “Ship” garage full, but not too full to find accommodation for our car, and it will be good news to motorists to know that extensive alterations and enlargements will shortly be made in this most convenient and popular of garages. Shortly after our arrival Mr. Midgley and party arrived on a 16 h.p. Napier, having suffered from the wind and rain like others. And it did rain as we started for home, a short drive along the front having to be abandoned, although not till we had passed by the “Metropole,” where an olive-coloured 40-h.p. Mercedes was seen. The passengers, on our return, were getting into their seats, and shortly dashed by, but fortunately they took the Lewes, and we the London road, otherwise our car might not have liked to have ridden behind in their mud. The rain drove pitilessly, forcing up the sand and mud into our faces and on to our garments until we were covered with a thick plaster. At Reigate the rain ceased, and at the “White Hart” we drew up for a cup of tea, and, removing our “umbrellas,” once again presented a cleanly appearance. The rest of the journey up Reigate Hill was performed quietly, and so we reached town, having, notwithstanding the inclemency of the weather, thoroughly enjoyed our ride of one hundred and ten miles. We might mention that at Reigate we met Mr. W. Ducros on a Panhard and Mr. Sangster on an Ariel.

Conflicting Evidence Results in Conviction.

MOTORISTS travelling in the Dorchester and Weymouth district should be careful, for the way in which the new guessing competition is practised by the police is positively alarming to self-respecting travellers by automobile. At Dorchester on one day last week a motor-car driver was fined for driving too fast, and the superintendent of police said he shouted to the motorist, but “he did not, however, think that defendant heard him,” and the Bench fined him half-a-crown. On the following day the same driver was summoned for a similar offence along the front at Weymouth. A cab proprietor described the pace as being forty miles an hour, a wheel chair man as twenty-five miles per hour, and the police evidence was in favour of eighteen or twenty miles per hour. With such a conflict of evidence, acquittal seemed in sight, and many in court were surprised when a fine of forty shillings and costs was imposed. Moral—avoid Dorchester and Weymouth as well as the pleasant lanes of Surrey.

A Yorkshire Discussion.

THE paper read before the Yorkshire Automobile Club by Mr. Herbert A. Jones, referred to in last week's *Journal*, was well illustrated with diagrams showing the De Dion and other types of contact in their correct and incorrect adjustments. Mr. Jones also showed a large number of De Dion, Basse and Michel, and Charpentier high-speed coils and electric accumulators. Mr. Jones first described the various systems of ignition—magneto-electric, De Dion type, trembling coil and wipe spark. After fully explaining the need of quick breaking in the contacts, this was practically demonstrated.

Then came the description and theories of the cause of the improvement in sparking when using the gap spark. Mr. Hepper and Mr. Winn took part in the discussion. Subsequently Mr. Alf. W. Dougill described the magneto system of ignition, drawing attention to its simplicity. In the discussion on this subject Messrs. Jones, Winn and Read gave their views. Towards the close of the evening Mr. Herbert Broadbent gave a description of the low-tension system of sparking as originally used on the Mors cars and the new system four-cylinder Clements. In the discussion on this and the magneto system there seemed many dissentients to the use of the mechanically operated sparking plugs, it being the impression amongst those in favour of the coil and battery ignition that this complicated matters, but the upholders of these systems maintained that the increase in mechanical parts was outbalanced by the doing away of the coil, accumulator or battery, contact breaker and most of the wires, also the non-liability of short circuiting.

The South African Club.

ELSEWHERE we give a full account of the first meet of the South African Automobile Club, of which the Governor of Cape Colony, Sir Walter Hely-Hutchinson, G.C.M.G., is the president. The proceedings appear to have been thoroughly successful, while the presence of Mr. Rudyard Kipling at the dinner gave added interest to the affair. He dwelt upon the dust-proof car required in South Africa, and advised his fellow-motorists never to pay more than £1 for a dog. Any amount paid beyond that was blackmail, and meant ruin.

Three Horseless Vehicles.

The Business Show.

IN three weeks' time the great Automobile Exhibition at the Agricultural Hall will be opened to the public, and already exhibitors are approving designs for the decoration of stands and generally attending to the picturesque character of their displays. From the schemes for stands that we have seen it is evident that the forthcoming display will vie in attractiveness with the Paris Salon. Last year everyone remarked upon the preparedness with which exhibitors awaited the public, and all who have been allotted space should use every endeavour to maintain the record of the past in this respect. Just now there seems a general holding back on the part of the public in giving orders; and it is confidently anticipated by the trade that the March Show will be the business exhibition of 1903.

The Motor Volunteer Corps.

TUESDAY'S "Gazette" contained the interesting announcement that the King had been graciously pleased to approve of the formation of a corps to be designated the "Motor Volunteer Corps." This new branch of the service has been inaugurated by the efforts of Mr. Mark Mayhew, L.C.C., who

has given reality to the idea of forming a corps consisting of owners of motor-cars who should be willing to keep in readiness for use in manoeuvres and, if necessary, in more serious operations, automobiles of all types, and to drive them or provide drivers when required. It was originally suggested to name the corps the "Automobile Volunteer Corps," but the King is said to prefer the title under which its official formation is announced in the "Gazette." A special uniform has been designed, officers have been appointed, and terms have been arranged with the War Office upon which members of the corps will be remunerated for their services.

The A.C. Discussion.

FRIDAY'S discussion at the Automobile Club showed a considerable falling off in attendance, although the title of the paper read—an abstract of which appears on another page—was attractive enough. Sir David Salomons presided in the early part of the evening, Mr. F. H. Butler subsequently taking the chair, the speakers including Messrs. H. Austin, W. Hancock, J. L. Sampson, Martin Duncan, and H. J. Swindley. Sir David said the main idea of inventors in automobile work should be not to seek for what they knew nothing about, but to improve upon what was already before them. Mr. Austin agreed that it was better to use a principle fairly well known and eliminate its faults than to attempt an entire revolution. Although many engineers looked askance on the change-speed gear, he thought it had served a very good purpose, and had brought about a result which everybody wanted, viz., a flexible engine. They wanted an internal combustion engine with the same flexibility and same advantages as a steam engine. If chains were treated properly, and were properly made, he believed better results could be obtained than by the use of the live axle. It was a bad plan to make the dead-weight on the axle and on the tyres greater than was absolutely necessary. On the subject of horizontal and vertical motors he preferred to say nothing, having rooted ideas on the subject; but he was prepared to admit that it was possible to have a good car with a vertical motor, although he believed the horizontal position was the better of the two.

Automobile Fire Engines.

FROM several leading towns comes news of trials with automobile fire engines. Liverpool, Portsmouth, and Leyland have already these modern appliances, and even in some of our distant colonies the authorities are moving faster in the matter than are those at home. New Zealand and South Africa have their automobile fire engines. Last week the motor fire engine of Messrs. Merryweather was exhibited before the Watch Committee, and the chief officers of the City Fire Brigade at Birmingham, whilst the mayors of some of the neighbouring towns, including West Bromwich, were also present. At Tottenham a 300-gallon automobile steam fire engine, and also an automobile chemical engine, fire escape, and hose tender, are being provided. The other day at Penge an interesting contest took place under the auspices of the Penge Urban District Council, to determine the relative merits of the motor steam fire engine and the horse vehicle of the usual type. In the end the automobile engine triumphed over its old-fashioned rival, so that the movement is now on a fair way to become practical.

Views in 1900.

ON Friday, the 6th inst., an important meeting is being held at the Automobile Club to consider legislative proposals which have recently been placed before the country by that organisation. Much has been said by the leaders of the agitation in favour of the identification of automobiles by numbering or otherwise, and we are afraid that the accommodation provided for the meeting is not sufficient to house the opposition that would like to make itself heard in the matter. It may be

well at this juncture to remind motorists that in December, 1900, the Committee of the Automobile Club sent a circular letter to County Councillors throughout the country objecting to the numbering of motor-vehicles, and it was pointed out that "by voting for the compulsory numbering of motor-vehicles under existing or suggested conditions you will be imposing a restriction which will cripple an important industry." That statement was widely circulated and generally quoted throughout the country. It was also pointed out in the Blue Book issued by the Club in the same year "that the numbering of a gentleman's private carriage was such a departure from the accepted conditions of life in this country that it would lead the public to believe that the man who prefers to use a vehicle propelled by an engine to one drawn by a horse is in the eyes of the authorities a person who is likely to misconduct himself." It was clearly shown that the driver of a numbered motor-vehicle would be subject to continual and rigid persecution, whilst there was no just reason why the proposed numbering should apply to motor-vehicles any more than to dogcarts and other light vehicles drawn by horses.

Why Change in 1903?

THE Club also pointed out that many gentlemen were hesitating in their purchases of motor-vehicles in consequence of the proposed restrictive measures of County Councils, and the facts thus produced undoubtedly contributed to dispel the agitation that was then being aroused against automobilists. We are reminded of the interesting events of the latter part of 1900 by the fact that a meeting of the Executive Committee of the County Council Association has just been held at which the resolutions lately passed by Councils on the subject of motor-cars were considered. These resolutions embodied provisions for the identification of cars, examination of drivers, and other regulations, but after discussion it was agreed that while sympathising in the main with the suggestions of the various bodies interested, the Executive thought the matter had better be left in the hands of the Local Government Board, who would again be asked to press forward alterations of the existing law. It will appear, therefore, from this that the Councils Association, in a measure, are weakening in their advocacy of the numbering proposal, and if such is the case it seems to us that motorists will be wrongly advised if they advocate the proposal, whose only friends outside official automobile circles are the prejudiced persons who sit on magisterial benches and fine motorists on the contradictory evidence of policemen, cab-drivers, and others who have not yet become accustomed to rapid means of locomotion.

Another Record.

MR. ROLLS has been record-making on the Welbeck Estate, and managed to attain a speed of 82.8 miles per hour. Over the kilometre course at Clipstone he had four runs, the best of which gave a time of 27 secs. Those who went to Welbeck last year will remember that the course has a slightly favouring gradient. The French official record on the Dourdan road is 29 secs., a speed of 77 miles per hour. Last year Mr. Jarrott went over the kilometre at Clipstone in 28½ secs., but that was not officially recognised. It is interesting to note that Mr. Rolls drove a 70-h.p. Mors, which he has entered for the Paris-Madrid race, and it was on a Mors car of similar make that Fournier made the best record at Dourdan. The car owned by Mr. Rolls, and illustrated on page 11, has been much modified by him in order to increase its speed and efficiency.

Motor Buses and Traffic.

ON Monday Mr. Worby Beaumont opened a discussion on London traffic at the meeting of the Society of Engineers, and pointed out that a well-worked motor-omnibus service would save much space and time, but this would not be "until omnibus companies use motor-vehicles on a large

scale, so that no vehicle shall run more than a certain maximum speed; and see after the mechanical requirements by a thorough system of daily examination, adjustment, repair, and making right being carried on under a properly-organised staff." Unfortunately, London bus companies seem to be playing a waiting game, and horse-drawn vehicles are as numerous and cumbersome as ever. In the provinces, however, greater activity is being shown, and a motor-omnibus service is about to be established at Hastings. Eastbourne, as already recorded, is shortly to make an effort in the same direction, and at Bournemouth, and along the coast, public motor services will be features of the coming season. The advantage in reducing the volume of traffic on the roadways will be considerable in all these large places.

Stuck in the Snow in the Highlands.

"The Motor Bar."

MR. HENRY NORMAN'S sumptuous magazine, *The World's Work*, is keeping a watchful eye on automobile developments, and in the current number the editor has a comprehensive article on the social and industrial changes likely to be associated with "the coming of the motor." Quoting figures from this *Journal* and other sources, Mr. Norman—who, by the way, is one of the M.P.'s just elected to the Automobile Club Committee—says "that everybody who keeps a horse may keep a car for less money, and that thousands of people who have never felt that they could afford a horse will certainly keep a small car, as soon as they learn the cheapness and reliability of it." Altogether, it is a very roseate picture coloured by this new convert, and so far as the prospect of a change in the old coaching inns is concerned, confirmation comes in the name of a public-house just licensed in Dublin. This is called "The Motor Bar," and only requires a licence to store petrol to make it absolutely indispensable to the motorist.

New York London Traffic.

CAPTAIN PIPER, a leading official of the New York Police, is now in London making inquiries into the management of street crowds by the Metropolitan Police. One thing seems to have struck this American official, and that is the comparative absence of motor-vehicles, compared with what is the case in New York. In the American city, all the chief retail houses have motor-vehicles, and they are very glad to get rid of the horse in the streets. Whilst Captain Piper regards the ordinary omnibus as the best means of seeing London, he believes that the ultimate development in this direction will be the use of motor-vehicles such as are slowly finding their way along the main thoroughfares of the capital. He points out that the adop-

tion of motor-buses would considerably decrease the apparent traffic in the streets, and by doing away with the horse a quicker pace would probably be maintained by the traffic. On this point it is interesting to note his acknowledgment of the fact that our London traffic keeps on the move better and quicker than does the traffic of New York. One statement he made to an interviewer is rather amusing, viz., that our cabs are faster than those of New York. The motorist who has attempted to extricate himself from two or three creeping, crawling cabs which persist in maintaining as slow a pace as is possible, will appreciate the gentle satire of this remark.

Fourteen Miles an Hour.

ON the 31st inst. the new regulations issued by the Local Government Board of Ireland, under the Locomotive and Highways Act, 1896, will come into operation in the Emerald Isle, and it would appear that the authorities across the Irish Channel have more recognition of what is wanted by the public than those on this side. The new regulation fixes the maximum speed limit at fourteen miles an hour, with the provision that the light locomotive must not be driven with any greater speed than is reasonable and proper, having due regard to the traffic of the highway. In England and Scotland the maximum speed is twelve miles an hour, so that it will be seen that the Irish authorities have taken advantage of the little further privilege allowed by law. It is also provided that the driver of a motor-car or motor-bicycle must not leave his machine without having previously taken full precaution against it being started in his absence. Owners of trailers drawn by motor-bicycles will be interested in the exclusion of the motor-bicycle from the old regulation restricting the speed of the light locomotive drawing a vehicle to under six miles an hour. Provided the trailer has a brake, the bicycle can travel at fourteen miles an hour—a concession that will be appreciated by the growing number of people using this form of carriage.

The Gordon Bennett Race.

HAVING got over its preliminary trouble, the Light Locomotives (Ireland) Bill has passed the second and third reading in the House of Commons without interruption and without discussion. It now only remains for Mr. Montagu's measure to be adopted by the House of Lords for a clear ground to be obtained for the holding of the Gordon Bennett Race in Ireland. The Curragh Camp is located in the centre of the circular route over which the race will be run, and we do not see why the officers and men in the great military centre should not be utilised in lining the road and generally proving helpful to the organisers of the contest. On the Continent the military authorities are always much *en evidence* on occasions of these great international motor-car races, and now that legal difficulties have been got over, the soldiers in Ireland might be as reasonably helpful as have our legislators at Westminster.

Manchester Automobilists and Mr. W. J. Galloway, M.P.

UNFORTUNATELY for Mr. Galloway, the annual meeting of the Manchester Automobile Club has immediately followed his action in delaying the passage of the Bill legalising the Gordon Bennett race in Ireland. Naturally he provided the speakers with much opportunity for criticism, which eventually centred in the unanimous adoption of a resolution worded as follows:—"This meeting deprecates the conduct of Mr. W. J. Galloway, M.P., on the second reading of the Light Locomotives (Ireland) Bill, and feels that his conduct is worthy of condemnation in attempting to retard the passing of a measure which must tend to foster the motor industry, and from which immense benefit must accrue to the people of Ireland, especially seeing that in Ireland the measure has received on all hands unanimous support and approval. This meeting is further of opinion that

the proposed race will tend to increase the friendship between the English and Irish peoples."

Careless Motorists.

THE other night as Mr. H. W. Sadd, of Maldon, was returning home, his horse was frightened by a motor-car bound for Colchester and shot the trap and its occupants into a hedge. The riders on the car proceeded on their journey without pulling up. We would suggest that people who have so little regard to the comfort and convenience of others, and who lack the common courtesy of the road, are doing more to further the movement for the numbering of vehicles than anything that could be suggested by the prejudice of opponents. It is a pity that the whole army of motorists should be condemned for the sake of the few who seem to go careering about the country utterly disregarding the consequences.

Our Fifth Year.

WITH this issue the *Motor-Car Journal* enters on its fifth year. The four volumes that have now been closed present a record of activity in the automobile movement that must have surprised even its most ardent pioneers. As a promoter of social intercourse, a reviver of the prosperity of the highways, and an industry that will bring wealth to many and comfort to thousands, the motor-car and motor-cycle are making their influence felt. The *Journal* has marched side by side with the progress of the movement, and has so consolidated its position, that at the present time its importance and influence are second to that of no other similar journal in the world. The index to the volume just completed, which will be issued next week, will indicate how completely the progress of automobilism is recorded in our pages from week to week.

A GLASGOW to London non-stop trial will be held on May 13th and 14th.

THE Automobile Club has decided to promote motor-cycling contests for amateurs.

TO-DAY (Saturday) the Nottingham Club will have the opening run of the season to Nanpanton.

ON Saturday last about twenty members of the Sheffield Club participated in a run to Dunford Bridge, a wild spot on the moors between Penistone and Manchester.

AN agreement has been made between the Motor Traction Company, Limited, and the Fischer Motor-Vehicle Promotion Syndicate, by which the latter concern acquires the undertaking and property of the former.

IT is claimed that Detroit, Mich., will produce more automobiles this year than any other city in the world. The combined output of the Olds, Cadillac, Northern, Ford and other factories is estimated at over 10,000 vehicles annually.

IN "Home Words" for March, we notice an interview with Miss N. G. Bacon, the intrepid lady journalist whose adventures in the early stages of the 1,000 miles Trial brought her into considerable prominence in automobile circles.

STIRLINGS MOTOR CARRIAGES, LIMITED, who are now devoting considerable attention to the construction of motor-boats, are opening new riverside works on the Thames at Strawberry Vale, Twickenham; they are furnished with large dock and slipways, and all appliances necessary for the fitting out and repair of motor-boats.

THE A.B.P. Accumulator Company, Limited, has been registered with a capital of £20,000 to acquire the accumulator department of the business of Ashmore, Benson, Pease and Company, Limited, including Patent No. 22,143, dated October 6th, 1900, granted to Mr. H. T. Lugard in respect of an invention for improvements in electrical accumulators, and to carry on the business of accumulator manufacturers. The registered office is at Parkfield Works, Stockton-on-Tees.

THE "SAVAGE" STEAM-WAGON.

THE latest English firm to take up the construction of heavy steam-wagons is Messrs. Savage Bros., Limited, of King's Lynn, one of whose vehicles is illustrated herewith. The main frame is built of channel steel, stiffened by gusset stays. The axles are of steel, and carry the body of the wagon through heavy plate springs. The wheels are of wood, with steel hubs of the artillery type, the latter being provided with brass brushes. The outside tyres are of steel, with smooth faces, and of good width for road work. A patent "roughing" arrangement can be attached to the hind or driving wheels when necessary in frosty or greasy weather. The boiler is of the water-tube type, designed for a constant working pressure of 200 lbs. per square inch. The steam chamber consists of a solid-drawn mild steam tube, while the circulating tubes are of Mannesmann solid-drawn manufacture. The inlet feed valves are

from the crank shaft. A feed-water heater is provided in connection with the exhaust steam-pipe, and raises the feed water to a high temperature before it enters the boiler. An auxiliary feed pump is also provided. Two speeds, giving three and six miles per hour, are provided, the power of the engine being conveyed through spur wheels to the differential countershaft, and from the latter to the rear road wheels by side chains. The sprockets are attached to the hind or driving wheels by means of steel brackets containing spiral springs; these springs come into compression when starting the load, thereby relieving any sudden jar on the motor and gearing. All the steel driving shafts are carried in malleable steel brackets having compensating gun-metal bearings, which allow for any unevenness of the roads and prevent cross binding. The platform area is of ample size for bulky goods up to four tons, and can be used with or without moveable sides. The designs of these vehicles have been made to meet the requirements of the Act as to the tare weight of heavy

The "Universal Carrier," built by Messrs. Savage Bros., Limited.

of Strear's patent accessible pattern, which allows of the examination of the valve and seating whilst under steam. Klinger water gauges are used, as also a Bourdon patent steam gauge. All steam exhaust and other pipes are of solid-drawn copper. Coal or coke can be used as fuel, this being carried in a large bunker at the side of the boiler. The latter is, however, so arranged that liquid fuel can be used for steam-generating purposes instead of coal or coke. A steam-operated water lifter and suction hose are provided for taking water from a river or other source by the roadside. The engine is of the double-cylinder compound type, running at a speed of 450 revolutions per minute. The high-pressure cylinder is 4 in. in diameter, the low-pressure cylinder 7 in. diameter, the stroke being 5 in. The valves for supplying the cylinders are of the piston type and work in valve liners, which can easily be replaced when worn. The valve and reversing motion is of a specially designed single-eccentric type, and has a large wearing surface. All the necessary stop valves and reversing gear are placed within convenient reach of the driver. The feed pump is worked by reducing gear

motor-vehicles. One of these wagons was recently submitted to a trial, being loaded with 3 tons 12 cwt. of barley in sacks from a steamer lying in Lynn Docks. This was successfully conveyed to the mills of Mr. F. Heading, at Watlington, a distance of seven miles, over roads in bad condition after the heavy rains and frosts, the only mishap being a burst steam pipe at the journey's end. In view of the fact that the trial took place shortly after the vehicle left the erecting shop, without previous test, the result was considered most satisfactory, and we learn that Messrs. Savage have already received a number of inquiries for their "Universal Carriers"—the name they have given to their new steam wagons.

THE Mersey Docks and Harbour Board have adopted the recommendation of their Works Committee to purchase three steam motor wagons. Previous experience of the Board with motor wagons has been that they have conduced to economy, as well as proving a great convenience, in comparison with the use of the horse.

THE FIRST SOUTH AFRICAN MOTOR-CAR MEET.

FROM OUR OWN CORRESPONDENT.

CAPETOWN, FEBRUARY 9TH.

GLORIOUS weather prevailed on Saturday, for the inaugural meet of the Automobile Club of South Africa. There was not a very large attendance, but the frequent applause showed that the spectators appreciated the exhibition given. The meet was not quite what one would term a race meeting in the sense of high speeds, as on the Green Point track as constructed, it would be impossible to attain a speed of more than 36 miles per hour with safety. Besides, none of the cars were designed for racing except one, and that was withdrawn from the event. Without counting quads and motor-cycles, there were twenty-one cars on the ground, including the Wolseley owned by the late Mr. Cecil Rhodes. The result of the various events was as follows:—

FIVE MILES MOTOR-CYCLE HANDICAP.—Mr. J. Thornton, 1½-h.p. Minerva, scratch, 1; Mr. W. M. Jenkins, 1½-h.p. Thomas, 160 yards, 0; Mr. J. Whitehead, 1½-h.p. Werner, 400 yards, 0; Mr. W. C. Fenton, 1½-h.p. Werner, 400 yards, 0.

14-h.p. New Orleans, R. Arderne-Wilson, 4½-h.p. Cudell, A. C. Fuller, 6-h.p. De Dion, H. L. Jenkins, 8-h.p. Darracq, W. M. Jenkins, 6-h.p. Toledo steam car, Toll, Conrad steam car, M. Irving, 12-h.p. Gladiator, B. Langley, 10-h.p. Georges Richard, M. Delponte, 4-h.p. Renault, J. W. Courtis, 6-h.p. Baby Peugeot, Donald Menzies, 6-h.p. De Dion, W. Porter, 4½-h.p. De Dion, E. Edwards, 7-h.p. Panhard, S. H. Adams, 10-h.p. Wolseley, J. Klerk, 4-h.p. Buffalo, Loton, 4-h.p. Oldsmobile, G. Edwards, 6-h.p. Gladiator, Rudge-Whitworth Agency, 12-h.p. Lanchester, Mr. Saunders driving, Garlick's Motor Supply, 6-h.p. Waverley electric stanhope.

LARGE CAR PURSUIT RACE, 3 Miles, 1st Heat.—Mr. B. Langley's 10-h.p. Georges Richard, J. Whitehead driving, 1; Mr. S. H. Adams' 10-h.p. Wolseley, Mr. Saunders driving, 2. The latter was the late Mr. Cecil Rhodes' car, and was raced with canopy and all on. The Georges Richard gained fast from the start and won by 250 yards. The time was taken approximately, and was about 6m. 20s. I think the Wolseley would have shown up better with her canopy and mudguards off, and pneumatics on her driving wheels. She is known out here as a very fast car on the road, and was used during Mr. Rhodes' illness to run in and out of Cape Town with doctors, etc.

Prof. Dawson Turner, of Edinburgh, at the helm of his 10-h.p. Delahaye Car

SMALL CAR PURSUIT RACE, 3 Miles, 1st Heat.—Mr. J. W. Courtis, 6-h.p. Baby Peugeot, 1; Mr. D. Menzies, 6-h.p. De Dion, 2. Time, 7m. 21s.

2nd Heat.—Mr. H. L. Jenkins, 3½-h.p. Darracq quad., 1; Mr. J. G. Rose, 4½-h.p. De Dion, 2; Mons. M. Delponte, 4-h.p. Renault, 0. Time, 5 min. 55 sec.

Final Heat.—Mr. Jenkins' quad would have won this race, but that gentleman, when he found that his machine was objected to, withdrew the flyer. So the tussle came between Mr. Courtis's Peugeot and Mr. Rose's De Dion voiturette. A splendid race resulted in the Peugeot car winning the race by 400 yards.

PROCESSION AND MANŒUVRING OF CARS.—This was a very interesting spectacle. The cars formed a procession quite 350 yards long, and Mr. Rose led them through a series of evolutions, which, while being attractive and pretty, were highly instructive to the lay mind. The ease with which the cars answered the slightest touch of the wheel much impressed those who had hitherto been accustomed to look askance at modern motor-cars.

The list of cars which took part in the procession is as follows:—Messrs. J. G. Rose, 4½-h.p. De Dion, A. T. Henessy,

Mr. Rhodes willed her to his mechanic, Mr. Young, and it was from him that Mr. Adams bought her.

SECOND HEAT.—Mr. E. Edwards' 7-h.p. Panhard, Mr. Menzies driving, 1; Mr. M. Irving's 12-h.p. Gladiator, 2. Time, 5m. 42.6s. For the first mile the Gladiator gained steadily, then she started missing fire. Mr. Menzies was quick to perceive this and quickly made up his ground, and caught and passed the opposing car at a mile and a half, and won easily.

FINAL HEAT.—Mr. E. Edwards' Panhard, Mr. Menzies up; 1; Mr. Langley's Georges Richard, Whitehead driving, 2. Time 5m. 38.8s. There was nothing in the race for the first two laps, neither car gaining at all, but subsequently Menzies gained quickly and caught and passed the opposing car in the last lap.

CLIMBING EXHIBITION.—A large staging was erected in front of the stand, giving four different grades, viz., 1 in 10, 1 in 8, 1 in 6, and 1 in 3, the latter being equivalent to the highest banking on the track. The cars only had a two yards take-off from the bottom of the incline. The De Dions proved themselves to be wonderful hill-climbers, stopping and starting with the greatest ease on any part of the incline. Mr. Jenkins' Toledo steam car was the only car which went up forwards to the top from a standing start. His car, and those of Messrs.

Mezies, Fuller and Rose gave excellent displays of the hill-climbing possibilities of the cars.

FIVE MILES MOTOR-CYCLE HANDICAP.—Mr. H. L. Jenkins, 3½-h.p. Holley, scratch, 1; Mr. W. C. Fenton, 1½-h.p. Werner, 2 laps, 2; Mr. W. M. Jenkins, 2½-h.p. Holley, 200 yards, 3; time, 9.34 min. 4.5 secs. Fenton's time was as nearly as possible ten minutes for the five miles. The last-named gentleman is Mr. Graaf's (the millionaire butcher), mechanic in, and will soon be the proud driver of the largest and most powerful car in the country. It is a 22-h.p. Daimler, and will arrive, all ready for running, by next mail steamer.

In the steering competition, dummies dressed as ladies, which, by the way, caused much caustic comment from callow youths on the stand, were placed at different spots in a rectangular space, and the cars had to steer through these both backwards and forwards. The first attempt resulted in a tie between Mr. A. C. Fuller and Mr. J. G. Rose, and on being run off was won by Mr. Fuller, Mr. Rose overturning a tub.

The band of the Northumberland Fusiliers discoursed sweet music during the afternoon. The thanks of the Press representatives are due to Mr. H. E. Hennessy, who discharged the onerous duties of Press steward in first rate style.

ANNUAL DINNER.

In the evening the first annual dinner of the Automobile Club of South Africa was held, and after the usual loyal toasts, Sir L. L. Michel proposed the toast of the evening. He said his first motor trip had been with the late Mr. Rhodes. Not long ago he went out from Kimberley to meet Lord Milner, who was coming over from Bloemfontein. He started out on one of these machines of which they had heard so much, but they did not get very far. The man who was driving got down periodically and opened the side of the machine and looked in, and then he shook his head. There was nothing in it. At the last election in Cape Town he was assisted by their Chairman (Mr. Hennessy) who drove him about in a motor-car which did not stop at inconvenient times.

The toast of the A.C.G.B.I. was proposed by the Chairman. Mr. A. T. Hennessy and Mr. Rudyard Kipling responded, recalling the days when motoring was looked upon as a cross between pitch-and-toss and manslaughter. His experiences began early in a hired Daimler. At the beginning they were the sport of justices of the peace, they were the sport of the police, and they were the bane of every carrier's cart. That had been changed, and he thought, to a great extent, through the work of the Automobile Club. He thought the Automobile Club had done its little to try and show that motorists could live at peace with other persons who used the King's highway. Even in this country, where the roads were broad and the people were kind, he did not think it would be a bad thing for them to cling together and help one another. One of the things that South Africa needed would be a special make of car—a car that is absolutely dust proof, and one that a Kaffir can drive with a screw driver. They wanted wheels about five feet high, and the carriage about eight feet in the air to allow for crossing drifts. Frankly, though, from his small experience of the Mulzenberg road, he did not think the last word had been said about the great South African car of the future. He did not think the car would be quick—he did not think it needed to be quick, but it was needed to be sound, dust proof, and capable of wandering through a drift on occasion, even though that drift contained about three feet of water. This problem he submitted to their intelligence. They had the country to experiment upon, they had many and various makes of cars, and he should say that unless they equipped their motor-cars well with springs a good many of their cars would be in the repair shops. That was about all the advice he had to offer them on this momentous question except one thing—and he spoke from his heart—never pay more than £1 for a dog. Anything beyond that was blackmail and ruin, and spelt bankruptcy. In conclusion, Mr. Rudyard Kipling tendered hearty and fraternal greetings from the Automobile Club at home.

THE PICK CAM BRAKE.

THE Pick Motor Company, Limited, have lately introduced a new band brake for motor-cars which merits some attention. Referring to the illustrations, *a* is the moving axle or shaft which is to be braked; *b* is the drum keyed thereto; *c* is the leather-lined brake band; *e* and *f* are the two boxes to which the two ends of the band *c* are secured; these boxes are formed with elongated holes, *e'* *f'* respectively, through which passes the shaft *g* rotatably mounted in the standard or support *h* which is shown carried by a sleeve *i* on the shaft *a*. A cam *j* made in one piece with its shaft *g* is fitted inside the two boxes *e* and *f*. This cam is of an elliptical shape, the ends of the boxes against which the cam bears being of a corresponding form. An enlarged sectional drawing of the cam is given in the central illustration. When the cam is in the normal position, that is to say, in the position shown in the drawing, with its major axis upright, the band is slack upon the drum.

If, however, the shaft *g* be turned in either direction through the medium of the lever *k* keyed upon it, the two boxes are moved by the cam in opposite directions or towards one another, thereby tightening the band upon the drum. Upon releasing the lever the spring or elasticity of the band is sufficient to take it out of frictional contact with the drum. The brake is of the double-acting type and is so arranged that it cannot pull itself on.

As already announced, the opening run of the Motor-Cycling Club for 1903 will take place to-day, the destination being Brighton. The starting point will be Purley Corner at 3.30 p.m.

THE Singer Motor Company, Limited, has been registered with a capital of £1,000 in £1 shares, to carry on the business of motor-car manufacturers. Registered office, Canterbury Street, Coventry.

THE tenders of the Lancashire Steam Motor Company, Limited, for a steam motor-wagon to carry four tons, and of Messrs. T. Coulthard and Company, for two wagons to carry five tons each, have been accepted by the Liverpool Dock Board.

BRANCHES of the Motor-Cycle Union of Ireland have been formed at Cork and Waterford. At the inaugural meeting of the former, Messrs. J. T. O'Callaghan and J. T. Mulligan were elected hon. secretaries. The officers of the Waterford section have been appointed as follows:—President, Alderman W. G. D. Goff, J.P.; vice-president, Captain Langrishe; hon. secretary, Mr. W. F. Peare; hon. treasurer, Mr. W. J. Corder.

THE Yorkshire Automobile Club will hold a short run to-day (Saturday) to Wetherby via Harewood and Collingham. The general meet will be at Harewood at 3.15 p.m. Leeds members will meet at the Chained Bull, Moortown, at 2.45 p.m. the Bradford contingent gathering at Manningham Park at 2.30 p.m. Tea will be arranged for at the Angel Hotel, Wetherby, at 4.30 p.m. A week-end tour will be held at Easter.

CONTINENTAL NOTES.

BY "AUTOMAN."

ON several occasions in 1901, I mentioned the attempt (unsuccessful at the time) of the French Government to obtain a monopoly of the refinement of petroleum. The question has now come up again, and by a majority of 129 votes the Chamber of Deputies has invited the Government to establish as soon as possible a state monopoly over the refinery of petroleum. In addition to this a tax of one franc 25 centimes per 100 kilos (representing about one shilling per cwt.) was adopted on crude petroleum.

THERE is no doubt that the ultimate object of these proceedings is to force automobilists to use alcohol instead of petrol. The petrol used to propel motor-vehicles in France is entirely an imported article, and the French peasant gets nothing out of it. And unless the Government can replace the demand for beet-root to the peasant, it dare not take off the bounty on sugar, for it would then throw thousands of peasants out of work. If,

For acetylene lamps it will be considered whether they can be easily lighted and extinguished, and then relighted after a lapse of time, and whether all kinds of carbide can be employed in them. The lamps will also be tried on the road at night, and judged according to the amount of light, and how it is reflected and distributed along the surface of the roadway. The steadiness of the light and the brilliancy of the reflector when the lamp has been lighted for some time will be noticed.

THE form of car bodies is gradually changing. Covered cars are coming more and more into vogue, and in all the streets of Paris, both in the business quarter and on the Boulevards, and along the avenues where pleasure-seekers are mostly to be seen, there is a constant procession of covered cars. Most of these are driven by servants, or rather *mecaniciens* in livery, and the owners are in the back part, being driven to their business or pleasure, as the case may be. The body known in French as the "cab" seems to be the most fashionable, as I believe it is the most comfortable. It resembles the upper part of a hansom cab minus the driver's seat, and is fitted over the back seat of the motor-car. In this covered body the owner is quite free from

The Consumption Criterium—Examining the Tanks of the Chenard-Walcker Car, the Winner of the 650-1,000 Kiloz. Class.

however, it gets the refinery of petrol into its own hands, it can put up the price of that quality which is used in motor-cars and thus create a demand for alcohol. Then the agriculturist can turn his attention to producing grain or other cereals for the alcohol distilleries, enabling the sugar bounties to be afterwards taken off.

THERE are nowadays so many competitions for automobiles and all that is pertaining to them, that it almost becomes impossible to follow them all. One, however, which is being organised by the A. C. du Rhone, is particularly useful and instructive, viz., the *concours des lanternes*, or the "lamp trial." It is to take place on March 10 and 11 at Lyons, on the premises of the Automobile Club. Lamps of all kinds are to be admitted, paraffin, acetylene, or electric, and there is to be a special prize for gas generators and holders, and for lamp brackets. The photometric strength of the light given is to be taken into consideration; the size and the weight will count, the facility of charging, lighting, and cleaning will be points in their classification; and the price will not be forgotten. No lamp will be eligible for a prize which is not absolutely proof against explosion.

the dust and yet can have the full benefit of the fresh air. He also faces the wind, and has a good view of the scene in front of him. He can easily direct his driver, and should the rain come down he can close himself in.

THE A.G.A. has decided to organise an Easter run which would be particularly interesting to any English tourist who has the time to visit one of the most picturesque parts of France, namely, la Touraine. The country is beautiful, the roads are excellent, and almost every town and hamlet are closely interwoven with French history. The tour will start from Paris on Monday, April 13th, and will end at Paris on April 22nd. The entrance fee is 50 francs (£2), and will be received at the secretary's office of the Association Generale Automobile, 6, Place de la Concorde, Paris, until March 31st. Only members of the A.G.A. or A.C.F. or an affiliated club will be allowed to enter, and the vehicle must be a *bona-fide* touring car.

THE Count of Recope has proposed to the Committee of the A.C.F. a new apparatus for measuring the power developed at the road wheels by a motor-car. The apparatus consists of two

dynamos, to the armatures of which have been attached flexible shafts; the further ends of these flexible shafts would then be fixed to the axle boxes of the back wheels of the car to be tested. The car would be jacked up slightly and started up, the front wheels resting on terra firma and the back wheels, of course, just clear. The current produced by the two dynamos would, added together, give, by means of a simple calculation, the h.p. transmitted to the road wheels. In addition to this, the difference, if any, between the currents produced by the two dynamos would indicate whether or not the differential gear was doing its work properly. This machine would be most useful to the trade, and would settle once and for all the vexed question of the loss in transmission. It would establish a Lloyds for motor-cars which could issue certificates to all applicants, making a small charge to cover the expense.

It has been decided that the start of the Paris-Madrid race will take place at Versailles. The member who represents Versailles in the Chamber of Deputies is none other than the famous Gautier de Clagny, who nearly two years ago interpolated the Chamber on the subject of suppressing automobile road racing, on the occasion of the Paris-Berlin motor-car race. His interpolation raised a storm of motorphobia and resulted in the Government promising to put its veto on all road racing in France. Gautier de Clagny, however, has been so completely converted that he joined the A.C.F. last December, and has now been directly instrumental in having the race pass through his own city of Versailles.

It has, I believe, been decided to reduce the interval to one minute in starting the vehicles in the Paris-Madrid race, and there are several projects for even finding a more speedy way of getting the whole field away in less time. One idea is to send a big car and a small car off together, so as to give the small cars a better chance. Half a minute between each car would probably be quite ample to avoid accidents and confusion.

It has been also decided that a day's halt shall be made in Bordeaux, where the cars will be marked with lead seals for the Spanish Customs formalities. There is no treaty between France and Spain with regard to motor-cars, and the affixing of the lead seals is all that will be required to be done.

THE Automobile Club of Touraine is organising a series of automobile competitions from the 16th to the 19th April next, and is formulating its rules on distinctly novel lines. The principal event will be a Tourist Competition for heavy and light cars, voitures, and motor-cycles, the various items taken into consideration being comfort, elegance of design, ease of working, regularity in running, cost price, the working cost per kilometre of distance covered, the weight as affecting undue wear of the pneumatic tyres, etc. The distance will be 300 kilometres, to be covered on April 17th and 18th, the 19th being devoted to an exhibition of the competing vehicles.

ANOTHER interesting competition in connection with the event is that of automobile lamps. Competitors will have to charge and light their apparatus in the presence of the judges, and the duration of each light without recharging will be timed, the facility of charging and lighting being also noted. Note will be taken of the ease of cleaning the lamp after it has burned itself out. The awards will be based upon the prime cost, the cost per hour of supplying the light, the time of burning without recharging, the intensity of the light, the ease of recharging, lighting, and cleaning, and the size and the weight of the lamp, which must light up the road for at least 60 yards. The tests will be made at night, and gold and silver medals will be given as prizes. The competition is international, and the results will be of very great interest.

CONSIDERABLE excitement prevails in motoring circles in Germany owing to the organisation of a torchlight parade of

automobiles of all kinds at the Kaiser's Palace in Berlin to-night (Saturday). Over 250 motorists from all parts of Germany have announced their intention of participating in the parade. The riders of motor-bicycles will head the procession, followed by motor-tricyclists, representative members of no less than 21 German automobile clubs, and "unattached" motorists. The Kaiser has promised to receive the homage of the motorists from the terrace of the Palace, and arrangements have been made to present to His Majesty an album containing the names of all participants in the "Huldigungsfahrt"—as it is termed.

THE brake trials, which are to be held on the 28th inst. in connection with the Nice week, will be of special interest, for they include a new classification in such tests, namely, of *freins de secours*, or emergency brakes. They will be required to act directly on the rear road wheels, without the intervention of the differential or other gear. A point to be considered in awarding the prizes, besides the power of the brake in forward or backward application, will be its adaptability to all kinds of vehicles. The other brakes will be tried both forwards and backwards, and also in a test of endurance over a descent of about five miles at a minimum speed of nine miles an hour.

THE accompanying illustration shows a novel little vehicle exhibited at the recent Salon by Messrs. Sautel and Sechaud, of Gentilly, near Paris. As will be seen, it is practically a tricycle the driver sitting upon an upholstered seat in front, with an inclined steering wheel in front of him. The vehicle is propelled by a 4-h.p. water-cooled motor, and the power is conveyed direct

to the rear wheel through a revolving shaft, with two small bevel wheels at the end engaging with larger bevel wheels fixed to the rear road wheel. Either one or the other of the small bevel wheels can be locked by a sliding feather to the revolving shaft, and thus either a low or a high gear can be obtained as desired. A feature of the little car is that all the various movements are controlled by the steering column, which, as will be seen, can be placed in different positions in a quadrant.

THE Arenberg Cup, offered to vehicles utilising alcohol as fuel, is to be run on the Paris-Bordeaux section of the Paris-Madrid race. The cup is held by M. Rene de Knyff, and so far only two entries have been received—Gobron-Brillie and Brouhot.

THE Century Engineering and Motor Company, Limited, have made a net profit of 7 per cent.

MR. J. E. HUTTON has sent us a copy of a pamphlet in which a very complete description is given, with drawings, of the Panhard automatic carburettor which attracted so much attention at the recent Paris Salon.

MESSRS. PETO AND RADFORD, LIMITED, have just issued a new price list of accumulators, contact breakers, sparking plugs, etc., for ignition purposes on petrol motor-cars. It includes particulars of an improved low-resistance primary battery for re-charging accumulators.

MOTOR-CYCLING NEWS.

AMONG the new motor-bicycles exhibited at the recent Manchester Show was the "New Bowdon," of which an illustration is given herewith. The machine, which is made by Messrs. Henry Cragg and Sons, of Altrincham, Cheshire, is fitted with a Simms 2-h.p. motor with magneto ignition. As will be seen, the

motor is built low in the frame and rests on two arms on the back fork bridge. The carburettor is of the spray type. The chief feature of the machine is found in the transmission. The motor chain wheel is provided with a clutch which enables the engine to be started before mounting and to be disconnected from the transmission at will when riding through traffic. The drive is on novel lines; on the motor-shaft is mounted a double-sprocket while to the rear wheel is attached an aluminium pulley into the grove of which is shrunk a raw hide belt. The connection between the sprocket and the pulley is by means of a specially designed Renold $\frac{1}{2}$ in. pitch double roller chain, the two rollers being separated by a link plate; this being, as are the outer plates, of the same pattern as used in the Renold silent chain. By this arrangement the teeth of the sprocket wheel mesh between the rollers of the chain, while the bottom of the side and middle plates grip the belt shrunk in the rear pulley. Messrs. Cragg inform us that they have thoroughly tested the drive and are satisfied that it has many advantages over the ordinary chain or belt drive; it is as silent as the belt driven machines, while should there be a back fire the clutch takes it up, reducing the strain on the chain to a minimum. The road wheels are 26 in. in diameter, shod with 2 in. pneumatics; two brakes are fitted to the machine.

HEREWITH we illustrate the somewhat novel motor-bicycle lately built by M. Andre Realier-Dumas, a well-known French

[La France Automobile.

sculptor and painter, for his own use. The frame and front forks of the machine are all of wood, the engine, a 2 $\frac{1}{2}$ -h.p. De Dion, being slung from the frame by stout iron straps.

THE following useful advice to motor-cyclists, is culled from the new catalogue of Osmond motor-bicycles, a copy of which has been sent us. When starting a long journey, do not forget what you may require on the road, namely:—Pump, tyre repair outfit, spanners, oil can, waterproof cape, map, chain bolt and nut, address book of suppliers of petrol, small piece of glass or emery paper, spare sparking plug, some spare belt hooks, small box of powdered resin, adjustable spanner, screw driver, pocket knife, pair of pliers, two tyre repair bands, and a small coil of copper wire; the latter is found to prove most useful in cases of emergency.

THE Liverpool Motor-Cycling Club, which has now forty-seven members, proposes to hold a motor-cycle race meeting at New Brighton during the coming season.

A NEW motor-bicycle stand known as the "Lever" is being put on the market by Mr. Montagu G. Townsend, of Totton, Hants. It is made of wood, the uprights being strengthened by round iron stays. It has a base of 24 inches, and is consequently perfectly rigid. Between the two uprights is a trough which can be raised by a foot-lever. The motor-bicycle is run along the trough until the axle touches the uprights; by pressure of the foot on the lever the trough containing the wheel is raised, and the axle, when the foot is removed from the lever, drops into slots in the uprights, thus obviating the necessity of any lifting.

Mr. Bert Yates on the Humber Chain-driven Motor Bicycle with Trailer.

THE Nottingham Motor-Cycle Club will hold its opening run on Saturday, the 14th inst., the destination being Newark. Members will meet at Trent Bridge at 2.30 p.m.

ON Thursday last week a lecture on "The Development of the Motor-bicycle" was given in Dundee by Mr. T. G. Parsons, of the Rossleigh Cycle and Motor Company, Ltd. From the crude mechanical novelty of 1898 and 1899 the motor-bicycle had, he said, developed into a machine which approached its pedal-driven brother in reliability. In the matter of efficiency advances had certainly been made, and he was of opinion that the time was ripe for the trade to make a closer investigation on a scientific basis with a view to further increasing the efficiency.

So many cyclists in Bath have taken to motor-cycling that a motor-cycle section has just been formed in connection with the Bath Cycling Club.

THE SOURCES OF NOISE IN MOTOR VEHICLES.

ALTHOUGH the complaints of the general public in regard to the noise made by motor-vehicles are rapidly lessening, as it is becoming more generally realised that the sounds made by these conveyances are unusual rather than actually of large volume, it is still of importance that the sound emitted by motor-cars when in operation should be minimised in the interests of a general reduction in the noises of traffic.

It will certainly be a strange case of "turning of the tables," but it is confidently believed that the motor-vehicle will very soon be preferred on account of its noiselessness. The noise of the beat of the iron shod hoofs of horses upon our thoroughfares cannot well be eliminated, and where the road surface is slippery this is a source of a far greater volume of distressing sound vibrations than would arise from the operation of even a greater number of motor-cars. It must be a matter of common experience that the "hoof noise" under these conditions is far greater than the noise arising from the motive power of petrol vehicles fitted with suitable silencers and travelling at an

evidences some looseness or irregularity of operation upon the part of the mechanism, and the latter some fault in lubrication, some misproportion of parts, or some failure to protect the mechanism from disturbing outside conditions.

It is unquestionably true that the high speed motors are the noisy ones, and this is likely to continue to be the fact as long as the reciprocating principle is adhered to. All parts, such as valves, which strike other parts must do so at higher velocities, and such noises as are present are more frequently repeated. What the internal combustion turbine might accomplish, even at high speeds, and what effect it might have upon the noise problem, are merely matters for conjecture.

It is well known that the exhaust sounds of petrol engines can be minimised just as fully as desired. It is merely a question of how large a silencer one cares to adopt, or how much one is willing to sacrifice in power lost through back pressure, or both, and eventually exhaust silencers may be expected to be generally and generously constructed, so as to strike a happy medium between the demands of sound reduction and the evils of exhaust throttling. In the ear of the enthusiastic motorist, exhaust noise, unless too sharp and penetrating, is not noise at all, but more related to a musical sound below the limits of audition.

[Argent Archer.

equal speed. The impossibility of removing the "hoof noise" is the hard fact which must in the end make the motor-vehicle preferred on the ground of noiselessness. Centuries of training have taught mankind to ignore the noise of hoofs which is so large a factor in the "roar" of great cities, but if one consciously wills his ears and brain to take account of it, he realises at once the large part it plays in the nervous strain which is constantly imposed upon dwellers in busy communities. The city of the future will not, remarks Mr. A. L. Clough in the course of an article in the "Horseless Age," possess a "roar," but rather a mild hiss or rustle, and this will be brought about by the construction of better roads, the suppression of hoof noises, and the universal use of the resilient tyre. The tendency (with all it implies) in the direction of a better nervous condition among the people, will have to be attributed to the general advent of the motor car.

The sources of noise in a petrol car may be placed under three heads: (1) Engine noises. (2) Transmission gear noises. (3) Frame noises. It may be said that the noises which are most distressing are of two kinds, viz., sounds which are irregular in their occurrence and sounds which evidence an excessive or unusual wear of a part. This fact must become increasingly true as mechanical intelligence advances, for the former source of disturbance

And in this view he is not without support from the text books, which define noise as sounds of irregular occurrence. A motor missing explosions produces, on the other hand, unqualified noise, abhorrent to our æsthetic as well as to our mechanical senses. When a motor is missing, the effect upon its driver is not far different from an attack of palpitation of the heart. Mankind has an innate love for the regular, and something inside us consciously or unconsciously beats time.

The noises of valves meeting their seats and that of the cams which operate them are of no small consequence. Exhaust valves have, as a rule, very powerful springs and they close in many cases with a noticeable clatter. Inlet valves, although operated with much less powerful springs, produce at high engine speeds a considerable amount of noise. If both these valves could be closed, as well as opened, by "uniform acceleration" cams, so that their velocity upon meeting their seats would be zero, much of this noise would be prevented. The noise of the air entering the carburettor and passing the ports produces in many engines an unpleasant hollow, wheezing noise; and some makers provide an air suction consisting of a multiplicity of small openings in some non-resonant material, such as rubber pipe, which constitutes an intake silencer.

(To be concluded.)

THE SANSON CARBURETTOR.

THE accompanying illustrations show a new spray-type carburettor for petroleum-spirit motors that has lately been put on the market by M. Louis Sanson, of Grande Rue, Dieppe, France. The apparatus is composed of two compartments, the vaporising and the constant level compartments. The vaporising portion consists of a chamber *a* in communication with the motor by the tubing *B* and with the chamber *C* by a series of apertures *d* in the direction of the axis of the chamber. The number of the perforations varies with the size of the apparatus. The petrol enters the chamber *C* through the nozzle *e* and the air through chamber *F* in

Fig. 1.

communication with the atmosphere by openings *g*. Just below the nozzle *e* and in the chamber *C* will be seen a hollow cylinder *h* surmounted by a conical roof, in the cavity of which is placed the "reheater" *J*, into which a part of the exhaust gases is led and from which the gases escape through the openings *K*. The flow of petrol is regulated by the needle valve *L*, operated by the lever arm *m*. The suction is regulated by the valve *P*, operated by the lever *n*.

The constant level compartment contains a float *Q*, through the centre of which passes a rod *S*, serving to guide the float in its up and down motion. The float carries a pointed valve *R*, by which it shuts off the petrol when the level reaches a

Fig. 2.

certain height. The float chamber communicates with the space *o*, surrounding the needle valve in the vaporising chamber by the channel *t*, in which is located the ball *u*.

A partial vacuum being created in the chamber *C* by the suction of the piston, the petrol issues from the nozzle *e*, and spreads over the conical roof *i*, of the heater, where it is immediately vaporised by the heat of this part. The air arriving through the openings *g* and chamber *F* becomes charged with the vapour of the petrol, the mixture becoming more uniform and gaseous as it passes through the vaporising "grate" *d* and through the chamber *a* and the tubing to the motor.

The claims made for this carburettor are that it operates well

and regularly without any valves and wire gauze, and that there is no need for an extra air admission to obtain the required density of the mixture. The suction of the air is distributed in a circle and the petrol arrives at the centre of this circle. The vaporization of the petrol is thus effected in the centre of the "field of carburation." Stress is laid on the automatic feed of the petrol by means of the float and the ball check valve. This ball establishes the equilibrium in the channel *t*, which affects the form of a syphon, and prevents the return of the petrol into the float chamber after each suction stroke. It is also claimed that the apparatus operates as well with alcohol as with petrol.

MOTORS AND THE ROADS.

"FOR half a century or more people have been very patient about the roads," remarks Mr. E. P. Wilberforce in a thoughtful article in the current *Badminton Magazine*, and, in consequence, motorists have become a long-suffering class. Fortunately, the Gordon Bennett race seems destined to cause people to realise the consequences of their neglect in the past, and the haste with which the local authorities in Ireland are condemning the road surveyors and others, who have not kept the highways in a perfect state, is evidence of a movement that will improve the roads of the country—to the material advantage of the nation. The other evening a meeting of the Irish Roads Improvement Association was held in Dublin, when it was stated by Mr. R. J. Meccredy, who presided, that a good surface increased the efficiency of the roads by close on 100 per cent. It cost less to maintain a road in good condition by means of the modern scientific methods than by the old system which was in existence in many parts of Ireland. The object of the association was to excite the interest of the public, and to influence them to contribute to the funds necessary to carry out the campaign. Splendid work had already been accomplished in the North, and a centre had been established in Cork. It was now sought to establish a branch in Dublin. The work of the intelligent Urban and District Councils and of the County Council of Dublin had resulted in an improvement of the Dublin highways. But if the County Dublin roads were open to improvement, how much greater was the necessity for an improvement of the roads in other districts? After the race for the Gordon Bennett Cup tours would be mapped out for the visitors, and it was natural to suppose that those districts in which the roads were fair would be selected. After the race the districts where the roads were best would be overrun with tourists and motor-cars, and thousands of pounds would be spent. This would bring home to the Councils in many places that the roads were not good, and that without good roads they could not expect tourists to spend money amongst them.

We are glad that public opinion is being aroused in Ireland, and while the Automobile Club is forming a fund to improve the route of the race, other organisations are urging the local authorities throughout the country to combine for a general advance. Motor-ing will be a factor in the future prosperity of Ireland; but its full value depends on the work of the Irish people in facilitating travel by the provision of good road surfaces.

Mr. Wilberforce suggests that road surveyors might try their hands at improving the road surface, the goal to be kept in view being "a waterproof road surface that shall wear well, produce neither dust nor mud, be harmless to horses and tyres, and cost not more, and, if possible, less, than the present system." We are told in the "Badminton" article that already some "rich motor-car owners pay a considerable amount to the authorities for extra steam rolling to be done in their neighbourhood, and find the expense warranted by the saving in tyres." But this is a work for which public funds ought to be provided, and provincial automobile clubs might usefully draw attention to the subject in the public discussions they hold from time to time. It is satisfactory to find that sportsmen as well as strict utilitarians are in agreement as to the wisdom of spending money in maintaining the highways of the land.

SOME USEFUL NOTES.

SOME useful hints with regard to the charging of accumulators from primary batteries are given in the new catalogue of Messrs. Peto and Radford, Limited. When accumulators are charged from a primary battery it is important to remember that the pressure in volts from the primary battery must be increased after the voltage of the accumulator has commenced to rise. When charging a discharged 4-volt accumulator, which would have a pressure of about 3.6 volts, a less number of the primary battery cells are sufficient at commencement to provide enough power for the necessary charging current, as the primary will have about 4.8 volts or more. A difference of over 1 volt between the primary and the accumulator is sufficient to charge the accumulator at 2 amperes, but as the charging proceeds the voltage of the accumulator soon rises, and it is necessary to put on more power from the primary cells to keep up the difference of 1 volt between them, or to increase the current to 3 to 4 amperes.

It is impossible to give exact instructions for regulating the current, as it depends entirely on the condition of the accumu-

and the tappet), and if found too long should be filed off. This is a process which is better done at home than at the roadside.

ACCUMULATOR terminals should always be kept scrupulously free from corrosion, otherwise they will gradually become "eaten away" to such an extent that a slight extra jolt on the road will suffice to break them off, and it may then be a matter of great difficulty to effect even a temporary connection. After being thoroughly cleaned and polished, the terminals may be fairly well protected from the action of the acid by a coating of vaseline.

ALWAYS see that your spare parts—especially the valves—are of the proper size for your engine, so that there may be no annoying delay if they are suddenly called into requisition.

WHEN a new car is received from the makers, be sure to ascertain that the petrol, oil, and water tanks are perfectly clean before filling them up. Many makers are careless about the condition in which cars are sent out, and the tanks often contain debris in the shape of dirt, and bits of straw and string, which, when swept into the carburettor or crank-chamber, or accumulated

The Gladiator 16-h.p. Four-cylinder Car. (See issue February 14th, page 935.)

lator on charge, whether it is very low in voltage at the start, the time it takes to recover its voltage, etc. It should be noted that as the charging current is the result of the difference in voltage between the primary battery and the accumulator, and assuming that this difference is 1 volt, a rise of a $\frac{1}{2}$ volt in the accumulator as it gets charged will reduce the charging current by one half, or 50 per cent., or a fall of a $\frac{1}{2}$ volt in the primary battery will have the same result, hence the necessity of a resistance and due care in regulation. Practically, if the primary battery is giving 5 volts, and the accumulator 4 volts, four-fifths of the primary battery voltage is used in overcoming the opposing voltage of the accumulator, leaving 1 volt as the pressure available for the actual current flowing, and therefore making the rise or fall of current proportionate to the increase or decrease of this 1 volt, and not proportionate to the total voltage of the battery.

It occasionally happens that the stem of an exhaust-valve is slightly longer than it should be, so that the valve is prevented from closing properly. The spare exhaust-valve, which ought always to be carried, should be examined for this defect (best done by placing the valve in position and seeing whether, when it is closed, there is the usual clearance between the end of the stem

in the pipes of the radiator or in the pump, do not, needless to say, conduce to the satisfactory running of the engine.

MR. H. C. BABBITT, the chemist of the East Pittsburg Gas Works, Pa., U.S.A., writes:—"A number of automobilists have complained that the use of calcium chloride as an anti-freezing medium in winter time corrodes the tanks, pipes, etc. This differs from the results of my experiments on the action of this salt on the metals commonly used and from the practical results obtained by others, and must be due to the presence of free acid in some of the commercial calcium chloride. To neutralise the free acid, it has been suggested that caustic soda, or other alkali, be added. This is open to two serious objections. If the acid were exactly neutralised, sodium chloride (common salt) would be formed and introduced into the solution in proportion to the amount of free acid present, which would be undesirable. If soda in excess were added, lime would be precipitated and sodium chloride introduced into the solution in proportion to the soda added. The rational neutraliser, to my mind, would be a handful or two of lime, slaked or unslaked. Lime is comparatively insoluble in water, and would combine directly with any free acid present forming calcium chloride, slightly increasing the strength of the solution."

HERE AND THERE.

THE sparking plug "discovery" is still an absorbing topic in motoring circles. M. J. F. Henrique, of 41, Avenue de la Grande Armee, Paris, sends us a sample of the "Disrupteur" he has lately introduced. As will be seen by the illustration, Fig. 1, it closely resembles that which Messrs. C. S. Rolls and Co. have put on the market. The "Disrupteur" was devised by M. R. Le Grand, who has taken out a patent for it, the

Fig. 1.

Fig. 2.

main claim being that the "jump" takes place in the centre of an insulated mass, so that there is no danger of the external spark igniting any petrol vapour that may collect about the motor. The insulating fibre is cut away at the top and a piece of glass inserted, thus enabling the spark to be seen, and consequently obviating the necessity of continually removing the plug from the motor. The wire from the coil is connected to the terminal at the right of the illustration; the gap can be regulated by means of the screw at the left. Fig. 2 illustrates the device, having a similar object, which Messrs. Bransom, Kent and Co., Ltd., have put on the market, and which is self-explanatory.

Punch has been using the Lanchester car to illustrate a joke.

THE King's 20-h.p. Daimler car is to be fitted with Messrs. A. W. Gamage's spark intensifier.

SIR T. G. BIDDULPH, BART., is among the latest accessions to the ranks of the Automobile Club.

THE Wolverhampton Motor-Cycle Club has arranged an excellent programme of runs for the spring.

IT is announced that the great Krupp iron and steel concern, of Essen, Germany, is taking up the construction of steam-cars of the Serpollet type.

THE Lord-Lieutenant of Ireland and the Countess of Dudley are enjoying a brief visit to the North of Ireland, making Portrush their headquarters. His Excellency's motor-cars preceded his arrival at the little town.

THERE is a project among the members of the Automobile Club of America for the establishment of a large and well-appointed country club-house somewhere on the shores of Long Island Sound or the Hudson, within easy touring distance of New York.

THE first motor-car wedding in the Taunton district took place last week at Ruishton, near the town. The wedding party were conducted to the church in motor-cars, supplied by Messrs. J. Beach and Sons, of Taunton, Mr. J. Beach driving one and Mr. Percy Beach the other. Subsequently the guests were delighted with trips on the cars after the breakfast.

ON Saturday, Lord Rosebery visited the works of the Mo-Car Company at Paisley. Mr. Johnston, managing director, and Mr. Napier, manager, showed his lordship through the works. Altogether, about an hour and a half was spent at the place, the party afterwards returning in motor-cars to Ferguslie. Shortly after noon Lord Rosebery left Ferguslie Park in one of the cars, motoring all the way to Glasgow, to catch the one o'clock connection for Edinburgh.

AN Automobile Club has just been formed in Rome.

MR. L. J. O'HIGGINS is establishing a garage in Harry Street, Dublin.

AN American firm of motor-car builders has given the name "Santos Dumont" to its vehicle.

THE County Down surveyor uses a motor-car when inspecting the roads of his county.

THE Stourbridge Urban District Council is petitioning the County Council to deal with the speed of motor-vehicles.

IT is stated that since the Longuemare carburettor for petrol motors was introduced no less than 21,000 have been sold.

THE Municipality of Antwerp is organising a system for doing the whole of the street scavenging, refuse removal, and the general sanitary service, by means of automobiles exclusively.

AN outbreak of fire has occurred on the premises of the Northern Carriage and Motor Car Company, at Aberdeen. Fortunately the vigilance of Mr. Mitchell, joint manager, led to its arrest before serious damage was done.

THE Whitney Manufacturing Company, of Hartford, Conn., U.S.A., have sent us a list of their roller chains for motor-cars; they are made in four pitches— $\frac{3}{4}$ inch, 1 inch, $1\frac{1}{4}$ inch, and $1\frac{1}{2}$ inch—each pitch being made in two widths.

AT a Council meeting of the Associated Chambers of Agriculture in London, Mr. Rider Haggard suggested the collection and delivery of goods and parcels up to 100 lb. weight by means of motor-cars in conjunction with railways.

ACCORDING to M. Henri Fournier it will cost each firm competing in the Gordon Bennett race £12,000 for building cars and maintaining staffs of workmen distributed at different points along the road with all the material for effecting repairs.

A USEFUL little table, showing the approximate horse-power required to move a vehicle of a total weight of 1,000 lbs. up different grades and at various speeds, ranging from six to forty miles per hour, has been issued by Mr. Chas. D. Shain, of 11, Broadway, New York.

THE motor-cycle section of the Austrian Touring Club is organising a consumption trial for the 22nd inst. It will be held on a 100-mile course on the Trieste road, near Vienna, and will be confined to motor-bicycles weighing less than 110 lbs. Speed is not a factor in the result of the trial, but a minimum average of $15\frac{1}{2}$ miles per hour will be required.

MESSRS. RATCLIFFE BROS., of Frinton-on-Sea, have lately introduced a mechanically-operated inlet valve arrangement specially designed for fitting to the engines of existing $3\frac{1}{2}$ -h.p. Benz cars. As a good many of these little vehicles are in use up and down the country, and as the makers claim that the fitting of their

device increases the power of the motor by about 25 per cent., the accompanying illustration will no doubt prove interesting. The set of fittings comprise:—A lever, machined and fitted with studs, pins and axle for wheel, strong spring for inlet valve, cam wheel turned and bored, bracket to be fixed under present nut or girder, with slot hole for adjustment, and a plate, with cam for lift. With the mechanically-operated inlet valve, which allows the piston to suck in a full charge of gas at each stroke, Messrs. Ratcliffe claim that the $3\frac{1}{2}$ -h.p. Benz engine will run at a much slower and more regular speed whilst standing, and that the car will take top speed on heavy roads and on hills, where without it second speed would have to be used. The set of fittings is not very costly, and can be put in position on the motor by any motorist in less than an hour.

THE Italian War Office is considering a scheme of establishing a regular motor corps in connection with the army.

THE sole contractors for floral decorations at the Automobile Exhibition, Agricultural Hall, are Messrs. Stroud Brothers, Green Lanes, Finsbury, N.

THE Mors Company are building a 100-h.p. four-cylinder petrol motor for the Brothers Lebaudy, the designers of the Lebaudy air-ship.

THE A.C.F. silencer competition, which should have been commenced on the 2nd inst., has been postponed until Monday next, the 9th inst. There are twelve entries.

AT the small but interesting Boating Exhibition now in progress at Earls Court, S.W., Stirling's Motor Carriages (Limited) have a very fine show of boats fitted with the Racine motor.

TWENTY entries have so far been received for the "Criterium des Transports Automobiles" which is being organised by *La France Automobile*. The list closes on the 12th inst.

MR. J. BUSH, of Windsor House, Marine Parade, Barmouth, who already has a motor repairing plant, has added a dynamo for recharging batteries, and is also keeping a stock of petrol.

THE 12-h.p. Peugeot lorry which won a gold medal in the recent Consumption Criterium in France, when it carried a load of 2 ton 17 cwt., is now on view at the depot of Messrs. Friswell, Albany Street, N.W.

THE Manchester Automobile Club has now a membership of 140, the increase last year having been forty-eight. During the season nine successful runs were held, the average number of cars attending being fifteen.

MESSRS. RENNIE AND PROSSER, LIMITED, of Glasgow, are establishing a large new motor garage and repair works at 69, M'Alpine Street. A petrol licence has also been obtained, and the firm are now in a position to undertake any class of repair work.

THE Committee of the Yorkshire Automobile Club have had before them a suggestion to establish a club-house and garage at some future date, and, in view of making the suggestion practicable, they are appealing to the members to help them to increase the membership of the Club. At present this stands at 150 members.

THE British Germain Motor-Car Company, Limited, have just supplied a Germain 15-h.p. motor-omnibus, seating twenty-two passengers, to the order of Mr. C. A. Mahore, of Durban, South Africa, for service in that town. At its trial the vehicle with its full load covered a distance of sixteen miles in one hour, and proved itself a good hill-climber.

THE annual meeting of the Cyclists' Touring Club is to be held on Friday, the 13th inst., when the following resolution will be moved on behalf of the Council:—"That, in the opinion of this meeting, it is desirable that the constitution of the Cyclists' Touring Club should be so enlarged as to permit of the admission of automobilists and all other classes of tourists to membership."

THE first meeting of the members of the Royal Commission appointed to inquire into the means of locomotion and transport in London was held on Tuesday at the Middlesex Guildhall, Westminster. The Commission has decided to examine as preliminary witnesses Colonel Sir Herbert Jekyll and Lieut.-Colonel Yorke, of the Board of Trade. It has also been determined that the next meeting for the purpose of taking evidence shall be held on Friday next at eleven a.m.

A BEAUTIFUL showcard for 1903 has been issued by the B. F. Goodrich Company and Single Tube Tyres, Limited, whose catalogue is of interest to motorists. The tyre is constructed to withstand the flints of British roads and can be fitted to any section or make of rim. The Goodrich non-slipping rubbers for detachable tyres are accurately machine-cut at the edges, thus never varying in width, and requiring no trimming off—a point of economy in making up or re-covering tyres.

AN automobile club for the Newcastle district is in course of formation.

A MOTOR-BUS intended for trial by the Exeter Corporation caught fire between that city and Chard last week and was completely destroyed.

THE Motor Mart, Limited, have had a large signboard, 32 feet by 6 feet, erected facing the Euston Road, so that no excuse exists for people passing that way missing the place, where sixty motor-vehicles are on view.

IN connection with the forthcoming Exhibition at the Agricultural Hall there are still a few spaces to let in the Berners Hall, and for these early application should be made to Mr. Charles Cordingley, 39-40, Shoe Lane, E.C.

FOR the 1903 season the Electric Ignition Company of Birmingham have introduced an improved form of their well-known E.I.C. sparking plugs. In these, it will be remembered, the porcelain stem is replaced by a string of mica washers threaded over a central steel stem, and in this position compressed very

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

tightly together, the outside surface being afterward turned up to a slight taper. The stem is thus held in the conical seating without the aid of any packing whatever, so rendering it unbreakable. The alteration in the 1903 pattern is to be found in the sparking points, the earthed point now taking the form shown in Fig. 1. There is consequently more space between the two parts, and consequently less risk of short circuits owing to carbon deposits. Figs. 2, 3, and 4 illustrate the new high-tension wire terminal lately introduced by the same company, by means of which the stripping of the cable is obviated. To connect the terminal the rubber insulation on the cable is cut half an inch in depth, as shown in Fig. 2. The wire of the cable is then inserted into and between the copper clips in the space shown by arrow marked 1, Fig. 3, and the two halves of rubber insulation marked 2 into the spaces 2. Fig. 3 shows the joint completed, the makers claiming that nothing can either break or shake it loose. The arrangement also enables the plug to be taken out of the motor without having to disconnect the wire. The Electric Ignition Company are also introducing a new induction coil for petrol motors, to which we hope to refer in a subsequent issue.

DEVELOPMENTS IN THE AUTOMOBILE.*

THE course of development of the automobile has not proceeded so naturally as it usually does in matters mechanical—as, for example, in regard to the railway locomotive. The fact that one manufacturer has been successful with one type of vehicle has caused the untechnical to think that that *per se* must be the correct type; and the influence of fashion

pioneer carriages is comprised all the inanimate organs upon which the whole evolution has been wrought. Two of the gear-driven vehicles to which I have referred embodied the device—still almost universally prevalent—of a train of toothed wheels sliding into and out of gear laterally. This *train balladeur*, as the French call it, is supposed to have been invented by the late M. Levassor. Such, however, is not the case, for it was invented for use upon a steam carriage by James Watt. Watt's original sketch is still in existence, and is precisely the so-called Panhard gear. It even shows the method of lubrication by drilling a hole longitudinally through the

The Motor-Car in Stag-Hunting.

[Allgemeine Automobil Zeitung.

Count Carl Schonborn, the President of the Austrian Automobile Club, uses his De Dion Voiturette while deer-stalking on his estate at Beregvar. The above illustration shows the Count bearing home a magnificent sporting trophy, a head with sixteen points.

has made itself felt, to the prejudice of equally meritorious vehicles which, however, have not conformed to the fashion of the hour. In 1895 Panhard and Peugeot were typical of the two then prevalent types—the vertical and the horizontal cylinder *genus*. In the Paris-Rouen race also ran a jumpy contrivance propelled by a single cylinder Benz motor, its power transmission being by belting. In the internal economy of these three

shaft, and leading the oil out by lateral holes as required. Levassor tried other expedients, including friction, and no one was more dissatisfied than he with his change-speed gear. I believe his own exclamation was, "*C'est brusque et brutal*," but he added, and herein lies the crux of the whole matter, "*il marche*." This miserable compromise for a gearing of variable ratio works with more or less satisfaction, but always with a fair degree of reliability, and hence its continuance to the present day. Despite the labour which has been fruitlessly expended upon the search for something better, I trust designers will not grow faint-hearted, for had we but a better change.

* From a paper read before the Automobile Club on Friday, February 27th, 1903, by Mr. A. R. Sennett.

speed gear, and did designers but give greater attention to the silencing of their motors, the modern automobile would make far more rapid progress in the appreciation of the general public.

■ The Americans so far are well behind us in everything regarding common road automobilism, with the one exception, that they have in many instances suppressed the Panhard gear, but they have done this somewhat inadequately by failing concurrently to suitably increase the power of their motors. The change-speed mechanism brings us to the transmission beyond it, and here we see evidence of beneficial evolution. In the earlier carriages the power was eventually transmitted to the road wheels by side chains. The advent of the live axle would seem to ring their death knell.

I am quite aware that the production of a live axle which will not "give" and can be kept in correct alignment is not an exactly simple matter, but experience with live axles has already proceeded so far as to entitle us to prognosticate that side chains will soon be cast off permanently—as they are now apt to be temporarily. Chains bring us to wheels—in these we see no startling development. We note, however, the general transition from the suspension, or spider wheel, to the timber spoke, a transition in all probability likely to prove a lasting one.

In most of the more carefully constructed modern automobiles, internal brakes have been very properly made use of, and the crude practice of allowing the weight of the brake straps to lie upon the revolving drums is gradually dying out, being replaced by a more rational arrangement of extraneously supported brake blocks—the latter brakes contrasting very favourably with the French shoe brakes—put on the wrong way up and acting on the rubber tyre—as evidenced in the earlier of the French-built carriages. A notable feature of construction is the pertinacity with which the "Jack-in-the-box" still sticks to his post. This functionary, in the form substantially the same as when it was first invented independently by Pequeur in 1827 and Richard Roberts in 1829, still obtains.

With regard to the framing of self-propelling vehicles, the transition through which this has passed is interesting. For, beginning with timber construction, we find an almost universal reversion to this mode. The majority of the more modern carriages have composite frames consisting of metallic fitch-plates provided with an apology for a flange, produced by setting over the top edge of the medial portion. Not only is the width of flange thus obtained inadequate, but the length of plain fitch-plate left projecting at either end is too great. Having regard to the negligible increase of weight due to the extension of the flange, this should undoubtedly be done. A difficulty, however, presents itself, through the necessity of employing special plant, so that I look upon this merely as a temporary one. The noticeable feature in regard to framing is the gradual discarding of tubular construction. For weighty vehicles I think there can be no doubt that hydraulically pressed up frames produce the best "engineer's job." A plant is now at work in France, and one is being got ready on our side, so that shortly they will be procurable. Perhaps the most scientific form of frame yet introduced is the aluminium rectangular or "box girder," reinforced by a core of ash, made use of by Messrs. Charron, Girardot and Voigt, and the steel one of similar construction made use of by Messrs. Maudslay on our side.

In regard to the motor no startling or radical phase of evolution has presented itself, but there is evidence of healthy progress, the motor of to-day being a far more reliable servant than its progenitors. With regard to the cooling, the latest device consists in discarding the ventilating *louvers* which had come to be an integral part of the bonnet and enclosing the motor within it hermetically, and aspirating air into this closed chamber by means of a centrifugal fan. All this represents common-sense progress, but in connection with it we detect the imprint of the faddist. The cellular—or so-called "honeycomb"—cooler by means of which the circulating water is divided up into thin films constitutes a correctly scientific process of refrigeration analogous indeed to certain other cooling processes. But among things to be avoided on motor-cars are joints. Now the up-to-date cooler may be said to be built up of joints, a vast expanse of soldered joints fairly difficult to make in the shops almost impossible to remake on the road. The ideal water-cooler should only have two joints, those of the induction and eduction pipes. The difference in weight of a well-designed cooler practically free from joints and one dependent upon much soldered jointing is negligible in regard to ordinary vehicles. I should like to point out here that my remarks anent water-cooling and motors are intended to apply only to ordinary cars, and not to racers, in connection with which it is, of course, legitimate to employ any means of weight reduction and speed acceleration likely to bring one first to the winning-post.

(To be concluded.)

A CORRESPONDENT, writing to the "Electrical Review," gives a useful warning with regard to dry batteries. He has lately come across a large number of glass cells imported from the Continent and now being sold in various parts of the country as dry batteries. These apparently are larger, and presumably of much more power than an ordinary E.C.C. or Obach cell, but when tested are found not to give out one-third of the power of either. He has cut open three or four of these glass cells, got up so as to appear to be a *bona-fide* large battery, and found in each only a very small battery, the remainder of the cell being filled with sawdust and resin or pitch.

CORRESPONDENCE.

CHANGING SPEED GEAR WITHOUT NOISE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Do you think the present method of changing the Panhard gears of motors would be very much improved by the fixing of a clutch of the expanding type on the shaft between the speed and differential gears, of course making that shaft in two pieces, so that by throwing the clutch out at the same time as the main clutch in the flywheel, it would bring the whole of the change speed gear to rest and allow the road driving wheels to revolve and the car to run by the impetus it obtained before throwing out the clutch? Gears could be changed without any noise, jar, or trouble, and the clutches let gently in at the will of the driver. It appears to me that the advantages of such an arrangement are many. In the first place, the gear wheels would last as long as the car. Secondly, the greatest novice could change speed without the slightest danger of stripping the teeth. Moreover, the life of the speed shaft bearings would be very much prolonged owing to the absence in the gear box of pieces of steel that are knocked off the teeth to a more or less extent even by the most experienced of drivers. Then there is the danger when mounting a hill of missing the gear altogether; quite a number of serious accidents caused by cars running backwards have occurred through "missing gear." By the system I propose this would be an impossibility.

I should be glad if you would publish this letter in your valued *Journal*, so as to get the opinion of your readers on the subject.—Yours faithfully,

B. CARRINGTON SELLARS.

THE SPARKING PLUG "DISCOVERY."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In using the new spark intensifier, is it not very likely that should there be a leakage of petrol, and just the right amount of air about, a *naked* high-tension spark might not only light up the petrol but blow the car to pieces? The spark at contact breaker is, I suppose, harmless, as it is of low tension. It strikes me that one should ponder awhile before trying this, especially as car owners are fond of flooding their carburettors. Could not the interrupted high-tension wire be enclosed in a thick glass tube?—Yours faithfully,

ARTHUR FENNINGS, M.D.

CLUB AWARDS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Last July we entered certain vehicles in the Automobile Club's Reliability Trials. After the event was over we gained an award, which was to be a gold medal, and have since waited patiently for the Club to make these awards. We think this is rather unsatisfactory that, after all this length of time, no awards should have been given. On Saturday morning last we received a letter from the Club saying the medals were not yet to hand, and as soon as they were they would be forwarded.—Yours truly,

FRISWELL, LTD.

R. W. CHESTER writes re "catalytic ignition" as follows:—"I wish to know whether, after the current has been cut off, the wire maintains its incandescence, thus resembling the old tube ignition, or whether it becomes so at the moment of highest compression, and, if so, why?"

CONSIDERABLE progress is reported as having been made with the projected motor-car racing track at Clacton-on-Sea.

We hear that arrangements are in progress for the conversion of one of the very largest carriage depots in the West End into a garage.

THE Petrol Motor Power Company are opening a show-room for Peerless and Rambler cars at 7 and 9, Carteret Street, Broadway, Westminster. Garage accommodation for about twenty cars is also available.

AT an hotel yard at Windsor, on Sunday last, there were nearly thirty cars, and distributed about the town were many others, while a number of cars passed through, continuing on their way in the drenching rain.

THE Chairman, Mr. S. Andrews, of the Star Omnibus Company, has just told the shareholders that while the directors of the concern are fully aware of the necessity of being in possession of a successful motor-omnibus they are not willing to spend a great sum of money in experiments, a policy which the shareholders have endorsed.

FURIOUS DRIVING CASES.

Bishop's Stortford ...			

Where no alleged speed is given it is understood to be above the legal limit.
*Motor-Cycle Cases.

NO LIGHTS.

A. W. REEVES was summoned at Colchester for driving a motor-car in Crouch Street on February 20th without having a red light attached, so as to show the direction in which the car was proceeding. The Chief Constable said the lamp was fixed in front, and as the car proceeded the light was obscured. The owner of the car had been cautioned in October in respect of the same lamp. Defendant was fined 10s. and 11s. costs.

DR. WALFORD BODIE has been summoned at Blackpool for having no light on his motor-car; but as the offence occurred on a windy night the case was dismissed.

The Up-to-Date Picnic Party.
[Das Schnauferl, Munch]

ALLEGED POLICE PERJURY.

AFTER a hearing lasting some hours, the York City Justices committed to trial, on a charge of perjury, an ex-member of the York City Police named Arthur Robinson, aged 26. The case arose out of a recent prosecution of a motor-car driver, when the accused said he timed the defendant with a stop-watch which he had (at the time of the hearing) left at home. It was stated that after the conviction of the motorist Supt. Woolnough, at the request of the Chief Constable, went with the prisoner to his house for the stop-watch, but was shown a watch from which the second hand was missing, and it was not a stop-watch. At an interview with the Chief Constable afterwards he said he had made a mistake, and produced another watch—a metal stop-watch which was broken. This proved to have been purchased two days after the conviction of the motorist, and the prisoner was suspended, being afterwards dismissed by the Watch Committee. The defence was that the evidence of the prisoner was not material, and therefore was not perjury, as the Lord Mayor, in deciding the case, said they had placed no reliance on snap observations taken by the constable.

CLAIM FOR DAMAGES.

AN interlocutor which decided a very interesting point in connection with the hire of vehicles has just been issued by Sheriff Henderson in Edinburgh Sheriff Court. The action was at the instance of John Burck, joiner, 109, Leith Street, Edinburgh, against the New Rossleigh Cycle and Motor Company, Limited, 6, North Charlotte Street, Edinburgh, for £25. Pursuer, along with six other gentlemen, hired a motor from the defenders for 10th August last to get to Peebles. The statement of the pursuer was that the defenders agreed to let them have the car and a driver for £2 2s. The driver which the defenders supplied was unskilled, and got no wages for the journey, getting tuition instead. An accident occurred, for which damages were claimed, but defender attributed the accident to the reckless conduct of the pursuers. The Sheriff finds that the action is incompetent, it being at the instance of only one of the persons who contracted with the defenders, all of whom had suffered damage. His lordship therefore dismissed the action, and finds the defenders entitled to expenses. In a note the Sheriff remarks that the eight persons would have been entitled to have joined in suing the defenders in one action. The question came to be, were they bound to sue together or were the defenders to be put to the risk of having seven similar actions brought against them? Where there was one contract he was inclined to think that the defenders were entitled to have the full amount of their liability determined in one action.

CLAIM BY A MOTOR-CAR FIRM.

In the King's Bench Division of the High Court of Justice, the Lord Chief Justice and a special jury have had before them a claim on behalf of the Wolseley Tool and Motor Company, who carry on business at Birmingham, against Messrs. Shoolbred and Co., of Tottenham Court Road, W.C., for damages caused to one of their motor-cars in the Euston Road by a collision with a two-horse van, which, it was alleged, resulted from the negligence of the defendants' servants. The defence was a denial of negligence, and it was said the motor-car was injured by turning into a shelter on the roadway. It appeared that on April 26th last the motor-car in question was being driven from the Agricultural Hall, where the plaintiff company were showing cars. The plaintiffs' case was that it was injured by being knocked against the shelter by the defendants' van, and damaged to the extent of £108 odd. The jury disagreed, and were discharged.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, MARCH 14, 1903.

[No. 210.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

LAST WEEK we announced that the King had become patron of the A.C.G.B.I. Now comes the intelligence that the Prince of Wales has become patron of the Norfolk Automobile and Launch Club. This new organisation held a meeting on Saturday, when it was decided to make the Royal Hotel, Norwich, the headquarters of the Club and hold the first Club meet at Yarmouth on the 11th prox. The following officers were elected:—Chairman, Mr. G. M. Chamberlain; Committee: Messrs. E. T. Boardman, Norwich; Ernest Estcourt, Wroxham; H. R. Fletcher, Marlingford; J. Griffin, Norwich; George Sillem, Long Stratton; W. W. R. Spelman, Norwich; also Yarmouth, Lowestoft, and Beccles district, Mr. Chamberlain, Great Yarmouth; King's Lynn district, Mr. Frank Morriss, Lynn; Dereham district, Mr. D. Belding, Dereham; Cromer district, Lieut.-Colonel Forbes-Eden, Sheringham; Thetford district, Rev. J. A. L. Fellowes, Bunwell Rectory. Hon. treasurer, Mr. F. W. Burton Fanning, M.B., St. Faith's Lane, Norwich. Hon. solicitor, Mr. Edmund Reeve, 59, London-street, Norwich. Hon. secretaries: Motor-car Section, Mr. G. N. C. Mann, Bankplain, Norwich; Motor-launch Section, Mr. H. L. Clark, Maid's Head Hotel, Norwich.

Motor-Cars in London.

ALTHOUGH the presence of one motor-car on a cab rank cannot necessarily be regarded as the sign of the future prosperity in that direction—any more than one swallow does not make a summer—it must be recognised that the presence of a few motor-cars on the London streets is a harbinger of an universal movement that will relegate horses to a proper position in the economy of traffic ere long. The "Westminster Gazette" has been making a census of automobiles seen in prominent places in the Metropolis which is of interest as indicating the advance made during the last few years. The plan was to stand for five minutes at certain spots in some of the principal traffic centres in London and count the number of vehicles that passed either way, differentiating between automobiles and those drawn by horses. The result was:—Opposite Charing Cross Post Office—Motor-cars 1, other vehicles 55. Embankment (opposite Hotel Cecil).—Motor-cars 7, others 39. Piccadilly (St. James's Hall).—Motor cars 7, others 61. Knightsbridge (Hyde Park Hotel).—Motors 8, others 59. Entrance to Hyde Park.—Motors 9, others 37. Over Albert Bridge.—Motors 4, others 19. This gives a total of 36 motor-cars and 270 other vehicles. A very fair proportion in view of the youth of the industry in this country.

Automobile Service for Portuguese West Africa.

THERE is now to be seen, on application at the Commercial Intelligence Branch of the Board of Trade, 50, Parliament Street, S.W., any day between the hours of 10 a.m. and 5 p.m. (Saturdays, 10 a.m. to 1 p.m.), a copy of the "Diario do Governo" containing a notice calling for tenders, which will be opened on 25th May next in the Directorate of the Caminhos

de Ferro Ultramarinos, for a concession to establish and work for 15 years lines and services of automobiles for the transport of passengers and merchandise in the districts of Loanda and Lunda (Portuguese West Africa). A provisional deposit of 2,500 milreis, or about £417, is required to qualify any tender.

The Exhibition.

ELSEWHERE we publish some information with regard to reaching the Agricultural Hall, from any of the London termini, which will be of interest to many of the provincial visitors coming to town for the great International Motor-Car Exhibition which will be opened on Saturday next, the 21st. Exhibitors seem determined to do all they can to have the stands ready in good time for the opening hour, and everything has been done to make the event a splendid success. In the last few issues reference has been made to some of the general features of the Exhibition, which is expected to prove the great Business Show of the year. The charge for admission will be one shilling every day except Wednesday, the 25th inst., which will be a special Club day, the admission being half-a-crown.

The Club Discussion.

EVIDENTLY the majority of the members of the Automobile Club recognised that the club-house was really inadequate for the purpose of a representative gathering, as proved by the scant attendance on the 6th inst. Elsewhere we summarize some of the features of the debate, and also give Earl Russell's views rather fully. It is clear that the numbering proposals are doomed, and the point motorists have now to consider is as to whether the alternative suggested on another page will meet the case. It certainly seems a reasonable and sensible way out of the difficulty, and should lead to a useful discussion on the subject in our columns.

Raising the Limit.

WITH regard to the agitation that has been made by the official section of automobilists in favour of numbering we would emphasise the point that time is on our side, and that with the growing popularity of the motor-car among J.P.'s, county councillors and legislators, the reversal of the present state of things is absolutely assured—in a short time. A year ago it seemed impossible that a motor-car road race should be held within the area of the British Empire; but next July will see all the automobile world in Ireland—spectators of a great International contest. Only a few months ago public opinion in New Jersey was against automobiles, but during the last few days the Assembly of the State of New Jersey has passed a Bill permitting motor-cars to travel at the rate of twenty miles an hour in the open country, nine miles in cities, and ten miles an hour in suburbs and near road crossings in the country. The State Senate is expected to concur and the Governor to sign the Bill. Such a step is likely to find imitation elsewhere in the States—and, in a very few years, in this country.

A Hill Climb Abandoned.

THE Nottingham Automobile Club, together with the Leicester and Derby Clubs, had arranged to have their opening run to Nanpantam on Saturday, and to try conclusions in hill-climbing. Despite the unpropitious weather several people journeyed thither from Loughborough, including the Mayoress (Mrs. R. S. Clifford), but the Nottingham Club wired to the effect that heavy rain at Nottingham had brought about the abandonment of the run. Mr. P. S. Clifford, jun., made all the necessary arrangements, and had measured out a mile of hill. Local motorists are hoping that the tests will be made to-day (Saturday), weather permitting.

Motor Boat Race.

AN international cup, to be raced for annually by motor-boats, has been presented to the Automobile Club by Mr. Alfred Harmsworth. The Marine Motor Sub-Committee of the Club are formulating the conditions in connection with the first race. The following decisions have, however, been tentatively arrived at:—(1) That the race shall be for motor-launches not exceeding 40ft. O.A. measurement of hull. (2) That there be no restriction as regards motive power. (3) That all competing boats shall carry two hands, of whom the helmsman must be an amateur (to be defined hereafter). (4) The race to take place in some sheltered water in the United Kingdom, probably in Queenstown Harbour, Cork, just after the Gordon Bennett Cup race, which will be run early in July.

The First South African Motor-Car Meet. (See last issue, page 8.)

An Engineer's Lecture.

ON Saturday, at the Mechanics' Institute, Keighley, Mr. Heseldine, of Leeds lectured before the Association of Engineers on "Internal Combustion Engines for Motor-cars." Mr. H. C. Longsdon, who was in the chair, remarked that in the near future road locomotion would be tremendously changed by the motor-car, and he did not see why Keighley should not have as good a chance in the business of manufacturing motor cars as any other town. Mr. Heseldine, with the aid of excellent diagrams and sections thrown on the screen, gave a lucid and most helpful and enlightening lecture upon the "works" of a motor-car, and on the process by which the cars were propelled. He remarked that anybody who wished to be in the fashion must own a motor-car, and no car was considered of any standing unless it boasted at least 22 horse power. The railway companies were now seriously experimenting with motor-cars, which for their purposes would be built like corridor cars on two large bogie carriages, and would be of 90 or 100 horse-power and driven electrically. If, for instance, the Scotch express were late at York, and a man wished to get to Leeds, he

would arrive when his slow train had left, and would be sent on by one of the light motor-cars at a very considerable speed. It was gratifying to find that eminent mechanical engineers had now taken up the question of motor-cars.

A Club for South Wales.

A NUMBER of gentlemen interested in automobilism met together at the Royal Hotel, Cardiff, on Saturday to form a local automobile club. It was decided the name should be "The South Wales and Monmouthshire Automobile Club," the president for the year being Lord Windsor, who is himself an ardent motorist and the owner of a 12-h.p. Daimler. There were present Messrs. Godfrey Clark, Llantrisant, who presided; L. Gottwaltz, Penarth; Dr. Pritchard, Cardiff; D. J. G. Thomas, Hirwain; M. de Soldenhoff, Cardiff; A. L. Dowis, Cardiff; G. B. T. Nicholl, Newport; W. Parker Thomas, Cardiff; Victor E. Brukewich, Cardiff; G. L. Watson, Newport; Charles F. Peaty, Cardiff; A. J. Duchmin, Barry; Rees Jones, Barry; Harry Cousins, Penarth; J. J. Neale, Penarth; R. Clay, Cardiff; and H. West, Cardiff. Mr. T. P. Appleby, Penarth, is acting as hon. secretary to the new Club, which already has a membership of 56.

The Oxford Club.

A MEETING of the Oxford and District Automobile Club has been held at the Clarendon Hotel, to hear a paper by Dr. Turrell in justification of his contention "that at the present time a motor-cycle is the only form of car suitable for a man of moderate means." The doctor prefaced his remarks by defining a man of moderate means as one whose income enabled him to reserve £100 a year to spend on his pleasures after all the necessities of life had been provided. The first official run of the Club took place to Wallingford and Benson. Later in the day a dinner was held at Oxford, Mr. C. Rippon, the president, who was in the chair, expressing his satisfaction that they had had such a good run. He hoped it would be the first of a series which would be equally successful. Speaking of the Club, he remarked that at present they had 51 members, and he thought that was a very good start indeed. They were fortunate, too, in having members from outside Oxford, five coming from Reading and some from London. In the run that day, seventeen vehicles had taken part, and he was sure many Clubs of greater age and standing would have been satisfied with such a result.

A French Preference.

EVIDENTLY, even in France, the automobile will not entirely displace the horse, for the chairman of Messrs. Harrison, Barber and Company, the well-known horse-slaughters, at the annual meeting of the company the other day, said one thing which had affected them was the French taste for horse-flesh, some of the French people preferring a steak from a horse rather than one from an ox. That trade seemed to be a very steady one. If a horse could not walk, say, 30s. might be obtained for it at the knackers; but if the owner could get it to walk to the steamer, and export it, in Paris he could get £6 upon it; therefore a considerable profit was made on the transaction, while the English horse-slaughterer lost the chance of an operation—an interesting side-light on the Economy of the Equine.

The Irish Club.

THE annual general meeting of the Irish Automobile Club was held at Dublin a few days ago, the chair being taken by the Right Hon. Horace Plunket, president. The Secretary submitted the report of the Committee for the year 1902, which showed that the Club had prospered considerably during the past year, and was in an excellent financial position. The election of officers for the ensuing twelve months resulted as

follows:—President, Right Hon. Horace Plunket; chairman, Mr. W. G. D. Goff, J.P.; hon. secretary and treasurer, Mr. R. J. Meeredy. The members of the committee who were elected included the Marquis of Waterford, Lord Louth, Lord Plunket, Sir H. Robinson, K.C.B., and Colonel Chaloner Knox.

Dublin Headquarters.

In connection with the Gordon Bennett race the Chairman stated that the Irish Club had secured for the purpose of a garage and Club rooms the magnificent premises of the Earlsfoot Terrace Rink, Dublin, for a period of three months from the 1st of June next. These premises will afford accommodation of the very best kind for a very large number of cars, in addition to dressing-rooms, reading-rooms, etc., and will prove a great convenience both to members of the Club and the visitors from England and abroad. Mr. Plunket added that it was the determination of the Club to make every effort to extend a real hearty Irish welcome to their fellow automobilists, who would, no doubt, be present in large numbers. The Club are very fortunate in securing such admirable premises for this event, they being centrally situated and most commodious.

The Sheffield Club's Run.

It was a venturesome journey undertaken by the Sheffield Club on the occasion of their run to Dunford Bridge, the roads to which resemble those over Shap Fell, made all the more familiar by the presence of snow. Seven cars, three motor-tricycles and a quad carried twenty passengers, whose experiences were extremely varied. Mr. J. Barber's 12-h.p. Belsize towed two of the tricycles, one member sat on the bonnet of his car—to keep the carburettor from freezing, as he said—and something going wrong with the mechanism of the Secretary's car, caused the vehicle to refuse to travel forward; so, utilising the reverse, he went to his destination backward.

The Edison Accumulator.

MR. H. E. DICK, who is associated with Mr. Edison, has been in London recently, and had with him specimens of the new Edison automobile accumulator. The cell weighed 18 lbs., and had a 200-watt capacity. Noticeable features are the small distance between the plates, and the compact arrangement in all other respects. In external appearance it has one great advantage over the ordinary lead cells; the containing box, being of nickelled steel, looks much stronger than the wood or

Photo by]

The Sheffield Automobile Club at Dunford Bridge.

[Mr. J. Hudson Ligo.

Over the Course.

EARLY preparations for the great race in Ireland are being made, and on the 17th inst. the proposed course will be inspected. The Committee will arrange control stations, and go into the matter of providing for the safety of the public on the day of the race. They will be accompanied by the County Surveyors of Kildare and Queen's County, to whom all the defective portions of the course will be pointed out. A considerable amount of money will be spent in making the route as safe and as practicable for high speeds as possible. It is probable that the course between Carlow and Athy will be altered, and some portions near Kileullen may be neutralised. At a meeting of the Holywood Urban Council, the other evening, the Chairman said, with reference to the forthcoming motor race for the Gordon Bennett Cup, he had for some time past been in communication with the Automobile Club of Great Britain and Ireland with reference to their holding a hill-climbing contest at Holywood on the hill leading past the waterworks. The gradient on this hill was 1 in 6, and as 1 in 9 was about as much as a motor-car could manage, the Club was compelled to decline the invitation.

ebonite boxes commonly seen. The general result of an examination of the cell is, remarks Mr. W. Hibbert in the "Electrical Review," to remove some antecedent scepticism, and one feels that there is a serious competition to the lead cell not far away. The final decision will appear when the cells are offered to the public, and get tried by the infinitely varied rough usage and nescience of the general public.

Glasgow to London.

THE non-stop run organised by the Western Section of the Scottish Automobile should be a useful minor event in a year of great things. The object of the trial is to show the average individual that, with reasonable rest, Glasgow and London are within two days' car run of one another. The principle underlying the rules is that the trial is a test of reliability. No advantage, from the point of view of marks, will be obtained by a vehicle which travels at more than twelve miles an hour. Marks will be deducted for all stops other than those for traffic. Speed in excess of that required to gain the maximum marks (viz., twelve miles per hour on the open road, and eight miles per hour, or less, in traffic) will therefore be useless. The number of

cars of any particular type and horse-power entered by a manufacturer or agent is limited to two, and all entries must be made to Mr. R. J. Smith, hon. secretary, before the 13th prox. There will be a compulsory stop at Leeds, and should the entries prove numerous the occasion might be made the opportunity for a joint gathering of the Scottish and Yorkshire Clubs in that town. Should the number of entries be considered insufficient by the Committee the trial may be cancelled; but it is to be hoped that the event will, on the contrary, attract a large muster.

Leyland's Motor Fire Engine.

THE little town of Leyland has now its motor fire engine, this having been delivered within the last few days. On the day of its arrival it set out to quell a purely supposititious fire, which was located at a big mill about a mile from the town. As the red and yellow engine whizzed through the long High Street all the doors and windows were full of wondering faces. The engine came to a rest in the yard, the hose was run out and connected with the mill pond, and soon the water began to "play" in vigorous style. The two jets played against a towering chimney, which was imagined to be wrapped in flame. The full power of the hose could not be seen, as the wind blew the water at the tips of the jets into spray. It is said that the engine will force one jet of water 190 ft. high, and two jets 150 ft. The officials of several Lancashire fire brigades were present at the display.

Wrongly Using Cars.

A CHAUFFEUR employed by a well-known Parisian motorist was privately entertaining his friends in his employer's motor-car recently, when he ran into a passing vehicle. The driver was seriously injured, and also the four passengers, one of them being impaled on the shaft of the vehicle and dying instantaneously. It is a rather remarkable fact that three or four motor-car accidents which have occurred in this country have been on somewhat similar lines to this particular case, mechanics having taken out, unknown to their employers, parties of friends, and apparently growing reckless, if not wilful, in their driving. Motorists will have to adopt rigid regulations on this point, and provincial clubs should officially urge their members to exercise restraint over employees likely to take cars out for private parties.

Prevention of Corruption.

IN moving the second reading of the Prevention of Corruption Bill in the House of Lords, on Tuesday, the Lord Chancellor said the latest unpleasant development of secret commissions was in the motor-car industry. Motor cars were very complicated pieces of machinery, and required great care on the part of those who managed them; and the form of secret commission adopted in this case consisted in a payment to the person who was responsible to his employer for the care of the machine on the annual bill for repairs. Under such circumstances nobody would suppose that the motor would be very well cared for. In the course of the discussion Lord Alverstone pointed out that there were many honourable trades in which the remuneration was solely by commission, and therefore it was absolutely necessary to retain the word "corruptly" so that the Bill might affect only the agent who secretly paid commissions for the purpose of influencing persons to buy his master's goods. The Bill was read a second time.

In South Africa.

WE learn of considerable activity in the motor-car trade of South Africa. Quite a large number of White steam cars are seen in Johannesburg, where the local Motor-Car Company have a fine garage under the management of Mr. Frank Whittaker, and act as local agents for the Cudell cars. Mr. Graaf, the millionaire director of the South African Cold

Storage Co., has a 12-h.p. car and a 22-h.p. Daimler on its way.

The Scottish Club.

ON Monday, Mr. William Weir read a paper on "Possible Developments in Automobility" to the members of the Scottish Club (Western Section). A comparison was instituted between automobile cabs and horse-driven cabs for ordinary hiring purposes, the net result of which was to show the large gain in economy by the use of automobiles. The relative figures, including all items of cost, were given as for the horse cabs, practically 6d. per mile run, and for the automobiles slightly under 4d. per mile run. An outline was also given of the procedure to be adopted in running the automobiles, and it was also pointed out that public garages would prove the best repair shops for private owners. Consideration was given to the relative values of petrol, steam, and electricity.

The Irish Week.

EVERYTHING looks well for the automobile week in Ireland in July. Lord Londonderry is taking charge of the Bill to legalise the Gordon Bennett race in its passage through the Upper Chamber, and the directors of the Phoenix Park Club Races have decided to allow the Automobile Club to organise a gymkhana on their racecourse. They are also offering prizes to the value of £250 in connection with the event. Meanwhile the fund raised by the Automobile Club for the improvement of the highway over which the race will be run is steadily advancing, and the latest subscriptions received by the Secretary at 119, Piccadilly, W., have raised the total to £232. We hope this will be materially increased during the next few days, and that many of our readers will respond to the invitation to send 10s. towards making the coming race a really great event.

At a meeting held in Paris on Tuesday the formation of a Motor Cycle Club was decided upon.

It is reported that a company has just been formed in New York, with a capital of £540,000, to build "Mercedes" cars in the United States.

MR. ARGENT ARCHER has been appointed official photographer for the Motor-Car Exhibition which opens at the Agricultural Hall, London, on Saturday next, 21st inst.

MR. SCHWAB, the president of the American Steel Trust, visited the works of Messrs. Charron, Girardot, and Voigt last week, and placed an order for a 80-h.p. eight-cylinder car.

THE directors of Vickers, Sons and Maxim, Limited, report that the Wolseley Motor-Car Works, mentioned for the first time in last year's report, have given a fair profit on the capital invested, and this the directors confidently hope will be increased now that the organisation for the manufacture of motor-cars on a large scale has been properly developed.

VICKERS'S NEWSPAPER GAZETTEER for 1903 is the fourth annual issue of the work, which appears to have been prepared with much care. Recent revision and correction have given the work a value to every business office interested in newspaper work or in constant communication with the Press. The volume contains a complete alphabetical list of the newspapers of the United Kingdom and also a classified list of all the journals, reviews and periodicals, etc.

A PLEASANT run of the Yorkshire Club was held on Saturday to the old-fashioned town of Wetherby. The meet was at Harewood, and at 2.30 the following members and friends had arrived:—Mr. H. P. Kirk, 12-h.p. Gladiator; Mr. Atkinson, 11-h.p. Clement; Mr. and Miss Armitage, 11-h.p. Clement; Mr. Bayliss, Sunbeam car; Mr. A. W. Dougill (hon. sec.), 8-h.p. Loidis; Mr. and Mrs. Winn, Renault; Mr. Wharam and Mr. Borland, 4½-h.p. Renault; Mr. Roslington, 9-h.p. De Dion; Mr. Milner, Argyll; Mr. Pepper, 12-h.p. Belsize; Mr. Barton, Darraq; Mr. Bottomley, Boyer; and Mr. Smith, Gladiator.

"NUMBERING" MOTOR-CARS.

MOTORISTS are not a happy band, for while their pastime is a pleasurable one to practise, in certain districts it leads to the publicity of the police-court and the expense of legal proceedings. Carefully travelling a country lane, they may be suddenly pounced upon by a myrmidon of the law, whose exaggerated view of self-importance enables him to become insolent without outside provocation. And to answer such impudence according to its deserts may lead to consequences unforeseen—for the support of the magistrates is generally accorded those who walk in blue, and hide behind hedgerows, waiting for opportunities of swelling the County Funds by securing convictions against motorists.

Such being the case, and having regard to the truculent attitude of the County Councils, eighteen months ago, the committee of the Automobile Club decided to do Something, and in order that the proposals of experienced persons should be considered so as to effectively pass through the Houses of Parliament, a legislative committee was formed to suggest what that Something should be. After many conferences and consultations, suggestions for a new Act of Parliament—an up-to-date Magna Charta for motorists—were adopted by the committee of the Club, and sent to the wide world in the name of the Automobile Club of Great Britain and Ireland. Some of these proposals were contrary to the spirit and policy of the Club a few months before—but what of that? Something had to be done, and here was the Something.

So far unanimity had been secured—or, as least, opposition had not been allowed to penetrate from within the inner councils of the Legislative Committee. But when it was found that proposals were made for labelling cars like cabs, and numbering pleasure vehicles as though they were trams, murmurs of discontent were heard. These found expression in the automobile press, were emphatically urged at various discussions of provincial clubs, and were the subject of correspondence to the central club, all of which did not find its way into the official organ of that body. A year dragged along, and the Club's committee took little notice of the tide of opposition that steadily rose against such ideas being given forth as the views of automobilists. At length it was announced that a meeting would be held at the Club-house to discuss the matter; and then the storm broke forth. For the premises in Piccadilly would never hold a tithe of the opponents—practical and representative—to the restrictive and unwise proposals. This feeling grew upon the leaders of the Club, and in their organ it was declared that "in consequence of the number of applications already received for seats at the house dinner on that night, the executive committee have decided that further applications for seats for guests at the dinner on this occasion cannot be entertained, as it is feared that guests might occupy seats to the exclusion of members." Thus was it expected that a great crowd would be present to support the committee of the Club.

But, alas! on Friday last there was little evidence of any widespread desire to number cars, and the meagre attendance—eighty persons at the outside—revealed that few cared what was done. Many well-known motorists, recognising that the meeting could not be conclusive, stayed away; others felt that there was no need for the agitation, and, acting on the principle

of letting sleeping dogs lie, absented themselves as a protest against the policy proclaimed in the name of the Club by the committee. Mr. R. W. Wallace, K.C., presided, being supported by only a few members of the committee and faced by sixty or seventy gentlemen, whose attitude proved to be one of uncompromising opposition. Having briefly opened the meeting, he called on Mr. Johnson to read letters received from Mr. Arthur Stanley, M.P., Mr. Arthur Pearson, and Mr. E. Reynolds, of Sheffield, in favour of the committee's action, and Mr. W. Hurst, of Sheffield, who declared against such suggestions.

The legislative proposals having been put forward as recommendations, Earl Russell rose to criticise. His speech was quite refreshing, the experienced debater being evidenced as he marshalled his points with a good humour and raillery that delighted his audience and proved irresistible in raising a smile on the faces of those whose views were dissected into shreds. He complained that the members of the Club had not been taken into confidence, that no opportunity of meeting for discussion had been provided, and that the Club proposals had been published before the members had had an opportunity of understanding them. The chairman was twitted as to the care taken to absolve Mr. Montagu from the paternity of the Bill, and the speaker wondered if that meant that the committee

were no longer proud of their offspring. The form of the Bill was criticised. One clause provided for the right of appeal to the High Courts, but it was also said that "the person convicted may appeal on matters of evidence." Ordinarily such an appeal was to Quarter Sessions, and they were not improving their position by going before thirty prejudiced magistrates after being convicted by three. Dealing with numbers, we were reminded that "a Government is not over ready to introduce legislation that it can get out of introducing," and it was unlikely that any legislation would be carried through by anyone but motorists. If they preserved a neutral attitude there would be no chance of any Bill passing for five years. Prejudice was decreasing. If numbers were once adopted it would be practically impossible to get them off. It was a proposal that might have been expected from the police authorities, and he strongly

condemned it as unpractical, concluding by suggesting that a ballot of the members of the Club should be taken on the subject.

The discussion then became general, but one-sided. Mr. E. Midgley did not want to be numbered. Mr. R. Todd thought that in approving of numbering, motorists were giving more than they would obtain in return. Mr. C. Jarrott urged that nothing should be done until the Government brought in a Bill, and denounced numbering as tending to restrict trade. Mr. A. E. Cohen thought they might go forward to secure the abolition of the speed limit without suggesting the numbering idea. They should remember that at present they were a small proportion of the people.

Then Mr. Montagu gave a history of the matter which had led to his name being attached to the Bill, and declared his willingness to do whatever the Club wished in the matter, but submitted that some alternative would have to be proposed—a view emphasised by Mr. Staplee Firth. It was evident that "numbering" had not a friend in the room, and on the submission of a resolution to take a ballot, not a single hand was held up in opposition. Earl Russell and his friends secured a victory, and well deserve the thanks of the many provincial clubs, whose hostility to the measure has been somewhat ignored in London.

Photo by

Earl Russell, L.C.C.

[Russell and Sons.]

It was finally resolved to take a postal ballot of the whole membership of the Club on three points, whether there should be identification with removal of the speed limit; whether they should try to secure the removal of the speed limit without identification; or whether matters should be left as they are.

INTERVIEW WITH EARL RUSSELL,

On the morning following the discussion of the Club, our representative called on Earl Russell at his chambers in town and found him well content with the result of his opposition, as the following report of the conversation indicates.

"As soon as I saw the proposals," said his lordship, "I realised that they would be harmful to the industry and the pastime. The man who wants to go forty miles an hour along the highway will do so whether he is numbered or not. The driver at such a pace cares nothing for others on the road, and would smear his number with vaseline to retain the dust that flew up, or hang his coat over the identifying figures, with the result that the police were no better off, while innocent motorists would run the risk of being summoned."

"Doubtless the ingenuity of the wily motorist would be equal to the occasion, but why have these proposals been so long before the country with the official *imprimatur*?"

"That is more than I can tell. But I wrote to the Committee protesting, and suggesting that the views of the members should be ascertained. They took no action, and it was only when the opposition became general that it was decided to hold a meeting, and there, as you saw, the Committee had few friends. In fact, the series of observations made by the Chairman during the progress of the debate prepared the way for the final capitulation and his support being accorded to the resolution in favour of a ballot among the members."

"But, failing numbering, does not some alternative seem to be necessary in view of the very prejudiced feeling which prevails in official quarters with regard to motor-cars?" I queried.

"Yes, I quite agree," was the reply; "and the suggestion I have already made seems to me a feasible one for getting over the difficulty. A small metal plate, say, about the size of half-a-crown, bearing the name and address of the owner of the car, might be placed in some inconspicuous position on the dashboard or on the seat. Thus, when the car came to a standstill the local policeman could very easily identify the owner. The point is that a large number on the back of the car—whether three inches or three feet in height—could be easily obscured, and its purpose frustrated altogether. From the æsthetic point of view, too, much can be said, but evidently it is too apparent to motorists to need much emphasis."

"Some time ago, I believe, you secured the prosecution of the owner of a horse which was left unattended on the roadside; and it may become necessary for motorists generally to follow your example in carrying the war into the enemy's camp."

"You remember that case? Well, if horse owners do not show some toleration to motorists, a few such salutary lessons could be rightly and usefully applied. But there is another thing that motorists might do which would probably be effectual in ridding them of many of the difficulties they now have to encounter."

"What is that?"

"You will probably have seen that it is often the boast of chief constables at meetings of their County Councils that they have been able to secure so many hundred pounds for the county funds as a result of the fines imposed upon motorists. How would it be if a dozen or a score of car owners in any one given county would agree not to pay the fines, but to go to prison instead? In that case the Chief Constable, instead of adding so much to the credit of the county, would probably be asked to prepare a statement of the expense of keeping a score of motorists out of the county funds for no other offence than that they moved rather quicker upon the roadway than the driver of an ordinary horse-drawn wagonette."

The suggestion might usefully be considered, and possibly acted upon, the only difficulty being as to who would venture to make the first batch of new motor victims. I asked Earl Russell his view as to what course should now be taken by those actively interested in the numbering crusade, and we finished our chat with his assurance that the minds of motorists generally were so made up on the point that he had the utmost confidence that the ballot about to be taken by the Club will reveal to the Committee how much their proposals have been out of sympathy with the great bulk of practical motorists in the country. Earl Russell has no sympathy at all with the mad drivers who career about the country heedless of the convenience of others—in fact, he would increase the fines imposed on those people to £50, if need be, with imprisonment on commission of the second offence. But he is anxious that innocent motorists who have not imperilled life or limb on the highway, or proved themselves a nuisance, should not be made to suffer. In his view, and all will agree, this would be the inevitable result if any system of numbering were adopted. In fact, it has already been proved to have been the case in France. Motorists, by promptly replying to the official communications they will shortly receive, can do something to prevent the extension of that system to the United Kingdom.

A LEYLAND STEAM WAGON FOR EAST AFRICA.

THE illustration on page 25 depicts a special steam wagon recently built by the Lancashire Steam Motor Company to the order of the African Lakes Corporation, Limited, for use on very bad roads in East Africa. The boiler, which is adapted to burn wood as fuel, has a very large amount of heating surface and grate area. At the trials it was found that the boiler when burning wood fuel was quite capable of making more steam than was ever required by the engine. The platform of the vehicle is 13 ft. long by 6 ft. 6 in., and is built of teak throughout. There is an awning of timber covered with zinc from end to end of the machine. The frame is exceedingly strong, and is constructed of channel steel. The driving wheels are of the ordinary traction engine type, 4 ft. 6 in. diameter by 12 in. wide. The whole of the gearing and drive runs in an oil bath, a very important feature in the construction of wagons for use on sandy roads such as are found in Africa. The wagon, which is fitted with two speeds, equal to 5 and 2½ miles per hour, was well tested on grass fields in England before being despatched to Africa, and it was found that there was ample power to deal with a load under almost any conditions. The steering gear enables the wagon to turn a complete circle in a thoroughfare 36 ft. wide. The water capacity is sufficient for a run of about 20 miles, and the fuel bunkers hold enough wood for about the same distance.

THE German Reichstag has voted a sum of £14,000 for the purchase of motor-cars for the army.

HIS MAJESTY THE KING drove in a motor-car to Sandown Park to see his horse Ambush II. run in the race for the Gold Cup. The weather was cold and sharp, with a brilliant sun at times, but the vehicle was well protected from the wind, and his Majesty looked in remarkably good health.

MESSRS. J. ROTHSCHILD ET FILS LIMITED, have removed a portion of their carriage body works to more extensive premises at 45, Page Street, Westminster. Their latest type of body is to be known as "The Shrewsbury Phaeton" and is devised to permit access to all parts of the carriage from the side without the necessity of turning over seats. Another feature is that the back is considerably higher than previously made and is so constructed as to be a greater protection from dust.

CONTINENTAL NOTES.

BY "AUTOMAN."

MR. H. R. KIRK, who drew No. 17 in the ballot for order of starting in the Paris-Madrid race, has selected Mr. Rowland Winn, of Leeds, to drive his Napier car in the contest. The course has been definitely fixed as follows:—Versailles to Bordeaux, 552 kilometres (342 miles), Pessac to Vittoria, and Vittoria to Madrid. The distances in Spain have not been calculated, and the roads there have yet to be traversed by M. Tampier, but they have already been carefully gone over by an official of the Royal Spanish Club and recognised to be fairly good. A special train is being arranged for the Press and for those who wish to follow the race in the "grand frère," as the railway is called in motor circles in France. The ticket will cost about £9.

THE question is frequently asked how long will it be before the supply of cars is equal to the demand? Every day new

the home of these vehicles is not in America but in France. It is in Europe where the motor-car has the greatest popularity and is the most useful; and the greatest demand will always be in Europe. In addition to these the requirements of the motor for America and Europe are different, and specially great is the difference between France and America. The roads in the former country are so flat, and wide, and straight, and well kept, that the steam or electric runabout is of special use, whilst in the latter country the powerful and long-staying touring petrol car cannot be used as it should be. The natural consequence of this is not that it means a case of sending to Europe the surplus production of an already great local trade; but rather is it a case of making a special manufacture for exportation, and as the motor trade is not yet in a stable definite condition, and as great changes are taking place from month to month and year to year—changes which soon get talked about, so that in a short time all the manufacturers have heard of them and can begin to study them—it will be difficult, if not impossible, for the Americans to follow European trade close enough for them to influence it very seriously.

The Leyland Steam Wagon for East Africa. (See Page 24.)

firms seem to be entering the trade, and to those who only make a superficial observation, it seems that this state of affairs cannot last long, and that soon the markets will be flooded. Then there will be a slump in the prices. Recently the firm of Hotchkiss, who were practically the originators of the automatic quick-firing gun, went into the trade, and now comes the news that the Krupp firm, of Essen, are going to make a steam car. Both firms are well equipped, and their entry into the industry has led many to reflect. The French trade fear an American invasion of motor cars turned out in colossal quantities, made of interchangeable parts, systematised and standardised, and much below the French cost price. There is not much danger to be feared from this source. The Americans never could get hold of the bicycle trade, and for a very good reason, which also applies to the motor trade. America always excels, and will always excel, in dumping into the European markets enormous surplus quantities of goods for which the great demand "in America" has already been the cause of the foundation of immense factories.

WITH regard to automobiles it must be remembered that

THERE, however, remains one question of demand and supply, and in considering this I have been making a short study of the latest statistics published by the "Auto," taken from the French taxing offices. The figures, although applying to 1903, must be taken obviously as referring more correctly to 1902. With regard to self-propelled vehicles, there were 1,438 motor-cars in France in 1898. To-day there are 8,207, or an increase of 6,769 in four years, that is to say, 1,692 per year, or about 20 per week. Now, I think that everyone will admit that 20 motor-cars per week as the supply of new motor-cars for a country like France is as a drop of water in the ocean, and this fact is accentuated if we go a little further into the figures and separate Paris and the provinces, for on the latest reckoning Paris has 1,673 motor-cars and the provinces 6,534, that is to say, roughly speaking, Paris takes twenty per cent. of the motor-cars and the provinces eighty per cent., so that out of the twenty cars per week average sold for the last four years, Paris bought four cars and the whole of the rest of France sixteen cars. Regarded in this manner one can better realise how small and insignificant the trade is at present in comparison with what it may be.

IN France there are 2,800,793 vehicles propelled by animal traction, and there are 5,100,694 beasts of burden, that is to say, horses, donkeys, mules, and bullocks. There is, therefore, one motor-car for every 341 vehicles propelled by animal traction. A rough estimate of the horse-power of the motor-cars in France may be taken to be 50,000 h.p., or one horse-power for every hundred traction animals; in other words, there is less than one-third of one per cent. of motor-cars and less than one per cent. of horse-power (figuratively speaking). The business is, therefore, in its infancy. It has only just begun, and only the very outside fringe of the demand has yet been touched. The number of motor-vehicles in demand may reach 10 per cent. of those propelled by animal traction, and if I may be permitted to make this proposition it would bring the total up to 280,079, or, deducting those that exist at present, it would leave room for 271,872 new cars.

ALL this refers to the demand, but what shall be said about the supply? Panhard and Levassor are reputed to turn out 1,200 cars a year, and M. Darracq expects to make 1,000 cars in 1903. No other makers approach these figures, and certainly 10,000 cars per year are not being made in France

THE management of the French end of the concern will remain for some years in the hands of the present staff and under the direction of M. Darracq himself.

LAST Saturday a most imposing automobile demonstration was made at Charlottenburg, near Berlin, on the opening of the Berlin Motor-Car Exhibition, which was inaugurated by Prince Henry of Prussia. At six o'clock in the evening no less than 307 motor-cars, decorated and illuminated, proceeded in line to the Emperor's Palace, to be reviewed by him. In the cars were seated an illustrious crowd, amongst whom were General and Mrs. Becker, Prince Frederic Leopold, the Prince of Hohenlohe, the Duke and Duchess of Ratibor. At the Emperor's Palace the Duke of Ratibor presented to His Majesty an album containing the names of all the participants.

THE leading French firms are preserving great reticence with regard to their 1903 racing cars. *La France Automobile*, however, states that the Mors vehicles will develop over 100-h.p. and have a Jenatz magnetic clutch. The De Dietrich racer is credited with only a 40-h.p. motor, but it is said that the general outline of the vehicle will be on new lines

Fig. 1.—The Rochet 12-h.p. Car. (See Page 27.)

to-day and even if that figure was the correct one, at least one-half are being exported, whilst the importations are so small that, apart from 200 Mercedes, they may be considered as nothing. If, therefore, we assume that the present supply of French cars for sale in France is 6,000 per annum, it would take a little over forty-five years for the supply to catch up to the demand, and this seems to leave ample room for production to be increased by the existing makers, and also for new builders to join in the trade.

THERE may of course be, and no doubt will be, occasional slumps of short duration, but I think that, taking the above figures into consideration, and also remembering that the delivery wagon and public service side of the industry has not yet been seriously commenced, at least ten years of good trade in motor-cars may reasonably be expected.

THE business of the Darracq Company, including the works at Suresnes, has been sold to an English group. The whole of the arrangements have now been made, and the business is transferred to its new holders, who are a limited company, amongst the large shareholders of which is Mr. Avery, of Birmingham.

with the view of reducing the air resistance to a minimum. Finally it is hinted that the Panhard racer will be on the lines of the Paris-Vienna cars.

AT the International Automobile Exhibition opened in the building known as La Flora, at Charlottenburg, near Berlin, on Saturday last, there are altogether about 1100 exhibitors, including the Cannstatt Daimler, Protos, Adler, Cudell, Bergmann, Stoewer, and Continental Caoutchouc Companies.

THE Automobile Club of Holland has just held its annual meeting. The club, which has now a membership of 154, is organising a reliability trial for August next on the lines of that held by the A.C.G.B.I. last year.

DURING the Reliability Trials last year a horse was killed between Hildenborough and Tonbridge. The owner brought an action against the owners of the motor-car [that offended in the matter, and has obtained judgment for £75—not a bad price for a horse.

THE Index to Vol. IV. of the *Journal* will be published with next week's issue, which will be on sale at the Motor-Car Exhibition, at the Agricultural Hall, London, N.

THE ROCHET 12-H.P. CAR.

FOR the 1903 season the Rochet Company, of Paris, have introduced a new 12-h.p. four-cylinder car, of which we are able to publish a general view (Fig. 1) on p. 26. The frame is of wood and steel; it carries in the fore part a four-cylinder motor, the cylinders being 88 mm. diameter by 110 mm. stroke. The usual form of electrical ignition is adopted, while the mixture is furnished by a spray carburettor of the company's own design. The water circulation for the cooling of the motor is maintained by a pump and radiator, the latter being of the usual ribbed

Fig. 2.—The Rochet Change-speed Gear.

type, but set in a frame in front of a square bonnet. The engine is provided with a governor acting on the admission; an "accelerator" and "moderator" are also fitted, by means of which the speed of the motor can be regulated as desired.

Coming now to the transmission, four speeds forward and a reverse are provided, these being all actuated by a single lever. The engine is connected to the gear-box through a cone clutch, the power then being conveyed to the rear road wheels through a differential counter-shaft and two side chains. A section of the change speed gear is given in Fig. 2, from an observation of which it will be seen that on the top speed the power is transmitted direct, none of the gear wheels being in action. E is the male portion of the clutch connected with the motor fly-wheel; it is mounted on the end of the shaft F, which also carries a sliding train of pinions. On the side shaft G is a second sliding train, the object of which is to unmesh all the pinions on F when driving on the top speed. The fork I which controls the sliding train on the shaft F is rigidly connected to the lever H; on the latter is loosely mounted a fork J, which controls the train C', B', DR'; a spring tends to force this latter continually to the left. The gear train B', DR' is limited in its movement to the left, first by the piece I, the position of which is determined by that of the upper train, and secondly by the pinion C', against which the face of the wheel B' bears when at the end of its leftward movement. The pinion DR is mounted loosely on a sleeve on the shaft F, the sleeve also carrying on its end the bevel gear which transmits the power to the differential shaft M. For the first three speeds the pinion DR' is in mesh with DR, but on the fourth they are disconnected. To give the first speed, pinion A is connected with A' and DR' with DR; for the second speed C meshes with C', DR' still being connected with DR; and for the third the power is conveyed through B, B' and DR', DR. The fourth, direct, speed is obtained as shown in Fig. 1, the sliding train on the shaft F being moved to the right until the jaw clutch K is brought into contact; the train B' DR' is simultaneously moved to the right, and all the pinions disconnected, so that the shaft G no longer rotates. To obtain the reverse motion, the upper sliding train is moved to the extreme left until the pinion A meshes with that marked A'; at the same time the side of pinion C is brought into contact with the small gear wheel C', and pushes it to the left until it meshes with A'; the power

is then transmitted in a reverse direction through pinions A, A' and C', A' DR' and DR.

Inclined wheel-steering, hand and foot double-acting brakes, are other features of the car, which is mounted on artillery wheels shod with 820 mm. by 120 mm. pneumatic tyres. It weighs about 18½ cwt., and can attain a speed on good roads of 40 miles per hour. We may add that the agents for the Rochet cars in this country are the British and Foreign Motor-Car Company, Limited, of Liverpool, and the New Automobile Company, of London.

THE G.O.M. CARBURETTOR.

HEREWITH is given a sectional view of a new float-feed carburettor lately put on the market by Messrs. John Child Meredith, Limited. As will be seen, it consists of a chamber A, in which is a float B, that keeps the liquid at a constant level, and the needle E, which stops the arrival of the petrol when the proper level is attained. The spirit arrives through the canal D, connected with the main reservoir; the air enters at E, and the gas is sucked through the canal F, connected with the inlet valve. At each aspiration of the motor the spirit rushes through the small hole of the passage I, and is intimately mixed with the air entering at E. Some bubbling takes place in the space M, which mixes the petrol and air intimately. After a charge of spirit has been drawn up from the chamber A, the float drops down and bears on the counter-balance of the needle C, which lifts up to admit a quantity of petrol equal to that which has left the chamber. The only adjustment necessary is done by the tap V, the location of which regulates the quantity of air admitted. The position of the tap is determined when the fewer number of explosions is obtained for a certain quantity of liquid. To mix alcohol (when this is used instead of petrol), with the air more intimately, the canal carrying the gas to the inlet valve is surrounded by a

jacket in which part of the exhaust gases is admitted, or the cooling water used for the engine, which permits of the proper temperature being obtained for the best results. It is not necessary to alter the tap V, when once adjusted, unless there is extreme variation in the temperature; even then the engine would, it is claimed, work, although, of course, the results would not be so good as if the air supply were correct.

THE Hon. C. S. Rolls will, we understand, drive a Panhard car in the Paris-Madrid race.

NEW LOCOMOBILE STEAM CARS.

HEREWITH we illustrate two new types of steam cars recently introduced by the Locomobile Company of Great Britain, Limited. Fig. 1 shows the 10-h.p. four-seated dos-a-dos, which is notable by reason of the adoption of inclined wheel-steering and wood wheels, the latter being 28 inches diameter, shod with 3 inch pneumatic tyres. Steam is provided by a 16 in. boiler fitted with superheater. The engine, which

Fig. 1.—The Locomobile 10-h.p. Dos-a-Dos.

is entirely enclosed, is of the Whitney type, with cylinders 3 in. diameter by 4 in. stroke. Steam-operated air and water pumps are fitted, while special attention has been devoted to the lubrication of the engine. An extra large water tank is provided, this having a capacity of thirty-eight gallons. The car has a wheel base of 78 in., the track being 54 in. In Fig. 2 is given an illustration of the latest Loco-Surrey; this has a 16 in. boiler and a 2½ in. by 3½ in. engine. Both vehicles are

Fig. 2.—The 10-h.p. Loco-Surrey.

equipped with an improved differential gear, the shell of which forms two brake drums, one on either side of the sprocket wheel. Brake drums are also fixed to the hubs of each wheel. The two bands on the differential are simultaneously applied by one pedal and the two side brakes by another; both pairs are provided with compensating devices. The rear axle is carried on four rolling bearings, while the front axle is equipped with ball bearings.

At the annual meeting of the Hart Accumulator Company, Limited, Mr. G. W. Kidd, the chairman, said that after two years of experimenting they had secured a plate worthy of being put on the market for motor-car work. The Company is now fairly well engaged in this class of work.

THE SOURCES OF NOISE IN MOTOR VEHICLES.

(Concluded from page 12.)

THE noise due to the reciprocating parts is difficult of elimination in an explosion motor, subject as it is to constantly varying stresses. The slightest lost motion in the bearings of the connecting rod, either upon the crank pin or the gudgeon pin, is the source of a distressing knock whenever the piston changes from positive to negative work and the reverse. A fly-wheel which is not keyed to its shaft with absolute rigidity becomes, in operation, the source of nerve-racking thumps. These noises are immensely accentuated when the motor is doing full work at low speed, as the torque then becomes the large factor in the power produced. Insufficient flywheel capacity is also the cause at low speed, especially when hard work is called for. A motor, which cannot be throttled and sparked so as to run very slowly when the carriage is standing, is not likely to be noiseless in operation. No doubt, incorrect spark timing is a prolific cause of unnecessary noise, abnormally early ignition producing loud "thumps" and undue wear of the reciprocating parts. Some automatic device to time the spark is an essential requisite of the quiet running motor. A moderate speed petrol engine with properly closed valves, an intake silencer, with means to conveniently take up wear in all bearings, sufficient flywheel capacity and an automatic spark timer properly adjusted, ought to be a quiet running machine when at work, and, if it has a proper throttle, should prove a nearly noiseless one when standing.

Vehicles employing spur or bevel gear wheels for transmitting the power to the driving axle necessarily produce some noise therefrom. If all the gears be fully encased and operated in an oil bath the noise from this cause may be sufficiently minimized if the gear wheels are perfectly meshed and correctly cut. In case, however, that there is any defect in their alignment, the slightest looseness in their bearings or the least opportunity for spring in the material forming the supports of their bearings, the gears tend to push away from one another and are thrown out of correct pitch. The pure rolling friction between their teeth then becomes complicated with a sliding friction, the tooth outline is rapidly destroyed and the destructive action goes on increasing, with the production of a horrible grinding which is most offensive, especially to the trained ear. The operation of bevel gears involves a powerful thrust, tending to throw the two shafts out of a perfectly rectangular relation, and unless the bearings be extremely rigid and well-fitted, faulty mesh and excessive noise are the results. When gear-wheels are not enclosed it is practically impossible to maintain their lubrication, they become filled with grit and the correct tooth outline is soon lost, after which quiet operation is not to be expected. Gear-wheels having insufficient width of face or those which operate at undue peripheral speeds wear rapidly, and the inevitable accompaniment of this deterioration is a very unpleasant grinding noise.

The choice of materials for gear-wheels which mesh with one another is an important matter, and it is a generally accepted belief that pinions of unlike materials operate most quietly together. If the use of fibre or rawhide were permissible upon grounds of strength, much noise might be prevented. It ought to be possible to use such materials if sufficient width of face were allowed to compensate for the inferior strength of the material. In so far as gear-wheels can be dispensed with in the ordinary working of a motor-car, the noise of its operation may be lessened. Vehicles which have a direct transmission from the engine shaft to the axle, when operating upon the usual running speed, are to be commended as far as noiselessness is concerned. The clashing of the gear-wheels when a change of speed is being made in transmissions of the sliding pinion type may be entirely obviated if the gears are cut upon the proper system and not too fine a pitch chosen.

A chain drive ought to be nearly noiseless when new and in good condition, but as chains are hardly ever encased in present automobile practice, and as they are particularly vulnerable to grit and difficult of lubrication, they are subject to rapid wear. After the rivets have begun to wear and the tooth outline is deformed the chain stretches and no longer fits the sprockets. The block or roller ceases to fall into its place properly, but each block strikes its tooth and later snaps into its space. There are thus two separate noises for each link as it passes each sprocket—when it strikes the tooth and when it later snaps into place, and much noise is the result.

The rattle of the frame or running gear and its attachments is the least excusable of all the noises which an automobile is guilty of. A vehicle running upon pneumatic tyres should make no noise from this cause, but this is far from being the case. Distance rods are a prolific cause of rattle. They are generally attached to the frame and to the rear axle by plain studs or bolts of unhardened material passing through holes in the ends of the rods. Whenever the engine is propelling the vehicle the rod is under compression, but whenever the axle or wheel

THE AGRICULTURAL HALL.

HOW TO GET THERE.

THE Royal Agricultural Hall, Islington, where the great Automobile Show of 1903 will be held, is accessible from every part of the Metropolis by 'bus, tram, train and 'tube,' if the latter may be regarded as a means of locomotion apart from the ordinary railroad. Within easy reach of the City and the West End, it has proved a most popular centre of automobilism in the spring of the year.

Visitors from the provinces, too, will find the Agricultural Hall easily reachable, and the following handy ways of reaching the building should be remembered by distant friends arriving in London.

From Liverpool Street (G.E.R.)—By way of South Place to the Moorgate Street Station on the City and South London Electric Railway and thence to the Angel Station.

From Fenchurch Street (L.T. and S.R. and G.E.R.)—Go to Moorgate Street Station by way of Moorgate Street or Bishops-gate.

The Century 16-h.p. Brougham. (See issue of February 14th, page 969.)

brake is applied the distance rods are under tension, and in this way the bearings of the rods are alternately subjected to stresses which tend to develop looseness therein. The constant action of the rear springs, as the vehicle passes over rough roads, and the continual presence of grit, makes the wear very rapid, and as no adjustment is provided at these bearings they become very noisy when the vehicle travels over any but perfectly smooth roads.

Brake bands are generally loosely held when not in action, and the brake actuating mechanism contains a number of unadjustable joints which develop looseness and rattle after continued use. Steering gears which develop loose joints not capable of being taken up contribute to the noise, as do the creaking of spring leaves upon one another and the rattle of spring links when worn. A loose mud guard is also unpleasantly evident to the ear. A scrupulous attention to the details of bearing adjustability, and the lubrication and protection of moving parts will in the end give us a quiet running petrol car, and if the signs of the times be read aright it is none too early for the manufacturers to bestir themselves in this regard.

Cannon Street (S.E. and C.R.)—Three minutes' walk to the Bank Station on the C. and S.L.R.

London Bridge.—Proceed by the subway to the station of the C. and S.L.R.

King's Cross (G.N.) and St. Pancras (M.R.)—Go by 'bus to the Angel, Islington, or—three minutes' further along the Upper Street—direct to the Agricultural Hall.

Euston (L.N.W.R.)—Follow the route from King's Cross and St. Pancras Stations.

Waterloo (L. & S.W.R.)—The Hall can be reached by underground electric railways—all the way, first to the Bank, and thence by the subway adjoining, to the Angel station.

Marylebone (G.C.R.)—Train from Baker Street on the Metropolitan Railway to King's Cross, and then as directed above.

Paddington (G.W.R.)—Underground train from Praed Street, Bishop's Road, to King's Cross, and thence by tram.

The nearest point to the Hall on the City and South London Electric Railway is the Angel Station.

MOTOR-CYCLING NEWS.

FROM the Ormonde Motor Company we have received a copy of the catalogue of the "Kelecom" motors and "Ormonde" motor-cycles that they have just published. This is one of the most complete booklets of the kind so far issued, and comprises both a catalogue and a handbook, giving a full description of the various parts. Time was when it was most difficult to get illustrations of the "innards" of automobiles, but things have changed, and

The Ormonde Convertible Tandem Tricycle.

nowadays makers vie with each other in publishing the most complete handbook. Thus, in the Ormonde booklet we find not only illustrations showing general views of the company's motor, motor-bicycle, tandem, fore-carriage, and trailer, but sectional drawings of the engine, carburettor, silencer, contact breaker, valve lifter, etc., accompanied by terse but clear descriptions. Motor-cyclists generally will find much useful information in the Ormonde booklet and should procure a copy.

THE first motor-bicycle race in Spain was run off a few days ago on the road between Madrid and Guadalajara. The winner was Sr. Suaseac, who covered the 100 miles in 3 hours 14 minutes.

A MEETING is to be held in Edinburgh on the 13th to consider the advisability of forming a motor-cycling club for Edinburgh. The meeting will be held in the North British Station Hotel, and all motor-cyclists in the district are invited to attend.

THE opening run of the season of the Motor-Cycling Club on Saturday last was marred by the wretched state of the roads, due to the heavy rain of the morning. It is therefore not surprising that only twelve members left at the appointed time. Various little troubles were experienced *en route*, but eventually the whole party got into Brighton. At the Old Ship Hotel in the evening a dinner was held, at which no less than thirty-seven members and friends sat down. Mr. S. F. Edge, who occupied the chair, in the course of an interesting speech, generously offered a prize value £20 to the member of the Club who first makes an actual non-stop ride of 200 miles under proper supervision.

A COMPACT motor-cycle tyre repairing outfit has just been put on the market by Messrs. Wm. Guest and Son, of the Neptune Works, Sheffield. Looking through the sample outfit sent us, we find a tube of solution, a quantity of French chalk, spare valve tubing, a plentiful supply of prepared patches of different sizes, and pieces of canvas and prepared patching. New addi-

tions to repair outfits are found in a small piece of copying pencil and three sulphur tablets. The former will be found useful in marking the location, when discovered, of the puncture in the air tube, while the sulphur tablets are intended for removing the grey deposit on the tubes to enable the patch to properly attach itself in position. A small circular, giving some useful hints, completes an outfit which should find a place in all motor-cyclists' tool bags.

ON the last Saturday of the present month—the closing day of the Motor-Car Exhibition in London—the Ulster Centre of the Irish Motor-Bicycle Union will hold its first hill-climbing contest. Prizes are being presented by Messrs. W. M. Inglis and E. J. Shaw.

THE motor cycle race between Fournier and Barden, which was to have taken place on Saturday last at Canning Town, was postponed until the 12th inst., owing to the state of the track—the result of the rainy weather.

THE Motor Cycling Club is organising an Easter tour in the New Forest district, making Salisbury the headquarters. "Out-and-home" rides will be arranged from that centre.

A MEETING of members of the Motor-Cycle Trades Association was held on the 4th inst. at Anderton's Hotel, Fleet Street, E.C., when it was decided that the Association be registered as a company limited by guarantees of 5s. per member. The subscription is to be one guinea, free of entrance-fee. Mr. E. H. Arnott proposed, and Mr. Jackson seconded, that the Association should equally forward and protect the interests of all branches of the motor-cycle trade, whether directly or indirectly connected, one of the special objects of the Association being to mitigate the unnecessary trouble and expense consequent upon the number of exhibitions held every year in London. An amendment by Mr. Chandler, and seconded by Mr. Herbert Smith, proposed that the object of the Association be to regulate and control the interests of the motor-cycle trade by combination for the benefit of its members. This was carried by eight votes to five, and on being put as a substantive motion, was carried *nem. con.* The following were elected as members of the committee: Messrs. A. Brown, J. Dring, Garrard, Jackson, Belcher, J. Van Hooydonk, E. H. Arnott, A. Goodwin, D. Citroen, and Batson. Mr. S. J. Sewell was appointed secretary of the Association, subject to his consent being obtained.

IN the 1903 model Werner motor-bicycles the transmission is by a wide flat belt of specially selected and prepared leather, and in conjunction with which a special non-slipping pulley is

used. An illustration of the latter is given herewith. The pulley is made up of two flanges, which act as guides to the flat belt, and a number of compressed leather rings C, which fit upon the drum of the pulley. It will be noticed there are already three leather rings on the pulley B. When the full number of rings have been placed on the drum of the pulley, the plate A or flange is put on over the six threaded studs, and by means of nuts the rings are compressed between the flanges until a perfect grip is obtained.

HERE AND THERE.

J MR. WATSON, of yacht-building fame, is considering a design for a motor-lifeboat.

LORD CASTLEREAGH is one of the latest military accessions to the ranks of automobilists.

THE headquarters of the Volunteer Motor Corps are to be at Sanctuary Chambers, Westminster.

View of Motor of 1903 18-22-h.p. Mercedes Car.
(Allgemeine Automobil Zeitung.)

BRADFORD spends £2,000 in providing carriages and horses for the use of committees and officials. Why not experiment with motor-cars?

THE annual dinner of the Busy Bees Musical Society of Messrs. Hoare and Sons, the motorists' tailors, has just taken place under the chairmanship of Mr. Frederick Hoare.

THE Electric Ignition Company ask us to mention that they are only making the terminals illustrated in our last issue in conjunction with the E.I.C. sparking plugs, it not being intended to supply them separately.

THE defendant in a case of furious driving heard at Kingston admitted going eighteen miles an hour at Surbiton, but pleaded in extenuation that he had driven the Archbishop of Canterbury, in Whitehall, at a greater speed without being stopped.

MESSRS. JOSEPH LUCAS, LIMITED, have sent us copies of their 1903 catalogue of "Motoralities," which include lamps, pumps, valves, tyre repair outfits, jacks, horns, and a variety of other useful accessories for motorists. A small separate pamphlet deals with the Wells-Lucas lubricating oils, for which Messrs. Lucas are sole agents.

QUITE a bundle of leaflets describing their specialities has reached us from the Automobile Components, Limited, the agents in this country for the Societe de Constructions Mecaniques de la Loire. One list deals with the "Automotor" petrol engines, which are made in sizes from 2½-h.p. single cylinder up to 100-h.p. four-cylinder. Another deals with the Automotor set of fittings for building motor-bicycles, two styles being shown. The third list deals very completely with the light car set; this should prove of interest to small motor-car agents up and down the country, as it enables them to turn out an attractive little two-seated car with 4-h.p. engine to sell at the popular price of £110. List AA is a general one and gives particulars and illustrations of the 4-h.p. voiturette, a 4-h.p. motor-tricycle, and the Automotor 10-h.p. two-cylinder car, the latter being one of the company's latest productions.

THE duty on motor cars and cycles imported into British India is at the rate of 5 per cent. *ad valorem*.

MR. SAMSON PARSONS has opened a garage for electrical vehicles near the Bank Top station, Darlington. It is equipped with apparatus for the re-charging of batteries.

ON Thursday Mr. Rowland Winn read a paper on "Various Types of Transmission as Used on Motor-cars," at the headquarters of the Yorkshire Automobile Club at Leeds.

THE Woodstock Motor Mart and Repository have opened a garage at 56, Broad Street, Birmingham. Adjoining it is a large workshop well equipped with tools for carrying out all classes of repair work.

THE Locomobile Company of Great Britain have sent an invitation to the American team competing for the Gordon Bennett Cup to make their depot in Sussex Place, South Kensington, their headquarters while in London.

A CAPITAL catalogue of the Clyde motor-bicycles comes from the Clyde Cycle and Motor-Car Company, Limited, of Leicester. A general description of the various parts of the machine is one of the features that should prove of interest to novices.

AT the garage of the Firefly Motor Company, High Street Croydon, an auction sale of about forty motor-cars and motor-cycles is being held to-day (Saturday). This is the first of a series of sales to be held every two months during the season.

THE Dechamps Motor Company, Ltd., has been registered with a capital of £1,500 to acquire from the Graphic Motor and Engineering Company, Ltd., the business, goodwill, and the right to use the name Dechamps in connection with motors, motor-cars, etc.

AMONG the witnesses in the Cavendish settlement case have been Mr. Frederick Frenzels, who deposed to going to the Strutt's house at Maidenhead on a motor-car and making the acquaintance of Mr. Cavendish; and Mr. A. F. Collins, who testified as to purchase of a motor-car by the plaintiff.

MR. GEO. LINNELL, of Market Deeping, and a member of the Lincolnshire Automobile Club, has sent us a photo, reproduced herewith, showing the simple and handy luggage-carrier he has

Mr. and Mrs. Geo. Linnell on their 6-h.p. Marshall Dogcart.

devised and applied to his 6-h.p. Marshall dog-cart. The carrier, which can be put on in two minutes, folds up neatly so as to be out of the way when not in use.

MOTOR-CARS were a feature of the election at Woolwich on Wednesday, and will prove equally useful in the bye-election for the Rye Division of Sussex. Amongst the Parliamentarians lending automobile aid are Lord Brassey, Sir George Newnes, Mr. C. D. Rose, M.P., and Mr. R. L. Harmsworth, M.P.

THE Swiss Automobile Club is organising an international race from Neuchâtel to Corcelles-la-Tourne for the 5th July next.

MR. FREDERICK LITCHFIELD, of the Sinclair Galleries, Shaftesbury Avenue, W., has disposed of his lease to a firm of motor-car manufacturers.

CAPTAIN J. A. COLE, J.P., has been elected chairman of the Lincolnshire Automobile Club, and Captain Boothley and Mr. Parsons Wright have been added to the committee.

MESSRS. LAKE AND ELLIOT, of Braintree, Essex, have just issued a new catalogue describing brazing lamps, rim punchers, motor jacks, together with many other new tools suitable for motor-car and cycle repairers.

THE Automobile Components, Limited, have this week supplied to the North-Eastern Railway Company an "Automotor" 100-h.p. four-cylinder petrol motor, of which an illustration is given herewith. It is the last of an order for six engines, five of which were delivered some time ago, and are doing satisfactory work. The dimensions of the motor are as under:—Height 4 feet, length 4 ft. 10 in., depth 1 ft. 11 in. Bore of cylinders, 100 millimetres, and length of stroke 260 millimetres. The mixture is supplied by a special Longuemare carburettor. The speed of the motor ranges from 200 to 600 revolutions per minute. At 350 revolutions 100-h.p. is developed, while at 600 revolutions the engine is said to give off nearly 200 brake h.p.

MR. H. F. FRIEDERICH, the chief engineer of the Corporation Electricity Works, West Hartlepool, writes that they have excellent facilities for the charging of the batteries of electrical vehicles, the charge during the day being 3d., and at night 5d. per unit.

MR. HENRY F. JOEL has purchased the lease, plant and stock of the branch at 31, Wilson Street, London, E.C., from the firm of Messrs. Henry F. Joel and Co. and Thomas Potter and Sons, United, Limited. He purposes carrying on business as a dynamo, motor, and electric motor-car manufacturer and contractor at that address in his own name.

MESSRS. J. COCKSHOOT AND CO., LIMITED, have sent us copies of catalogues of the Stanley steam car and the Northern petrol automobiles. The latter is neatly got up and gives illustrations of the complete vehicle in several different positions. Both the Stanley and the Northern cars have already been described in the *Journal*.

FINE new premises are being opened by the Highgate Motor Company, of which Mr. J. Keele is manager, at 23, Grand Parade, Archway Road, Highgate. These are in addition to the present place in the Archway Road, and also a garage in the vicinity, where is storage room for from eighty to 100 cars. The Highgate Motor Company is making a special feature of Darracq cars.

THE Leicester Corporation have ordered a combined motor-fire tender and chemical fire engine from Mr. C. T. Crowden.

MR. H. WHITE, the first secretary to the American Embassy in London, is now among the motorists, having just ordered a 22-h.p. Daimler car.

THE electrical engineering department of the Speedwell Motor and Engineering Company, Limited, has been disposed of to Mr. A. E. Felgate, of Reading.

THE Locomobile Company of Great Britain, which, as already announced, is introducing the Waverley electrical cars, are arranging to equip a portion of their extensive premises at South Kensington as a charging station.

A FRENCH engineer has introduced a new idea with regard to the upkeep of motor-cars which is worth recording. For a monthly charge of £5 he undertakes to visit his clients once a week to keep their cars *au point*, this work to include the grinding of the valves, setting the ignition in order, overhauling the carburettor and the water circulation, adjusting the chains, bearings and change-gear, attending to the lubrication of the various parts, etc., but not the washing of the car. Special charges are of course made for any repairs or new parts that may be necessary.

THERE was a large increase last year in the value of the motor-cars and parts exported from Belgium, the returns just issued showing a total of £58,596 as compared with £39,800 in 1901. The exports of motor-cycles and parts also underwent a large advance, attaining a total of £16,744 as contrasted with only £14,608 in the preceding twelve months.

MR. SOMERSET PLAYNE, of the Wycliff Motor-Car and Cycle Depot, Durban, recently made the first motor-car trip between that city and Maritzburg, a distance of about seventy-three miles. The road, with the exception of about five miles, is free from sand,

but the whole surface from Botha's Hill to within a few miles of Maritzburg is one mass of boulders and sluits, many of the latter being almost impassable. Mr. Playne, whose car is a 4½-h.p. Stirling, has come to the conclusion that, until the main road has been considerably overhauled and repaired, motorists would do well to give it a wide berth.

THE Standard Motor Company, Ltd., has been registered with a capital of £5,000 to carry on the business of manufacturers of and dealers in motors, motor-vehicles, etc. The first directors are Messrs. R. W. Maudslay and G. A. Maudslay, and the registered office is at 37, Earl Street, Coventry.

MR. LOUIS SINCLAIR, M.P., entered a meeting at Stratford the other day, having rushed down from the House of Commons on a motor-car. He had successfully eluded the members both of the Metropolitan and City constabulary, and he hoped the audience would wish him an equally successful return journey.

The "Automotor" 100-h.p. Petrol Motor.

CORRESPONDENCE.

MOTOR-CARS IN THE HUNTING FIELD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see in your last issue a photograph illustrating the use of motor-cars in connection with stag hunting. I may say that I had charge of a car during August, September and October of last year at a shooting lodge eighteen miles from Inverness. The vehicle was used a great deal for that particular class of work, mostly for conveying the heads into Inver-

ness to be mounted for ornamental purposes; the beasts often weighing 16 to 19 stones. I enclose you a photograph of one of the heads, the points of which reached from corner to corner of the tonneau; also a photograph of the car in its Highland home; the vehicle, which is an 8-h.p. De Dion, ran perfectly for the whole time with one exception, when a part of the water circulating pump wore out.—Yours faithfully,

ALFRED W. WASTNAGE.

CHAINS AND LIVE AXLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have just been reading your report of Mr. Sennett's recent paper to the members of the Automobile Club, and am somewhat surprised at his sweeping condemnation of chains. It would be interesting to hear the opinions on the subject of Messrs. Renold, Brampton, and Hill, our leading motor chain manufacturers, not to mention those of the builders of automobiles, who rightly, in my opinion, still adhere to side chains in preference to transmitting the power direct through a cardan shaft and bevel gear to a live axle. It cannot, of course, be denied that the adoption of live axles has made considerable progress, but at the same time it is hardly to be imagined that the Daimler and Wolseley Companies at home, and the Cannstatt-Daimler, Panhard, Mors, De Dietrich, and Rochet-Schneider concerns—to cite a few examples—on the Continent, still adhere to chain driving, without having fully weighed the *pros* and *cons* of the live axle.

Chains certainly are troublesome at times, but 90 per cent. of these troubles are due to want of attention on the part of the user, for it has yet to be properly recognised by many motorists that the efficient cleaning and lubrication of chains are just as important as any other part of the mechanism of motor-cars. Neglected chains may break or mount the sprockets, but by carrying spare links, or even a spare chain, the damage can easily be repaired on the roadside. I pity the poor motorist, however, who, when miles from anywhere, strips his bevel gear, a by no means unusual occurrence, as a visit to any motor repairer's establishment will prove. In mechanical engineering I believe that bevel gear is only adopted as a last resort, and I am one of those who consider bevel gear in motor-cars is but a temporary makeshift, and that it will ultimately be abandoned altogether. This is, however, another story; and I will conclude by venturing the opinion that the time when chains will be cast off permanently is not so near as Mr. Sennett would have us believe.—Yours truly,

JACK-IN-THE-BOX.

THE MOTOR-CYCLE AS A GUIDE TO CAR DRIVING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Motor-cycling is such a fascinating amusement, the wonder is so limited a number of the upper classes have as yet mastered an art as agreeable in practice as it is simple in acquirement. In olden days, when his "mount" broke down with the utmost regularity, the motorcyclist required to be born half an engineer and half an acrobat to assure his own stability and that of his machine. Fortunately, in this

new century, our manufacturers have given us greatly improved designs. Evolution at a rapid rate is remodelling everything in this best of all possible worlds. Ardent enthusiasts can ride from Cornwall to Caithness with little mechanical knowledge. Interchangeable box spanners, fitting every nut, a file, a pair of pliers, and a screwdriver meet all roadside requirements. Puncture troubles are becoming bugbears of the past, magneto ignition takes care of itself, while portable jacks, when the evening destination is attained, make cleaning a positive pleasure, and are invaluable next morning when testing the machine before starting.

If Englishmen intend to hold their own in the world's progress, they must become skilled in the best means of locomotion. All we ask of men of sense, whose trade, occupation, or it may be inclination, carry them away from home, is that they should give the motor-cycle a patient trial. In half an hour of honest endeavour they will have overcome most of the difficulties of early progression. The world is already converted to the motor-car; how much more difficult is that complicated conveyance to understand than the sweet simplicity of the merry motor-cycle. Clutch driving, associated with discordant notes which too frequently arise when a speed-change is misjudged, cannot be acquired at a moment's notice. As a car owner of more than four years' standing, the writer recommends all would-be automobilists to commence their career as motor-cycle riders. In due course, when the automobile arrives (English-made throughout) and is installed within the coach-house precincts, you will be familiar beforehand with most of its mechanism, and have considerable knowledge of its working capacities.—Yours truly,

EDWARD KENWARD.

THE GORDON BENNETT RACE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice that Mr. S. F. Edge has placed himself and his car at the disposal of the Automobile Club to go over the Gordon Bennett course and advise the Club on the subject. Whilst everyone must recognise Mr. Edge's public spirit, I fear it has not occurred to either that gentleman or the Races Committee of the Club that if he is going to take part in the race his frequent trials of the course may give rise in the minds of some competitors to the idea that thereby he might obtain unfair advantage over his foreign rivals.—Yours truly,

SPECTATOR.

THE SPARKING PLUG "DISCOVERY."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have noticed several remarks about the spark gap and fire, so thought I would see if I could fire petrol with it. I saturated a rag and placed it over the open spark, moved it about in all directions, but could not get it to fire. There is one thing I have noticed in connection with the spark gap: you cannot run your accumulators so low; this I think rather an advantage, as the accumulators cannot be run down, and by removing the gap a considerable amount of current can be obtained, perhaps enough to get you home. I certainly think the gap a great advantage.—Yours truly,

E. ESTCOURT.

AGScott Motor-Stable (see Mr. Wastnage's letter above.)

"H. A." asks for the best way of treating leaky valves.

"LITIOUS" writes:—"Has the A.C.G.B.I. given up the idea of holding club runs? The Sheffield, Nottingham, Oxford, and Yorkshire Clubs have already held their first turn-out of the 1903 season."

A LETTER awaits Dr. R. N. Pickering, who inquired recently with regard to the clutch in a De Dion car. It will be forwarded on receipt of his address, which has been mislaid.

MR. J. E. HUTTON writes:—"With reference to Dr. Arthur Fenning's letter in your last issue, pointing out the danger of the exterior sparking gap, I should like to say that all danger can be eliminated by using a sparking plug which is unaffected by sooty deposit, therefore requiring no external aid. The new Pognon sparking plug answers these requirements exactly, and although I have used them on cars immediately out of the works for testing purposes, where ordinary plugs invariably break down in the first half-hour, I have not had to take a single Pognon plug out."

MR. F. WELLINGTON writes:—I notice in your issue of the 28th ult. particulars of a small valveless motor which was shown at the last Paris Salon, made by an engineer named Gevey. It may be interesting to your readers to know that I made the same kind of motor in 1897 for a motor-bicycle; the engine is still in stock, and can be shown to you any time you like. Although I do not desire to claim the idea as my own, as it was used some time before 1897 for a gas engine, you will see it is by no means a new invention.

We shall be glad to have the address of Mr. Thomas Browning, the Kentish motorist who won a case in the law courts recently.

DEVELOPMENTS IN THE AUTOMOBILE:

(Concluded from page 17).

MAKERS have not given the pigmy electric installation entailed anything like adequate attention. In the first place the switches, the commutators, the contacts, the binding screw arrangements are too often of the commonest description, and the roughest workmanship, bringing about many *contre-temps* quite avoidable. Makers, moreover, seem to think that in no matter how slipshod a fashion the wiring is carried out, it will be equally efficacious. That no radical changes have been carried out upon the motor by no means proves that they ought not to have been, nor that considerable modification may not be observable in the immediate future. At first it was thought that the problem of production of an equilibrium motor, that is to say, one in which the explosions should be equally and oppositely equilibrated, merited very serious study. An equilibrium motor is such, in fact, only when it is working in a correctly normal and perfect manner; but if anything on the one side—be it but a trifling derangement of a valve—be abnormal, then the equilibrium immediately disappears. Such motors require a very heavy fly-wheel, seeing that the explosions only take place half the number per unit of time, and are intrinsically twice as violent. It is obvious that the whole of the transmission is subjected to much more serious torsional strains, and has in consequence to be made both stronger and heavier. The equilibration also holds good for certain speeds, and there appear to be "critical" speed at which it is most violent. Moreover, it almost invariably entails additional complication by reason of the necessity for supplementary gear. The last consideration tells in favour of multiple cylinders; the thing to be aimed at obviously is to impart to the propelling shaft the greatest possible number of impulses per unit of time, and these of the least possible violence for a given horsepower. Multiplication of the cylinders reduces their diameter, ensures ease in starting, and paves the way for more efficient silencing. From these points of view much might be expected from the eight-cylinder motors about to be tried upon the Continent. From the point of view of actual power obtained, however, I think it quite possible that these may not come up to expectation, because we must not lose sight of the fact that even a four-throw crank is an undesirable thing, and when you come to have a long line of eight cranks, loss of power due to torsional stress and twist is likely to arise. The multiple cylinder effect, however, is so desirable that I am sure we ought to be thankful to the house of Charron for having the enterprise to make the *essai*. A still more efficient arrangement would, doubtless, be the employment of four double-acting cylinders; the double-acting cylinder problem is a nut not yet cracked by evolution. Nothing can be more unscientific than the present system of mounting vertical cylinder motors upon the suspension springs of pleasure carriages, and, although they were placed there by the exigencies of rapid inspection and road repair, their *emplacement* does not represent a phase of evolution of a lasting nature.

The thing to consider is what is it we ought really to strive for? It is to produce an internal combustion motor giving off its power by means of impulses analogous to those of the steam engine. In other words, an internal combustion engine *per se* as opposed to an explosion engine. That is the first thing. Then the second thing is so to bring this internal combustion under control that we may increase or diminish the length of time during which it shall act for each stroke—in other words, to control the power of our motor by the length of combustion and subsequent expansion of the gases within the cylinder in a manner very analogous to the automatic varying cut-off of a good steam engine. Nothing can be more unscientific than the present system of mixing the fuel with its oxygen before admission to the motor, nor the derivation of its power by means of combustion so rapid that it may well be termed an explosion. What is wanted in place of it is a means of sustaining that combustion and of passing fuel into the cylinders in exact accordance with the power required *pro tem*. By this means we should obtain a motor embodying that valuable attribute of the steam engine often spoken of as the "great elasticity" of its power. A motor, moreover, of far greater efficiency, both theoretical and practical, and of extraordinary simplicity, even when compared with our old and

trusted servant the steam engine, if we take, as we must take, the engine and boiler together. Such a motor would at the same time solve the change-speed problem, its range of power would quite equal the steam engine, for from the same motor we should have moderate power with very great efficiency, and great power—when required—with moderate efficiency.

With regard to the immediate future, one would expect to see improvements in the direction of running motors with hotter cylinders—which the introduction of thin steel cylinders will enable to be done—a greater degree of expansion, enabling silencing to be more effectively dealt with; the use of higher initial compression enabling automatic ignition to be made use of, and with it a great advance in simplicity.

THE OWNERSHIP OF A MOTOR-CAR.

ERNEST JARDINE, motor and cycle manufacturer, of Nottingham, has brought an action at the Nottingham Assizes, against Arthur Collins, motor repairer, of 128, Manvers Street, Nottingham, to recover possession of a motor-car.

Mr. Stevenson said plaintiff lent out a car on the hire purchase system to Mr. Allen, who was to pay a sum of £314 by instalments, and the motor was to remain the property of Mr. Jardine until the instalments had been completed. Mr. Allen paid a sum of £50, and further sums by instalments. Ultimately, however, he made default in payments, and Mr. Jardine was entitled to have his motor back again. The car needed repair, and was sent to the defendant, who did the necessary work. The car was sent back to Mr. Allen with a bill for £16 3s. 5d., who disputed payment, as he thought the charge was too much. After using the car for some time he then sent it back to Mr. Jardine for repair. Mr. Jardine, having repaired the car, rather demurred at letting Allen have it again, but ultimately he did so. Allen had in his service as driver a man named Collins, who did repairs. On November 22nd Allen discharged Collins (who was a brother of the Collins who had previously repaired the motor), and on the morning of December 2nd the latter went to Allen's premises, fetched the car, and took it to his brother. The defendant refused to let the car go out of his possession until he was paid the £16 3s. 5d. owed him by Allen. When Mr. Jardine asked for the car he set up the same claim against him. Twenty pounds had been paid into court in order to regain possession of the car subject to jurisdiction. After hearing counsel for the defendant, the learned Judge said there seemed to be no case for the defence to go to a jury, and entered judgment for plaintiff with costs.

MOTOR-CAR LITIGATION.

In the Chancery Division Mr. Justice Farwell has heard the case of Hodgson v. the Speedwell Motor and Engineering Company, Ltd., which was a motion by the defendants to strike out the statement of claim on the ground that it disclosed no cause of action. His Lordship found there was a case to be reasonably argued, and he refused the motion, with costs.

FURIOUS DRIVING CASES.

COURT.	DEFENDANT.	ALLEGED SPEED.	RESULT.
Bristol	*G. Smith, Bristol	20 m. p. h.	20s., etc.
Kingston	C. Swinton, Victoria St., S.W.	—	£5, etc.
"	A. Goodwin, Chiswick	20 m. p. h.	£5.
Epsom	T. Hersey, Epsom	—	£1, etc.
Winchester ...	W. S. Weller, Norwood	24 m. p. h.	£5, etc.
"	R. Hargraves, Reading	25 m. p. h.	£10, etc.
South Shields	*E. Wilkinson, South Shields	—	10s., etc.
Accrington ...	F. Karno	—	£5, etc.

Where no alleged speed is given it is understood to be above the legal limit.

MARCH 21ST TO 28TH, 1903.

PLAN OF GALLERY.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, MARCH 21, 1903.

[No. 211.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

stretch between Athy and Old Kilcullen will have the opportunity of seeing each car pass twice in each circuit, so that with a dozen cars competing there should be ninety-six opportunities of seeing a racing vehicle. And such a succession of incidents will give ample excitement during the eight hours that the race will be in progress.

Competitors' Colours.

England, emerald green; Germany, white; America, red; and France, blue. It is easy to see that the selection of green is a compliment to Ireland, while the adoption of red, white, and blue by the other three competitors should be of good omen for another British triumph.

The Lords Agree.

IN the House of Lords, on Monday, the Marquis of Londonderry moved the second reading of the Light Locomotives (Ireland) Bill, which has already passed through the House of Commons. He explained that the measure was intended to permit of the Gordon Bennett Automobile Race taking place in Ireland. The Bill, if passed, would be of enormous benefit to Ireland, as the race would attract people from many parts of the world. Earl Spencer supported the measure, remarking that it was a new sensation to have a Bill on which all parties in both Houses were agreed. The Bill was then read a second time, so that only formal matters have now to be complied with to secure the legalising of the forthcoming race.

The Irish Automobile Fortnight.

ON the assumption that the race for the Gordon Bennett Cup will be run on Thursday, July 2nd, the suggested programme is as follows:—July 1st: Exhibition of the Competing Cars at Earlsfort Rink, Dublin. 2nd: The Gordon Bennett Race. 3rd: Gymkhana at the Phoenix Park, Dublin. 4th: Speed Trials in the Phoenix Park, Dublin. 6th: Tour to Newcastle and Belfast. 7th: Four-mile Time Test at Newcastle; Hill-climbing Trial for the Henry Edmunds Trophy. 8th: Return to Dublin. 9th: Start for

Cork (156 miles). 10th: Arrival at Cork; Eliminating Race for Motor-boats at Queenstown, in the morning; Speed or Hill-climbing Trial at Cork in the afternoon. 11th: Motor-boat Race for the Alfred Harmsworth Cup at Queenstown. 13th: Start of tour through the South. 14th: Arrival at Killarney. July 15th: Hill-climbing Trial on the Killorglin-Tralee Road for the County of Kerry Cup, and termination of the official tour.

The Exhibition.

TO-DAY (Saturday) the great Motor-Car Exhibition opens at the Agricultural Hall, London, and scarcely a motorist within a reasonable radius of the Metropolis will omit taking a trip to Islington on one of the days of next week. From a distance, too, will come many enthusiasts, while the new interest given to automobilism in Ireland will result in a strong contingent of visitors from the Emerald Isle. Several Continental leaders of automobilism have expressed their intention of being present, and doubtless a good many designers of world-wide reputation will take the opportunity of seeing what English firms are doing.

The Club Day.

AS generally known, the Exhibit will be open from 10 a.m. to 10 p.m., the admission being oneshilling, except on Wednesday, the 25th, when, as was the case last year, the charge for entry will be half a crown. Many Society leaders and members of both Houses of Parliament will be present on that day, and everything bids fair for an advance on last year's success.

Early Preparations.

DURING the last few days the quiet little Barford Street, Islington, has been a scene of animation, and the preparations for the great Show opened to-day at the Agricultural Hall, have kept the neighbourhood lively and busy. One characteristic feature of the Agricultural Hall Shows has always been the celerity with which stands have been occupied, and only a very few minor touches will be required on a few of the displays during the early hours of Saturday. Some idea of the extent of the Exhibition may be obtained from the fact that all the electric current obtainable from the plant at the Hall and also at the generating station of the Borough Council has been booked, and additional engines and dynamos have had to be fixed to meet the demands of exhibitors. This is the first time in the history of the Hall that such an event has occurred, and it is a testimony to the energy with which the trade has interested itself in the great Show that this extra expense has been rendered necessary.

Some Features.

AMONG the vehicles shown, public curiosity is being excited by the presence of the Hon. C. S. Rolls' racing car which recently established a record at Welbeck, while the interest of the trade has been whetted by the announcement that the Star car which is to take part in the eliminating contest in connection with the Gordon Bennett race, will be on

view. The fact that this is the first of the vehicles entered for the International event to be shown in public, lends additional interest to the stand whereon it is shown.

The Scottish Club.

THE annual general meeting of the Western Section of the Scottish Automobile Club was held in Glasgow on the 11th inst., Mr. John Adam, Chairman of Section, presiding. The annual reports and accounts were unanimously adopted, and the membership of the Section, exclusive of honorary vice-presidents of the Club territorially attached to the Section, reported at 127. The Lord Provost of Glasgow was re-elected Honorary President of the Section. Messrs. H. M. Napier, W. H. Kingsbury, and James Burns, with the Chairman and Secretary *ex officio*, were elected representatives to the General Council of the S.A.C. Messrs. James R. Nisbet and Thomas Syminton were elected representatives to the Council of the A.C.G.B.I., and Messrs. James R. Nisbet and Robert J. Smith appointed to the Council of the Motor Union. On the motion of Professor Galt the Committee and office-bearers were cordially thanked for their services during the past year. At a meeting of the reconstituted Committee, held after the annual meeting, Mr. John Adam was re-elected Chairman and Mr. R. J. Smith, 59, St. Vincent Street, Glasgow, Secretary of the Section.

Mr. J. W. Courtis, the Winner of the South African Small Car Pursuit Race, on his 6-h.p. Baby Peugeot.

London Traffic.

ACCORDING to Colonel Yorke, the Chief Inspector of Railways to the Board of Trade, the American city of Boston can claim the premier position in regard to the handling of street traffic. He rightly points to the heavy van traffic as causing the congestion found in Metropolitan thoroughfares. There are no alternative routes by which to separate the slow and fast vehicles, but the introduction of automobiles would make traffic fast and lessen it also. They occupy small space, and are easily steered when not bigger than a 'bus. Colonel Yorke thus emphasizes the value of the motor-car, and has established the right of its advocates to be heard by the Royal Commission now sitting to inquire into the conditions of London traffic.

Automobile Education.

Few cathedral cities have shown the interest in automobilism that has been evidenced at Exeter, where the local Chamber of Commerce has been making special inquiries into the details of the industry. Sir Edgar Vincent, M.P., presided at the annual meeting of the Chamber the other day, and said one interesting feature of the year's work was the action which had been taken locally regarding the possibility of starting new industries. Attention was devoted to establishing a motor

car factory in the city. For his own part, although the result of the inquiry which was made led to no immediate practical result, he believed the subject deserved to be kept constantly before their minds. He was absolutely convinced that the motor industry had come to stay, and that within the next ten or twenty years a very large portion of the horse-drawn traffic would be superseded by mechanical traffic. Outside the question of construction, there was another field where the new industry offered considerable opportunities for energetic men. He alluded to the opening which there undoubtedly was at the present time for mechanically trained men to drive cars. He did not know what was the precise rate of wage gained in Exeter, but a driver of a motor-car of moderate accomplishments and knowledge could count upon £2 a week, and a good many up to £3 and £4. That was an opening for bright lads who wanted to make their way in the world, and he suggested, in connection with a commercial scheme of education, that it should examine whether it was not possible to turn out from Exeter a certain number of those candidates.

Motor-Car Imports and Exports.

ALTHOUGH the large totals recorded in January last have not been maintained, the returns now available relating to the British imports and exports of motor-cars and cycles during February last show an increase, as compared with the same month of last year, both as regards the imports and exports. To deal first with the imports, no less than 300 cars and cycles were imported into this country last month, the value of the same being returned at £82,542. The value of the "parts thereof" is given as £12,193, so that we get a combined total of £94,735, as compared with £167,112 in January last and £52,682 (representing 213 cars) in February, 1902. Some of the imports were only of a temporary character, being re-shipped to foreign destinations. Thus last month the re-shipments comprised twelve vehicles, amounting in value to £5,937, and £717 of parts, bringing down the net imports in February to £88,081, as against only £48,564 in the same month a year ago. As regards the exports of automobiles of home manufacture, the shipments during the past month amounted to fifty-three vehicles of a value of £24,205. Of parts, the exports attained a value of £2,024, making a combined total for February of £26,229, as compared with £16,876 in January last, and £6,569 (representing twenty vehicles) in February, 1902.

Motor-Cars at the Delhi Durbar.

ONE of the first serious attempts to introduce motor-cars to the Indian public may be said to have been embodied in the "Motor-Car Depot" established by Messrs. Turner, Hoare and Company, of Bombay, at the Delhi Durbar. Judging from the thousands of people who visited the temporary structure in which the display was made, the advent of the automobile into India caused an immense amount of curiosity, if not interest. The great question which seems to be exercising the mind of the would-be motorist in India is, what should be his source of power? Is the car to be propelled by steam, electricity, or oil? And if the latter, is it to be petroleum or petroleum spirit? In the exhibition at Delhi, above referred to, electric cars were absent, but steam and petrol cars were shown, the latter predominating. There were, moreover, a number of "Locomobiles" to be seen, all of which appeared most satisfactory, and we understand that these were introduced by Messrs. Shaw, Wallace and Company, of Calcutta. For use in India they are fitted with kerosene burners. The Maharajah of Rewa has a Gardner-Serpollet steam car; H.H. the Maharajah of Ajodhya has also selected a steam car; the latter is of English construction and is fitted with a "Lifu" burner. The chief difficulty in the case of petrol cars appears to be the importation and transport of the necessary spirit to work them. The Indian Petroleum Act was obviously drafted at a time when motor-cars in their modern development were not thought of, but even this is no excuse for designating every

inflammable liquid as "Dangerous." Unfortunately, the Government have even gone further than this, and in dealing with the transport of petrol or naphtha over railways, they classify it as an explosive. It is surely time that these rules should be entirely revised. With careful but reasonable restrictions, the importation, transport, and storage of petroleum spirit could be regulated as easily as paraffin. The assertions which are made as to the impossibility of the use of petroleum spirit in India owing to the heat are, remarks the "Indian and Eastern Engineer," based on simple ignorance. "Petroleum spirit is used in countries as hot as India, and it is actually produced both in Assam and Burma. We know of some launches which have been running in this country for some years on petroleum spirit, where the temperature frequently exceeds 100 degrees in the shade, and there has been no difficulty of any kind."

The Eastern Highways.

WHAT a pity the means of access to the beautiful sylvan glades of Epping Forest are so abominable—the only adequate word—from whatever part of the City or West End they are approached. Going towards Woodford by either the Forest Gate or Leytonstone routes, the old Mile End Road with its frightful paving and congested traffic has to be passed, while the more northern highway, the Lea Bridge Road, is equally distressing to motorists. This road turns off at right angles from the Lower Clapton Road, and is the main artery to Walthamstow, Leyton, and Epping Forest, and thence further into Essex. A single line of indifferently kept tramlines passes up its centre. The macadam strips by the side of the tramway track are always in a very bad condition. It is a road that ought to be widened ere both sides are built upon, and those motorists who are interested in the suggestions of Mr. Jeffreys, at the Automobile Club, last week, might well urge such a course upon the local authorities ere it is too late—or, rather, too expensive.

Motor Buses on the Coast.

At the last meeting of the Hove Town Council, Alderman Bulmer pointed out that the local omnibus company was licensed to run motor-omnibuses, but had not yet done so. He asked if they did not put them on the road by June would the Town Council license anyone else to do so, to which several members replied with a vigorous "Yes." In closing the discussion, Councillor Leeney said the omnibus company had had sanction to run motor-omnibuses for some time past, and he thought the reason why none had been put on the roads was very well known; it was the impossibility of getting a reliable motor-bus to carry anything like a fair number of passengers at a reasonable price. But, all the same, he certainly hoped they would soon see their way to provide something of the kind, in which they may be materially assisted by offers of help from manufacturers.

Oil as a Fuel.

PROFESSOR VIVIAN B. LEWES has just delivered a lecture on this subject at the Petroleum Institute, the Principal (Dr. P. Dvorkovitz) presiding. The Professor pointed out that many of the uses, and most of the dangers, of mineral oil are due to the more volatile portions, which, having a flash point below 73 deg. Fahr., are ineligible for use as ordinary lamp oils; but, owing to their extreme volatility, are specially adapted for generating combustible vapours, which, in admixture with a due proportion of air, give highly explosive mixtures, which are now utilised in many forms of motor, and which also have given rise to highly disastrous results when accidentally formed and ignited. Professor Lewes also referred to the devices for utilising mixtures of petroleum spirit and air in place of coal gas and air; but the danger and many accidents that arose from the use of petroleum spirit led to attempts being made to utilise ordinary paraffins of high flash point.

Agriculturists and Motor-cars.

MR. RIDER HAGGARD's references to motor-cars at the meeting of the Associated Chambers of Commerce, mentioned recently, do not seem to have wholly carried conviction to the minds of his hearers. His idea was that as much as 100 lbs. could be carried by the agricultural post, but they could not expect parcels to be posted and delivered under the same conditions as a letter posted at, say Wick, for Land's End. It should be a branch of their ordinary postal service, and he contended that as much as 100 lbs. should be carried. The goods should be collected by means of motor-cars once or twice a week, and the whole thing should be combined with a system of "pay on delivery." Mr. Jasper Moore, M.P., suggested that Mr. Rider Haggard should form a company, and experiment as to whether the running of motor-cars on the lines he had proposed would have beneficial results. In reply Mr. Haggard said he had neither the means nor tastes to allow him to fall in with the suggestion as to forming a company. Although we do not expect much practical good will result, the discussion of the subject will prove useful in popularising the automobile among the agricultural community.

A Heavy Load on one of the Societe Nanceennes Petrol Lorries.

White v. Black.

ARE the spirits entering the motor business? This is a question suggested by a letter received by the Motor Manufacturing Company, Limited, bearing the Fulham postmark, as follows:—"At the request of your guides we write to ask you not to use or make black goods but those of curative colours. Black came into the world through evil agency, and is against God's divine laws; your guides earnestly pray that you will help us in this important matter.—Yours faithfully, Snowdrop." Probably Snowdrop has been consulting a planchette, and had she—or is it "he"—given her real name and address other manufacturers might have applied for hints as to the future. When will the speed limit be removed and who will win the Gordon Bennett race are two questions upon which information would be welcomed—prior to both events. Can "Snowdrop" oblige?

A Ballot.

"THOSE who attended the meeting of the Society of Motor Manufacturers on Monday at the Hotel Cecil," write the Duryea Company, "spent a very diverting, though certainly not an instructive afternoon. But the picture of all the leaders in the motor industry wrangling and squabbling over a matter concerning which there should be no dispute—to wit, a perfectly fair ballot for positions at a motor show—is not an

edifying one, and we can only conclude that the entire system adopted upon the occasion is wrong."

Visit to Sir J. H. A. Macdonald.

THE Eastern Section of the Scottish Automobile Club have had a run to Coll-Earn, Auchterarder, to pay a visit to the President of the Scottish Automobile Club, the Right Hon. Sir J. H. A. Macdonald, K.C.B., Lord Justice Clerk, and were there most hospitably entertained to luncheon. Owing probably to the very threatening-looking morning, and to the inconvenience of crossing the five miles of the stormy Forth by the Granton Ferry, few cars went direct from Edinburgh, though there was a fair muster of members from the surrounding country, north, east, and west. Unfortunately, the weather was not on its good behaviour. The members who took part in the run were:—Messrs. W. H. Cox (Snaigow, Dunkeld), 10-h.p. Wolseley; R. Douglas Creall (Edinburgh), 9-h.p. Napier; Drake (Edinburgh), 10-h.p. Stirling-Daimler; P. Drummond (Stirling), 3½-h.p. tricycle; C. J. Hoggan (St. Andrews), 8-h.p. Clement; Wm. Hunter (Edinburgh), 12-h.p. Gobron-Brillie; George Macmillan, Secretary Eastern Section, 7-h.p. Panhard; Thos. Sanderson (Edinburgh), Benz; and J. Stirling (Edinburgh), on a 15-h.p. double Stirling Phaeton. In the absence of the Lord Justice Clerk, who had to go to Dundee to hold a High Court of Justiciary, the company were received by his son, Mr. Norman D. Macdonald, Chairman of the Scottish Automobile Club. His Lordship drove in his Delahaye car from Auchterarder to Dundee, some thirty-seven miles, as being quicker and more convenient than going by train. He is the first judge who has arrived in a circuit town by motor-car. He returned to Auchterarder by the road again, arriving just after the Club had left, owing to the short days and bad state of the weather compelling an early start.

In Cape Town.

THE City Council of Cape Town has made new regulations with regard to automobiles, which are of special interest in view of the considerable number that are being sent out to the Cape. The speed within the area of the municipality is restricted to eight miles an hour, and cars must have two effective brakes able to act independently of each other. At night they must have a white light in front and a red light in the rear. Cars used for public and business service must have the name of the owner or owners, and the place of abode, painted in a conspicuous position on the side of the vehicle, and those employed for goods purposes are required to pay a registration fee of £5. The registration fee of passenger cars is £2 10s.

The 1904 Exhibition.

PLANS are ready for the 1904 Exhibition at the Agricultural Hall, London, which will be held from March 19th to 26th, and already firms are booking space. The anticipations of good business at the Show which opens to-day has led many to be anxious to obtain good positions for next year; and there is no doubt that the Ninth Annual Motor-Car Exhibition at the Agricultural Hall will prove a worthy successor to its predecessors.

The Motor Volunteer Corps.

THE Secretary for War has approved of the following special grant to the Volunteer motor corps. In lieu of all grants given to ordinary volunteer corps (a capitation grant of 40s. for each efficient officer and a capitation grant of 40s. for each efficient member) a capitation grant of 50s. for each proficient officer and sergeant; an allowance of 30s. a day, not exceeding ten days, for each day of attendance of any officer or volunteer on duty with his car, and, where fuel is not obtainable from the stores of the Army Service Corps, a further allowance of 30s. a day, which is also to cover wear and tear of machines.

An advance of three-fourths of the capitation grant will be made as members are enrolled to cover cost of uniform and initial expenses, the recovery being spread equally over the next three years.

Club Arrangements.

THE changes consequent on Mr. C. Johnson's retirement from the secretaryship of the Automobile Club have been considered by a sub-committee of the Club, and the results of their deliberations have just been announced. Mr. Julian Orde is to be the general secretary of the A.C.G.B.I., with Mr. Basil Joy as secretary of the Club trials and garage, and Mr. W. Rees Jeffreys as secretary for the legislative work of the Club. This sectioning of the work appears, in the judgment of the sub-committee, to be absolutely necessary in view of the great development that may be expected in the near future.

The Road Problem.

THE paper by Mr. Jeffreys on the Road Problem summarised on another page draws attention to a very pressing question. Some difficulties in connection with the proposed road were pointed out by Mr. Harold Sanderson; Sir John Thornycroft deprecated the presence of obstructions in the centres of streets; the Hon. Arthur Stanley, M.P., hoped the County Council and the City Corporation might be induced to enter into a joint arrangement; the Hon. J. Scott Montagu paid a high compliment to the author; Messrs. Worby Beaumont and Aveling expressed approval of the paper, and the Chairman, Colonel Crompton, hoped that motor-car builders would show their appreciation of the suggestions by giving attention to the construction of motor-wagons for goods and suitable vehicles for passenger services.

Latest About the Present Show.

AMONG the special attractions at the Motor-Car Exhibition on Club day will be an augmented band, and vocal, as well as instrumental, soloists. It will be remembered that *Le Passe Partout* left the Agricultural Hall nearly a year ago amidst the plaudits of the crowd, having occupied the position of honour during the previous week. How it failed to complete its tour of the world was told in the *Journal* on the 14th ult. Now it stands in the covered yard at the Barford Street entrance to the Motor-Car Exhibition—a dilapidated object with no cylinder head, the chains gone, the pneumatic tyres down, the front of the bonnet absent, and altogether a woeful picture of foiled ambition.

"MOTORS" Co. of the Quadrant, Richmond, have issued a list of privately owned cars that they have for sale.

ON Thursday next Professor Dalby will read a paper at the A.C.G.B.I. on "Vibration Problems in Engineering Science."

AT the monthly dinner of the London Chamber of Commerce on Wednesday, Messrs. S. Straker and C. Jarrott were among the speakers.

AMONG the latest entries in the Paris-Madrid race is one in the heavy car class by the Wolseley Co., and one in the voiturette class by the Eagle Engineering and Motor Co.

PRESSURE on our space has resulted in the omission of several advertisements this week, and firms wishing to ensure a position in the next issue of the *Journal* should send their announcements as early as possible—by Monday if possible.

AT the shareholders' meeting of Messrs. Vickers, Sons, and Maxim, Ltd., on Wednesday, Col. Vickers, who presided, stated that the sum invested in the Wolseley Tool and Motor-car Company gradually rose during the year till it reached, at December 31st, rather over £160,000. The results obtained and expected are such that it is proposed rather to increase than to diminish the amount employed there. The entire capital of the Wolseley Company is owned by Messrs. Vickers,

THE MORS 1903 CARS.

FOR the 1903 season the Mors Company are building three sizes of four-cylinder cars—11-h.p., 18-h.p., and 22-h.p. As the general arrangement of these cars is the same, the following description will apply to all, except where otherwise mentioned. The frame is built up of pressed steel. The front and rear crossbars and the front and rear bars supporting the

Fig. 1.—End View of Mors Engine.

gear box are also of pressed steel. This has permitted a variable section to be given to these pieces according to the stress at different points along their length. The front of the frame is narrowed, to allow of turning in a shorter radius than would otherwise be possible.

The motor (Figs. 1 and 2) is of the four-cylinder type, with mechanically-operated inlet valves. The intake and exhaust

honeycomb type, with a fan to induce a strong current of air through it. The water circulation is maintained by a gear-driven pump. The advantage is claimed for the honeycomb radiator that the motor may be run at slow speed for long periods without evaporating an appreciable amount of water. The trouble of renewing the water supply is therefore avoided. A single carburettor is used for all four cylinders, the pipe from it branching to each pair, and again branching to each cylinder. Special care

Fig. 2.—Side View of Mors Engine.

has been taken in constructing these pipes to equalise the freedom of passage of the explosive mixture to all four inlet valves. The carburettor is an improved form of float-feed, provided with a throttling device so arranged as to give a perfect "mixture" even when the engine is running at the slow speed of 300 revolutions per minute. The governor is adapted to act on the admission of gas, and in conjunction with it is a pedal by means of which the

Fig. 3.—The Mors 18-h.p. Chassis.

valves, which are interchangeable, are located on opposite sides of the cylinders, each set having a separate cam shaft, driven from the crank shaft by spur gears. One peculiarity of construction is that each cylinder is cast separately with its water-jacketed head and valve chambers. The jackets for the cylinder walls, however, are made of aluminium, and are cast in pairs. The cylinders are fixed to the jackets by studs, and the jackets serve to hold them to the crank chamber. The water-cooler is of the

governor can be cut out and the engine "accelerated" as desired, as well as a hand lever working on a sector on the steering wheel, acting as a "moderator."

The ignition system is of the primary, or make and break type, the current being furnished by a rotary magneto driven by the engine by means of spur gear. The stationary insulated electrode passes through the cylinder head, and the movable electrode, which has a rocking motion, through the side wall of the

cylinder. This movable electrode is operated by a rod pushed by a cam on the inlet valve cam shaft.

Formerly the point of ignition in the Mors vehicles was invariable, but in the new models the driver can advance the ignition up to the most favourable point when the engine runs on the high gear at high speed. The variation in the point of ignition is obtained by the displacement of a movable part provided with a roller interposed between the igniter cam and the igniter rod. The displacement of this piece is effected through the intermediary of a lever which is connected to a small handle located on the steering wheel.

A new starting handle is now provided, and consists of a ratchet crank in front, which engages and disengages automatically with the motor shaft. This result is secured as follows: A pawl on the starting handle drops by its weight into a position of disengagement when the handle is in the vertical position, but engages in a notch on a ratchet wheel on the motor shaft when the handle is turned. As soon as the motor speed exceeds the speed with which the handle is turned the ratchet engagement is automatically released.

A new form of conical clutch designed to obviate all end pressure is employed between the motor and the gear box. The new Mors change speed gear, which has already been described in the *Journal*, is used in the new models. Four speeds and reverse motion are available, the drive on the high gear being direct.

Double-acting hand and foot brakes are provided. The hand brake is applied by pulling the lever towards the driver instead of pushing it forward, as is usual. The system of lubrication is based on a new principle. In most systems in which the lubricant is fed to the cylinders by pressure, this pressure is derived from the exhaust. It is claimed, however, that it is most difficult to obtain a constant pressure from this source and one capable of regulation. In the new Mors vehicles the pressure for feeding the lubricant is furnished by the cooling water, which forces the oil through sight feeds, according to the usual method of distribution. The advantage of regularity is claimed for this system, while in addition the oil is maintained at a constant temperature, which facilitates its distribution during cold weather. The road wheels are of equal size, while the wheel base of the 11-h.p. car is 7 ft. 10 in., and of the 18-h.p. car 8 ft. The Roadway Autocar Company, Limited, are the agents for the Mors vehicles in this country.

MOTOR-CAR speed trials are likely to take place at Southport during the summer season.

A MOTOR-CAR garage has been established at 69, Sidbury, Worcester, by Mr. G. Bladder.

THE Daimler Motor Company, Ltd., have commenced the issue of a bi-monthly list of carriages for sale.

MR. MCADAMS is opening a garage in the Avenue Road, West Hartlepool, where he is about to establish a motor-car agency.

IN Hood Street, Newcastle-on-Tyne, Messrs. Kerson and Company have opened a large showroom for the display and sale of motor-cars.

THE Finance Committee of the Wiltshire County Council is recommending that body to purchase a motor-car at a cost of not more than 300 guineas for the use of the county surveyor.

AUTOMOBILES DE LUXE, LIMITED, is the title of a company registered with a capital of £200 to manufacture, repair, buy, sell, let on hire, or otherwise deal in all kinds of motor-cars and accessories.

It is expected that the airship which Dr. Barton, of Beckenham, was commissioned to build for the War Office will be completed about the beginning of August, when experimental trips will be made in the presence of the Department's experts.

CONTINENTAL NOTES.

BY "AUTOMAN."

"FAUTE de grives, on mange des merles" is the motto of the Nice automobile meeting this year, as it was in 1902, when, at the last moment, the Italian Government put a veto on the Nice-Abazzia race, and raised a howl of indignation from manufacturers who had spent considerable sums of money in preparations. The Nice-Abazzia race was replaced by various minor events, but the chief interest of the meeting was gone. This year the French Government has for some unexplained reason vetoed a projected road race and authorised only the La Turbie hill-climb. The mile and kilometre competitions do not need a Governmental sanction, as they take place on the cement footpath of the Promenade des Anglais, which is under municipal control. The A.C.N. are, however, making an effort to replace the prohibited road race by something novel and interesting. In this they have succeeded, so far as concerns what they call the "*Concours au Bidon*," which may be freely translated into the "tin of petrol trial." This will take place on April 4th, when all the competing cars must put in an appearance on the Place d'Armes. The vehicles will then be weighed with passengers, tools, water, and oil; in fact, "with all aboard" with the exception of petrol. The petrol tanks and pipes and the carburettor must be empty. Each competitor will then be given a tin of petrol containing 100 grammes of petrol for every 50 kilos of the weight of his car, and with this petrol he must start off on a fixed course at any speed he likes, and go on until his petrol gives out. The car which accomplishes the greatest distance will be the winner.

ON March 30th and 31st, the A.C.N. will hold a reliability trial, and for this they have taken a leaf out of the book of the A.C.G.B.I. The trial is divided into two chief classes, namely, a competition for big touring cars and one for small touring cars. The former includes only cars with three or more cylinders and carrying at least four passengers comfortably; the latter is for cars with one or two cylinders, carrying two passengers. The competition lasts for two days in each case, but the route is different for the two classes. The big cars will have to accomplish 257 kilometres (160 miles) on the first day, and 300 kilometres (187 miles) on the second day. The small cars will have to travel 128 kilometres (79 miles) the first day, and 200 kilometres (125 miles) the second day. There will also be included two hill climbs. Speed will not count in the competition, but any car taking more than a minimum time to accomplish the distance will be disqualified. The start will be made at any time desired by a competitor between 5 a.m. and 9 a.m., the actual time of starting being placed on record. The hills on which the climbing trials will take place are, first, the ascension of the Col de Braus from the far side of the Pont de l'Escarène, to the sign-post on the top, which indicates the altitude; second, from Grasse to the Col de Saint-Vallier.

AMONGST the entries for the Nice-La Turbie hill-climb is the name of Mr. Alfred Harmsworth. It is said that he will drive a Mercedes car.

THE winter season has caused quite a slump in flying-machines, and the atmosphere is now no longer disturbed by the passage of the navigable balloon, which has been relegated to its winter quarters. The winter is, however, quickly passing away, and already there is a flutter in the aero world. M. Santos Dumont is busy building a big balloon shed, which will house at least three of his airships. He has purchased 12,000 square metres of land facing the Seine at Neuilly, just opposite the island of Puteaux, where the crack summer club for Parisian sportsmen has its home. A familiar sight in the Champs Elysees is the tiny little electric "runabout" of American make, standing outside the residence of M. Santos Dumont, and the dapper little

man in the smart little car, always alone, may be seen on his way to or from Neuilly two or three times a day.

Of the brothers Lebaudy and their airship "Le Jaune" there is hardly any news except that one Don Simoni, an Italian, has attacked them for infringement of his patent, which seems to be for a navigable balloon of the form "trapeze," higher than it is wide, and dwindling almost to a point.

THE Hon. C. S. Rolls' 133½ kilometres an hour has particularly attracted attention in France to the shape of body required for high speeds. This question first came up in automobilism when Count Chasseloup-Laubat and Jenatzy were struggling for speed supremacy, and when a speed 25 per cent. lower than Rolls' record was an achievement which made the world wonder, accomplished as it was on a car with a cigar-shaped body. Serpollet made the next astonishing record on the Easter Egg, of which the peculiar shape is well known to everyone; and now a Mors car which seemed incapable of doing more than 120 kilometres has suddenly, with an inverted boat-shaped body, run up to 133½. It is, therefore, quite evident that the immediate attention of those who wish to score a win in this season's racing

countries the latest improvement. The Archduke Franz Salvator formally opened the Vienna Show, and the Kaiser William the Second visited in person the Berlin Show, expressing his admiration of the state of the industry, and chatting amicably with the representatives present on some of the stands.

A NOVEL and practical trial of the military utility of the steam tractor is about to be made by the Austrian War Office. On Sunday, M. Turgan, of the firm of Turgan-Foy, starts from Paris on one of his steam tractors accompanied by two mechanics. The body of the tractor has been fitted with a cover and with three beds for the three occupants, who will sleep aboard. There is also to be a load of four tons. The tractor is to travel from Paris to Vienna, but it is to be controlled and guided by telegrams from Vienna. Each day instructions will be wired to the driver to make for such and such a city, and so the War Office will see whether it could be relied on in time of war. The journey will take about a fortnight.

THE eight cylinder C.G.V. car was put through its trials at Longchamps last week, its flexibility in the way of speed, being fully demonstrated. The cylinders are 100 mm. diameter by

Plan of M.M.C. 20-h.p. Four-Cylinder Car.

will have to be paid to the question of the shape of the body, which can evidently make a difference of 10 per cent. in the speed of the car. There is also another question which has been raised and will be solved this season. Mors and Serpollet are both experimenting with wheels which have no openings between the spokes—plate wheels, in fact.

I HAD the good fortune to be a witness the other day of some remarkable experiments with a 40-h.p. motor on the testing bed, and supplied with the Eisemann ignition. The motor, with the throttle valve wide open, without touching any of the gas or air connections, but using only, to regulate the speed, the ignition, turned from 850 revolutions down to 112 with absolute regularity, and at the low speed the exhaust pipes were no hotter than at the high speed. There was not a single misfire, the exhaust giving a constant teuf, teuf, teuf, until the motor actually stopped. The experiment was repeated several times over with the same result.

THE motor-car exhibition season is at its height; both Berlin and Vienna are vying with London to show their respective

130 mm. stroke, the engine being nominally rated at 45-h.p. The speed can be regulated as desired between 125 and 1,500 revolutions per minute. The engine transmits its power direct to the differential countershaft and thence by chains. No mechanical change-gear is employed, the speed being entirely controlled by the throttle on the induction.

THE final act in the Criterium de Consommation took place on Monday, when what is known as the "Poule des Vainqueurs" was run off. The following are the results:—

VOITURETTES.

1. 6-h.p. De Dion covered 146.13 kil. on 5 litres of petrol.
2. 6-h.p. De Dion covered 122.3 kil. on 5 litres of petrol.

LIGHT CARS (400 to 650 kilogs.).

1. 6-h.p. Peugeot covered 118.05 kil. on 6 litres of petrol.
2. 6-h.p. Peugeot covered 112.31 kil. on 6 litres of petrol.

CARS from 650 to 1,000 kilogs.

1. 12-h.p. Chenard-Walcker covered 121.3 kil. on 7 litres of petrol.
2. 12-h.p. Chenard-Walcker covered 113.18 kil. on 7 litres of petrol.

HEAVY CARS.

1. 8-h.p. Mors covered 100 kil. on 8.4 litres of petrol.

INDUSTRIAL VEHICLES OVER 1 TON.

1. Peugeot carried 3,200 kil., a distance of 67.3 kil. on 15½ litres of petrol.

THE SIMPLEX VARIABLE-SPEED GEAR.

THE British Simplex Gear Company, of Kensington, W., are introducing a somewhat novel form of mechanism, devised by Mr. W. N. Dumaresq, which is intended to overcome the long-standing difficulty of gradually varying the speed while continuing to transmit power, between the extreme limits of 1 to 4 with the standard type of gear-box, or by the use of a third drum with a range of 1 to 20. Briefly the gear consists of two drums (Figs. 1 and 2), each having a series of small toothed pinions mounted on roller clutches and supported on small cross

Fig. 1.

arms, which are capable of moving along radial slots cut in the sides of the drum. The effect of the roller clutch is to lock the pinion in the pulling direction of the chain and leave it free in the reverse direction. The radial movement of the arms and pinions is effected by rotating two scroll plates, carried on either side of the drum, the scroll plates having spiral threads on their faces, into which the ends of the small cross arms engage (see Fig. 1). The rotation of the scroll plates is effected as follows: On the axle shaft carrying the drum a long slot or groove is cut, in which slides a flat rack having teeth cut on it in a diagonal direction, which teeth engage in similar teeth cut in the bosses of the scroll plates, thus forming a modification of what is known as a "skew gear." It will readily be seen that as the rack is moved forward or backward the scroll plates are caused to rotate in the required direction. A similar rack is provided on each of the axles carrying drums, but has the teeth cut in the opposite direction, so that on the two racks being moved forward together, the arms on one drum expand and on the other drum contract.

Fig. 2.

The actuating racks are moved by a yoke piece at one end, a screw passing through the same, causing the yoke piece (and racks) to travel forward or backward, such screw being actuated in any suitable manner from the motor. The transmitting chain engages in the outermost teeth of the pinions, which being then locked, rotate with the drums, but on the diameter of the drums being altered, each pinion rotates on its own axis sufficiently to allow of the chain adjusting itself. The gear runs practically noiselessly in oil, and is easily adjusted. Its immediate adaptation to motor-car work is intended, and we shall watch its progress with interest.

SOME USEFUL NOTES.

THE following directions for the charging of ignition accumulators are taken from the latest catalogue of Messrs. Peto and Radford, Limited:—An accumulator or storage battery can be re-charged from any source of electric current, such as a primary battery, a small dynamo, or current from the mains of a supply company, provided that the current is continuous and not alternating. (By continuous we mean flowing in one direction.) Whichever method is adopted in charging accumulators, the pressure and quantity of current must be suitably regulated according to the pressure of the charging current and the number of volts of the battery to be charged. The best method of charging is from a continuous-current house service. When this method is adopted the accumulator is inserted in the circuit of one of the lamps used in the house, so that the current flowing through the lamp also goes through the accumulator after leaving the lamp before it returns to the main. In this way, if the lamp does not exceed 32-c.p., a current of not more than one ampere will flow through the battery.

In connecting up a battery for charging, the terminal marked + must be connected to the + wire of the mains, and the terminal marked — to the — of the mains. If the accumulator is connected up the reverse way it will be spoilt. To test which main is positive + pole or negative — pole, pole-finding paper can be used, but we recommend the advice of an electrician being taken when first arranging a charging circuit. The vent plugs of accumulators, when charging, should be removed. When charging in series on 100 or 110 volt circuit, a 32-c.p. lamp in series with a 4 or 6 volt battery, will allow 1 ampere of current to pass through. If the circuit is 200 to 220 volts, use two 32-c.p. lamps to pass the same current. If the voltage of the accumulator to be charged is from 8 to 12 volts, the current passed in series with lamps as above will be slightly less.

ON one of the cars at the recent *Salon* in Paris we noticed the useful improvement in steering wheels illustrated in plan herewith. It will be seen at once that the improved form of wheel allows freer access to the driver's seat than the ordinary form; it has also the advantage, if set truly on the steering pillar, of assisting the driver in making a straight course. We cannot

remember on which particular car we saw the new wheel, but those motorists who like the idea should have no difficulty in getting one made.

AN American motorist, in the course of a letter to a transatlantic contemporary, makes some useful remarks on the question of cooling water circulation, from which we take the following:—"It is not advisable to place a tank of water to be cooled or to be kept cool on top of an engine cylinder. Put the tank at any other place, preferably a cool one, and take the water from the bottom of the tank first through the pump, which must be located so that the water in the tank will flow to it by gravity. The supply pipe of the pump should be large, at least double the size of the outlet. From the pump the water should be forced through the motor jacket, entering at the lowest and leaving at the highest point, then through the radiator and finally into the bottom of the tank. This will prevent any steam getting into the tank.

There are many who run the water directly from the motor into the tank. This leads the hot water, which is perhaps steaming, into the tank where the steam or vapour escapes through the overflow pipe, and causes it to be wasted rapidly. It should pass through the radiator before it goes into the tank, if it goes into the tank at all.

THE very best system I know of does not send any of the water in the circulating system through the tank at all. The latter is only used to supply what is wasted or leaks out of the circulating system, and to accomplish this the supply pipe leading from the tank to the circulating system just in front of the pump contains a check valve, this valve allowing water to pass into the circulating system but not to return to the tank, except through a safety or pressure valve located between the engine and tank. No water will pass through this safety valve except when steam is

vessel in which the sieve is located, from which it may be drawn by means of a cock.

IN those cars in which the "make and break" takes place between the platinum surfaces, these should always be kept scrupulously clean. After being in use some time (quite a short time if abnormally high voltage is used) small corrosion due to volatilisation and re-deposit of the metal, or small pits, will be seen on the surfaces. These should be removed with a fine file, but care must be taken that the newly-filed surfaces are strictly parallel to one another when in position, so that when they come into contact they are in accurate opposition.

SOMETIMES it happens that the piston-rings work round until the slits in them are opposite one another. When this occurs there is sudden loss of compression. The remedy consists in injecting a few drops of paraffin oil into the cylinder while the engine is

Count Siegfried Wimpfen, of Vienna, on his 1903 Gardner-Serpollet Steam Car.

[Allgemeine Automobil Zeitung.]

formed and the pressure of the circulating system is increased to a point determined by the adjustment of the safety valve. The water in the tank not being in communication with the circulating system, is cool, and at once condenses any steam passing into it, while new cold water flows from the tank into the circulating system and the normal condition is at once restored. I pump four gallons a minute through the engine and radiator."

OCCASIONALLY complaints reach us from motorists that the petrol they buy contains water, and that in consequence they experience trouble with their engines. It may be well, therefore, to call attention, remarks the "Horseless Age," to means for effectively separating water from the petrol on its way to the carburettor. It is known that fine mesh wire gauze will not let water pass, while it allows the petrol to flow through it freely. If, then, the petrol is caused to flow upward through a wire gauze sieve, the water will be separated from it and will collect at the bottom of the

running. One or more of the rings will work round after a time and compression will be restored.

WHEN an engine has been running for a short time after paraffin has been injected into the cylinder a reddish deposit will be found on the plug which may interfere with the firing. This is sometimes ascribed to over-lubrication, but is in reality due to the paraffin.

EVERY intending purchaser of a car should insist on the fitting of a petrol gauge if no provision is made for easily estimating the quantity present in the tank. How often have we seen drivers worried by the uncertainty of having sufficient petrol left to carry the car to its destination, and compelled to make some crude measurement by means of a stick thrust into the tank, at the imminent risk of contaminating the spirit, or driven to the necessity of making a rough and frequently inaccurate calculation based on mileage covered and average consumption of engine.

MOTOR-CYCLING NEWS.

THE motor-cycle match between Maurice Fournier and Charles Barden, which was postponed from the 7th inst. on account of the rain, was decided at Canning Town track on Thursday of last week. In the opening mile race (flying start), the Frenchman won by 100 yards in 1 min. 14 $\frac{3}{4}$ sec. The second race (standing start) gave him a still easier victory, for he finished more than half a lap in front of his opponent in 1 min. 40 $\frac{3}{4}$ sec. Barden showed rather better form in the third encounter, but was eventually beaten by 120 yards in 1 min. 18 $\frac{1}{2}$ sec. Fournier afterwards secured the six and seven miles motor-bicycle records, being in each instance two seconds inside the previous best, made by F. W. Chase.

ON Saturday, however, the latter rider retaliated on the same track, reeling off his first mile in 1 min. 27 2-5 secs., and improving at each succeeding mile; so much so, that at six miles (7 mins. 44 secs.) he was 9 secs. inside record, and at 7 miles (8 mins. 59 13-5 secs.) he was 13 secs. inside Fournier's time. From this point Chase established new figures up to ten miles, inclusive, and, completing the ride in splendid trim in 12 mins. 56 4-5 secs., he erased no less than 21 secs. from his own previous world's records, made at the Crystal Palace on

The Motor the Master of the Man.
[Das Schnauferl, Munich.]

September 24th last year. His machine was fitted with a M.M.C. 2 $\frac{1}{2}$ -h.p. engine made at the company's Coventry's works.

At the last meeting of the Sussex Centre of the National Cyclists' Union, held at Littlehampton, the secretary asked for some rules for motor-cycle racing in Sussex, for 1903. Last year there was much friction over the handicapping and the way the motor races were run. At present motor-cycle racing seemed to be in a chaotic state. It was unanimously agreed that in all races under N.C.U. rules in Sussex the ordinary cycling regulations should govern motor-cycle racing, and that in all motor-cycle races the handicapping be undertaken by the official handicappers.

A good deal of discussion is just now taking place anent the relative merits of surface and spray-type carburettors for motor-bicycles. Mr. J. Van Hooydonk considers that spray carburettors are added complications, and even were they to give 10 per cent. more power, it would be far better to make the motor of a size that would allow of the same power being obtained from a surface carburettor. He admits that "when running fast, at speed, the spray, when perfect, will get more power out of a given engine than the surface," but on the other hand he considers that "it is when the speed slows down, in hill climbing, that the spray of the size and type used on motor-bicycles no longer supplies the necessary gas to the motor, and there the

full head of gas, which is always present in a surface, allows more power to be obtained than would be the case were a spray used." The reason for this is, Mr. Hooydonk thinks, "that when running slow the suction or vacuum in the spray carburettor is so reduced that there is not sufficient to cause the carburettor to work under the conditions intended." Mr. E. Arnott, on the other hand, thinks that the complaint against the spray type is largely due to the use of badly-designed devices. While, as compared with these, a good surface carburettor is to be preferred. He himself favours a spray carburettor, so designed, that instead of choking the induction pipe the full quantity of gaseous mixture required by the engine is supplied at all speeds. The question is an interesting one, and if any amateur motor cyclists have considered the matter from the point of view of practical experience with both types we should be glad to have their opinions.

IN connection with this matter of carburettors, Mr. C. Sangster, of the Ariel Cycle Co., Ltd., writes: "In the early days of motor-cycles, when we made tricycles, we proved over and over again that the surface carburettor was superior to any spray carburettor which we could procure or design at that time; but it is possible that this may not be true now. At any rate, we are making experiments, and we will know for certain in a comparatively short time. We are convinced that, taken all round, the surface carburettor will give much better results in the hands of the every-day rider than any form of spray which is likely to be produced in the near future."

A LECTURE on motor-bicycles has been given by Mr. F. H. Wheeler, an engineering student, under the auspices of the Students' Engineering Society of University College, Liverpool. Professor Hele-Shaw presided. The lecturer, by the aid of lantern slides and the black-board, gave intelligent descriptions of the motive systems in different makes of the motor-bicycle.

PROFESSOR H. S. HELE SHAW has accepted the presidency of the Liverpool Motor Cycle Club. A tour in the direction of Morecambe is being arranged by the club for Easter.

A MEETING of motor-cyclists in Edinburgh and district was held on Friday last week. Mr. T. M. Sleight, the convener of the meeting, said the first point for consideration was the desirability or otherwise of forming a motor-cycling club for Edinburgh and district. He thought a club would prove a valuable aid in developing the sport of motor-cycling, as well as a stimulus to the trade. After some discussion the formation of the Edinburgh Motor-Cycling Club was decided upon, and a committee appointed to draft a constitution and rules, which will be submitted to a later meeting.

A MOTOR-CYCLING club is in course of formation at Southampton.

THE Motor Cycle Union of Ireland has just obtained an important concession from the Irish Railway Clearing House whereby motor cycles will be carried by rail at rates double those charged for ordinary cycles. Under the old arrangement such exorbitant charges were made that most motor cyclists were prevented from availing themselves of the railway. A uniform rate throughout Ireland has now been arranged.

ON Saturday last Messrs. Shaw and Lee, Brixton Hill, in conjunction with the Firefly Motor Company, of Croydon, held the first of a series of monthly auction sales of motor-cars and cycles. The catalogue ran to over fifty lots and the interest evinced in the new departure was very great. Over forty cars of various horse-power and types were offered and excellent business resulted. The biddings were keen, and in a number of cases sharp contests ensued for ownership. For the April sale an even larger entry is expected.

A NOVICE'S EXPERIENCE OF MOTOR-CYCLING.

I HAVE now taken the *Journal* a little over two years, and have derived therefrom much useful information from time to time *re* motors, and certainly had my interest in self-propelled road-vehicles aroused by its means. I have now run a motor-tricycle a little over a year and wondered if my experience of what can be done with a small motor (if one really tries to get at the why and wherefore), would be of sufficient interest to the general reader to merit publication.

I am a working master plumber and decorator, and thought a small motor that would carry a few stones of material and self, or self and apprentice with kit of tools, would be of great use to me, as I have several customers at outlying villages in a radius of twelve to fifteen miles, which is not served by rail. I consequently made enquiries and came across a good strong old Beeston tricycle, which had given the first owner much worry, and was then in the hands of a motor engineer, who was running it fairly well, except for ignition troubles. I purchased the machine, getting some useful hints as to driving and managing, and then commenced my own troubles, which at first were really confined to contact breaker, the springs of which rarely lasted above a dozen miles before snapping. Of course I always carried spare ones, but the constant stopping to renew them was disheartening, as they would generally go at the most awkward places. The form was this: a curved top spring, fast at one end to terminal bolt, the other end working in slot; the bottom spring was straight, and with being weakened by the hole in the middle for the platinum rivet the constant "knock" of the plunger from the cam soon did the mischief. One day I had run about forty miles without a break and wondered greatly, so I took the contact-box cover off and found the bottom spring broken just beyond the platinum, the end of the same lying in the bottom of the box. This at once taught me the form required to stand. I then made both springs short with free ends, since which time I have had no trouble. In fact, I have not had to clean the points or adjust them for the last 700 miles. As now arranged the points have a slight rubbing action and thus they clean themselves. My total mileage for last season was about 1,400 miles.

My first real trouble was when I had run the machine about a week. I was twelve miles from home, and suddenly heard a bad scraping; I dismounted, but could not find the cause; tried again, but no better, but ultimately found that the bolt with eccentric ends which carries the motor on the brackets of the bridge had one end gone, so allowing the motor-case to grind on back axle. Here was a job for a novice a week old! However, I set to work and took the motor off, drawing broken bolt out of the crank case, and made my way to a village smith's shop, hoping he might be able to drill same and fix new end in bolt. The job was, however, too light for him and he would not tackle it. I asked him if I might try, and he giving me permission, I set to work with his elaborate machines and managed to drill a fairly true hole. I was then as far off as ever, he not having a suitable tap to thread same. Necessity is, however, the mother of invention; so I rummaged amongst his scrap heap and found an old cycle crank-pin, which proving to be steel, he hardened, and with this I managed to put a decent thread in the hole; the rest was simple, and in less than two hours I was on my way rejoicing. Although I had a new bolt turned and fitted, I still retain my repaired one for a standby.

My next breakdown was more serious—the breaking of the large gear wheel on the back axle. This was beyond my power to remedy. I was five miles from home, so took off the engine pinion wheel and pedalled the machine home. Stoppage No. 3 was one which ought not to have been worthy the name if I had been supplied with spare parts, which all motorists should carry, the head of the exhaust valve breaking. I was eight miles from home, so I took the broken valve out and left the machine on the roadside in care of a cottager, making for home on a bicycle. I managed on my little lathe to turn a brass head for the valve and screwed the old spindle into same, making it as near in size and bevel to the old one as possible. Returning with it and some emery powder, I managed to grind the valve in a tolerable fit, and again got safely home.

Breakdown No. 4, and last up to date, was ignition trouble, which took me over two hours to locate, and the remedying of this I really consider my greatest success, and likely to be of most use to others. Well, in this instance I could get no spark whatever with the plug out, and laid in the usual way on some part of the frame. I tried and tested all points—switch handle, contact breaker, wires, connections, etc.—but all to no purpose; at last I took my accumulators out and tried them across with wire. There was no life there, so concluded I was really done. Now came what I must call an inspiration, viz., the thought to take batteries apart and try each cell separately. I then found one completely dead and the other fairly lively. I then connected this latter up and got a nice spark; putting the plug back in the engine, I started at once, and again got home. The crowning part of this experience is that from that time I have constantly run with one 2-volt cell only as well as ever I ran with both connected; so, although I always carry both fully charged, I only run on one. A point here arises *re* the charging of cells. I think they should never be charged in pairs, but each cell connected to charging board separately; although the current could not force its way through the faulty cell, it was ample to drive the motor when unobstructed by the bad cell.

For the last four or five months I have had nothing but absolute pleasure. Although I suppose my tricycle was originally only intended to carry one, I constantly carry two of my children in a seat I have fixed on spiral springs at the back of the machine, and lately I have got a double trailer, and, in consequence of our roads being very flat, am able to take my wife and eldest daughter about without any difficulty. It is really marvellous what a 2½-h.p. motor will do when kept in good condition and repair. My opinion is that there is more harm done to small motors by careless starting and over-running than all the legitimate running one can give them. In conclusion, I can assure any intending small motorist that the ordinary troubles experienced can, with care, soon become matters of very little moment, but would beg him to remember that, as the motor is doing for him all the hard work, it surely deserves his most careful attention to all its working parts, and I am convinced that (as in my case), it will soon become a real pleasure.

A SATISFIED YORKSHIRE NOVICE.

Motor-Cycle Racing in South Africa.—Getting Ready for the 5-Miles Ha dicap.
[See *Journal*, March 7th.]

THE annual general meeting of the Cyclists' Touring Club was held last week. The principal item on the agenda was one proposing that the constitution of the Club be so altered as to admit automobilists and all tourists to membership. This was defeated by a large majority, but a postal vote has yet to be taken.

THE "JACKSON" CAR.

THE latest American petrol car to be put on the English market is the "Jackson," of which an illustration is given herewith. It is driven by an 8-h.p. horizontal single-cylinder motor, located at about the centre of the frame. The cylinder is 5 in. diameter by 6 in. stroke, the normal speed being 700 revolutions per minute. The ordinary system of electrical ignition is employed, the timing of the spark being mechanically accomplished in connection with the throttling of the mixture, which is furnished by a float-feed carburettor. The water circulation is maintained by a gear-driven pump and radiator, about six gallons of water being carried. The motor is coupled direct to the transmission gear by means of a flange coupling. The change gear is of the Crypto type, giving two speeds forward and a reverse, and is operated by a single lever. On the top speed the power is transmitted direct, without the intervention of any gearing. A single roller chain connects the change-gear shaft with the rear live axle. A spur gear differential is used. The two gears are firmly keyed to the axle core, and the rear hubs are keyed to the opposite ends of the core. Two independent brake bands, acting directly on the outside of the main gears, give the same effect as if each wheel had an independent brake on it, without any of the disadvantage of the latter method. The brake is operated by a pedal, with a locking mechanism, so that the vehicle can be left standing on an incline. The brake bands are operated through a pair of eccentrics. Both axles are tubular, the rear axle having four rows of ball bearings adjustable independently. The front wheels have ball bearings on the steering arms, the heads of the arms being fitted with hardened and ground bushings, which run on the steering head bolt. Artillery wood wheels are used, shod with 3 in. by 28 in. pneumatic tyres. By means of a handle at the side the engine may be started from the driver's seat, the clutch connected with the handle being so arranged that when being used the compression is relieved. The car, which weighs about 9 cwt., has a wheel base of 6 ft. We have not yet had a trial run on one of the new cars. The motor and transmission are readily accessible, and Messrs. R. Reynold Jackson and Co. inform us that the vehicle is extremely silent in operation. The illustration shows the dog-cart seating up to six persons; it is also made as a touring vehicle, with accommodation for two passengers and ample luggage space. We may add that the body is attached to the frame by eight bolts, and all that is necessary to detach it is to remove the bolts, the starting handle chain, and disconnect the ignition wires.

The "Jackson" Dogcart.

At the last Sports meeting at Melbourne two motor cycling races attracted much attention. The first was over a distance of eight miles, H. B. James (20 secs. start) winning in 15 min. 3½ secs. S. Day (1 min. 20 secs.) won the five mile race in 8 min. 34 secs.

THE Anderson Motor Tyre Company, Limited, has been registered with a capital of £2,500 to carry on the business of manufacturers of and dealers in pneumatic and other tyres and wheels for motor-cars, etc. The registered office is at 12, Great Dover Street S.E.

FRAME CONSTRUCTION.

THERE has been very considerable variation in the construction of frames for motor-cars, and a final type has not yet been arrived at. The forms of construction which have received extensive trial include the following: Tubular steel, angle steel, channel steel, steel flitched wood, plain wood, pressed steel, and steel tube with wood filling. All of these forms are still more or less in use, but some are declining in popularity, while others are gaining. As regards the tubular body frame construction, the main objection to it is the difficulty of properly fastening the mechanism to it. Plain angle steel is also rarely employed, as angle steel lined with wood furnishes a construction better able to withstand shocks and weighing less for a given strength. The steel flitched wood frame was almost universal with leading French makers last year, but this season pressed steel construction seems to be in the lead with these same makers. Pressed steel frames necessitate a more expensive manufacturing equipment than any of the other forms of construction, and if such frames should prove mechanically superior to the other kinds, they are likely to gain in popularity as motor-cars are manufactured in greater number after the same pattern.

The conclusion to be drawn from the results of experiments so far and the various changes made is, considers the "Horseless Age," that a combination of wood and steel in some form makes

the best frame for automobiles, the steel providing the necessary rigidity for connections, making it impossible for the parts attached to the frame to be displaced therefrom, and the wood giving the whole frame a certain elasticity, which is beneficial alike to the life of the frame and to the proper operation of the machinery placed on it. That a combination of wood and steel makes the most durable structure for a road vehicle had already been discovered by carriage builders, and has now been reaffirmed by the experience of automobile manufacturers.

There are, however, a great many possible variations in the combination of wood and steel for this purpose, and the problem now is to determine the most suitable combination, having regard to cost of manufacture, strength for a given weight, and durability.

THE London Traffic Commission is holding its sittings in the large room of Caxton Hall, Westminster.

THE Continental Caoutchouc and Gutta Percha Company are making arrangements for the provision of mechanics skilled in tyre repairs for the benefit of competitors in the forthcoming Gordon Bennett race.

MR. C. M. MATHESON, of the Matheson Motor-Car Company, of Grand Rapids, Mich., announces that he and Mr. J. B. Hedges, both of whom will try for a position in the American Gordon Bennett team, have entered for the Paris-Madrid race and the Ardennes Circuit race.

CLARKSON, LIMITED, is the title of a company registered with a capital of £1,000 in £1 shares, to acquire the business of the Clarkson and Capel Steam-Car Syndicate, Limited, and to carry on the business of manufacturers of steam and other motors, etc. The first directors are Messrs. F. Fremlin (chairman), A. Jones, and T. Clarkson. Registered office, Moulsham Works, Chelmsford, Essex.

HERE AND THERE.

MR. T. HEY, the hon. treasurer of the Yorkshire Automobile Club, has a 20 to 24-h.p. Spyker car on order.

A MOTOR omnibus plying along the front at Hastings has attracted considerable attention there during the last few days.

View of Motor of 1903 60 h.p. Mercedes Car.
(Allgemeine Automobil Zeitung.)

TRIALS of the Hans motor lawn mower are to be allowed at Lord's cricket ground, and will be witnessed by the head grounds-men of many county cricket clubs.

IN the U.S. 1903 Post Office Appropriation Bill, authority is given to appropriate a sum of £20,000 for the employment of automobiles in the postal service.

AN accident was caused at Montboron Hill, between Nice and Villefranche, by an automobile, driven by Mr. Lindsay Scott, colliding with a heavy wagon. The wagoner, who was seriously injured, was conveyed by Mr. Scott to the Nice Hospital.

THE Scottish Automobile Club are preparing lists of hotels, storage depots, petrol suppliers, repairers, etc., throughout Scotland, and petrol dealers, engineers, etc., who are desirous of having their names inserted should communicate with the General Secretary, 59, St. Vincent Street, Glasgow, without delay.

THE Bath Garage and Motor Company (Fuller's), Limited, has been registered with a capital of £10,000 to adopt an agreement with Mr. W. T. Edgar, to acquire the business of the Bath Garage and Auto-Car Company. The first directors are Messrs. S. C. L. Fuller, W. T. Edgar, and R. C. L. Fuller.

A DAILY automobile service has been established between Guadeloupe and the town of Ste. Rose, Guadeloupe. This service is the first step towards the substitution throughout the colony of automobiles for the archaic stage coaches which were the only means of land transport. Two new lines will be shortly established, one from Guadeloupe to Basse Terre and the other from Guadeloupe to Le Moule. The cars used are of French manufacture and of the petrol type.

A NEW lead accumulator for electrical cars possessing several features of great interest is, reports the "Electrical Review," about to be brought out. The plates are of the Planté type; only five are required for capacities up to 250 ampere-hours—three negatives and two positives. A cell of this type, rated at 120 ampere-hours and weighing 22 lbs., has been charged in less than an hour, and discharged in three hours, with a remarkably high quantity efficiency. Moreover, two-thirds of the full charge can be put in within a quarter of an hour.

FOUR self-propelled vehicles are owned by the Liverpool Corporation.

MR. SCARISBROOK, the Mayor of Southport, has been enjoying a motor-car tour in France.

THE dimensions of the 100-h.p. "Automotor" petrol motor illustrated in our last issue are 160 mm. bore by 260 mm. stroke

M. SERPOLLET has expressed a desire for a motor-car race with the Hon. C. S. Rolls on the Promenade des Anglais, at Nice.

THE Sheffield Motor Company, of Broomhall Street, Sheffield, are now catering for the wants of motorists by keeping a stock of petroleum spirit.

THE exports of automobiles from the United States during January last were valued at £22,874, as compared with £5,462 during the same month last year.

ON Friday next, before the Aeronautical Institute and Club, Mr. E. Gaudron will give a lecture on "Twenty-four Years of Ballooning," Dr. F. Alex. Barton presiding.

THE U.S. Treasury Department has decided that automobiles shall be admitted into the United States without paying duty for a period of four months on their owners furnishing a bond.

IN the plan of the Motor-car Exhibition published last week, the General Motor Garage should have been the Great Central Garage, Limited. The Highgate Motor-car Company is also exhibiting.

AT a meeting of shareholders of Frank F. Wellington, Limited, on Friday last week, dividends were declared at the rate of 6 per cent. on preference shares and $7\frac{1}{2}$ per cent. on the ordinary, a balance being carried forward.

THE accompanying illustration shows the new type of omnibus body which Messrs. C. S. Rolls and Co. have lately introduced. As will be seen, it is fitted with detachable top which enables motorists to have either a completely close,

omnibus, or an open wagonette at choice, without having to buy two different cars. The bus body is shown attached to a Panhard car, but it is equally well adapted to other vehicles in which the motor is located in the fore-part of the frame.

WITH regard to the external jump gap ignition, Mr. W. McL. Dann, of Newcastle, writes that this is a very old dodge with oil engines, and was known at least eleven years ago. "At that time it was not generally understood, and was only used on troublesome engines when ignition was very irregular, but on the introduction of the marine oil engine, with explosions both top and bottom of the piston, it came into everyday use. On several occasions during 1894 and 1895 I did passages of 500 miles with this method of ignition." It is a pity that Mr. Dann kept this valuable information to himself so long. Certain it is that the external gap, be it a new or old idea, is of great importance to automobilists.

MESSRS. S. BROWN AND COMPANY, who have removed their show-room from New Street to Yeoman's Row, Brompton Road, S.W., have opened a repair shop and garage at 29, Chapel Place, Brompton Road, S.W.

MESSRS. JOSEPH LUCAS, LTD., of Birmingham, have recently brought out the useful little fitting illustrated herewith. As will be seen, it is a plated bracket attachment for fixing motor horns

conveniently on the steering wheel. Two sizes of the bracket are made—a short one for use on flat wheels and a long one for dished wheels.

MESSRS. C. W. BLUEMEL AND BROS. have lately put on the market the four-volt test lamp illustrated herewith. The use of such lamps for testing accumulators is known to most motorists, but the form hitherto available has had a drawback in the liability to breakage either in the pocket or toolbag. The Bluemel lamp, as will be seen, is fitted inside an ebonite case, so that it can be carried without risk of breakage. In the upper end of the case a lens is inserted, so that the lamp can be seen without removing the cover. Two yards of insulated wire are fitted to each lamp, affording the additional advantage that at night this can be attached to the accumulator terminals, and a perfectly safe light thus obtained, in case of any adjustment being necessary to the car or cycle, where a naked light would prove dangerous. In a slightly cheaper form the lamp is supplied with the ebonite case, but without the lens top. By connecting up the wires of the lamp to the terminals of the accumulator a test is provided of ascertaining that cells are in good condition, without the risk of short-circuiting the cells. If the accumulator has still a sufficient charge the lamp should glow very brightly; if it only glows dimly

the accumulators are down, and a run should not be risked without recharging. The lamp also provides a ready means for the discovery of a short circuit, in the primary wiring, one end of the wire should be attached first to the negative terminal of the accumulator and a test made along positive wire or lead to the terminal, or from the positive of the accumulator along negative wire or lead to its terminal, the wire which is leaking to earth being quickly shown by the lamp failing to glow, when in circuit. The first test should always be made at the accumulator, then the whole primary circuit, with the interrupter plug in position and switch on. Hold the wire of the lamp to the insulated screw on contact breaker (the screws must not touch the trembler) and the other lamp wire to the trembler blade. If the lamp glows brightly it proves the primary circuit is perfect, and that the leak (if any) is on the high tension wire from the coil to sparking plug. The lamp takes a current of slightly under one ampere, so that it can be used without risk of rapidly discharging the accumulators.

ON Saturday, the 28th inst., the Western Section of the Scottish Automobile Club will hold a run to Ayr.

FROM the E. R. Thomas Motor Company, of Buffalo, New York, U.S.A., comes a copy of their fourth annual catalogue, in which illustrated descriptions are given of the Thomas 8-h.p. car and the Thomas 2½-h.p. motor-bicycle.

THE engineering possibilities of the Garden City are sketched out in a pamphlet written by Mr. H. Guthrie, a Manchester engineer. It will, according to him, be a quiet city; all vehicles will have rubber tyres, and horses will disappear.

THE Warwickshire Farmers' Association have had suggested to them the desirability of calling the attention of the President of the Board of Agriculture to the advisability of taxing heavy motor traffic passing over roads repaired by the farmers.

AMONG the many new sparking plugs that have lately been introduced is the Pognon illustrated herewith. It is made by M. Pognon, of Verdun-sur-Meuse, and that it has features of merit is evidenced by the fact that it has already been adopted by a number of leading concerns in France, including Panhard-Levassor and Georges Richard. The plug is formed of a steel cylinder, containing three sections of porcelain, with a steel rod running through the centre for the passage of the current. At the sparking end, both porcelain and the steel portion of the plug are cup shaped, so that there is a considerable space between the porcelain and the steel rod, and the porcelain and the sides of the steel cylinder. It is claimed that there is thus no chance

of a short circuit being formed through oil or soot bridging over the space. In fact, it is stated that it will spark even when immersed in oil. The plug will be on view on Mr. J. E. Hutton's stand at the Exhibition which opens to-day (Saturday).

MR. A. F. ILSEY has resigned his appointment with Messrs. A. J. Wilson and Company, Limited, in order to join Mr. Van Hooydonk and assist in the development of the business in Phoenix motor-cycles.

A MOTOR department of the Army Service Corps is being formed, and a company of the corps, under Major C. E. McNulty and Lieut. H. R. Hayter, has arrived at Chatham to go through a course of instruction in field traction engines and motor carriages for military purposes.

FINE new show-rooms have been taken by Messrs. John D. Hill and Company at 106, Great Portland Street, W. The premises are fitted with a hydraulic lift from the basement and admirably adapted for the purposes of the firm, which starts under very favourable auspices. It is the intention to deal only in high grade cars.

LAST Saturday's visit of the Nottingham Club to Narpanton was again spoiled by the bad weather. Among the participants were Mr. Walter Foster (son of Sir W. Foster, M.P.) on a 12-h.p. Gladiator; Mr. H. Belcher, on a 12-h.p. Humber; Mr. G. Hodson, of Loughborough, on a 6½-h.p. Darracq, and Dr. Palmer, of Nottingham, on a 5-h.p. Peugeot.

THE Danish Chamber of Deputies has fixed the speed limit of motor-cars at 30 kilometres (18½ miles) per hour on country roads, and 15 kilometres (9½ miles) in towns.

IN the "Poule des Vainqueurs," held at Suresnes, near Paris, on Monday, the 12-h.p. Chenard-Walcker car covered a distance of 121.3 kil. on 7 litres of petrol, equivalent to 49½ miles to the gallon.

WATER CIRCULATION EFFICIENCY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have noticed some remarks about the efficiency of coolers and their joints; I think the following a rather severe trial. I left Wroxham, near Norwich, with the cooler filled up with three gallons of water, drove to London, was four days running about town, and then journeyed back to Wroxham by road, never putting in a drop of water during the whole time. This is the usual cooler as fixed to the Brooke car; the circulation was perfect and the motor ran well up to the finish. As regards joints, I certainly do not hold with soldered joints; the simple rubber rings as used on the Clarkson pipes are much better and will last for years.—Yours truly,

E. ESTCOURT.

MECHANICALLY-OPERATED INLET VALVE FOR BENZ CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In a recent issue of the *Journal* you described an arrangement lately put on the market by which the present suction inlet valve of the 3½-h.p. Benz motor could be converted into a mechanically-operated valve, with consequent gain of power and regularity of running. Being the possessor of a 3½-h.p. Benz, I contemplate effecting the change, but before doing so I should be glad of some independent opinion as to the safety of a mechanically-operated inlet valve used in conjunction with a surface carburettor.

My fear is that, should any slight error occur in the timing, some of the exhaust gases might escape through the prematurely opened inlet valve to the carburettor and cause either explosion or fire. I am aware, of course, of the protection of the gauze box, but am afraid that the gauze, if subjected to the heated exhaust gases, would soon burn through, and a catastrophe would be the first intimation of the damage.—Yours truly,

A. G. J.

AUXILIARY STAND-BY FOR MAGNETO IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think the following account of an experiment I have just carried out for a friend of mine, Mr. Chatfield Clarke, who owns a Beaufort car with magneto ignition, will prove of great interest to all owners of cars with this method of ignition. Hitherto, I believe, when such motorists have asked for some form of portable auxiliary ignition to carry with them, in case the magneto broke down, they have always been told that there were insuperable difficulties in obtaining this, and that they must be content with the magneto only, and, in fact, take their chance.

In order to assist my friend, I have lately been trying various experiments, and, at last, hit upon a simple form of six dry cells, and a specially wound coil, with which, we found, the car ran perfectly at all speeds, and on all gradients. As the dry cells are of a specially durable type, and as they and the coil fit into a small wooden box some 8 inches by 10 inches, which can be carried on the off-side step, it would appear from this experiment that a simple addition can now be made, without in any way interfering with, or altering, the magneto ignition, but should the latter become deranged from any cause, its place is immediately taken by the cells.—Yours truly,

E. DU BOULAY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It may interest the owners of cars with magneto ignition to know that it is possible to fit a very simple and inexpensive supplementary ignition, which is a very useful reserve, if, by any chance, the magneto should fail on the road. This, of course, is very unlikely, still it has hitherto been the great objection to magneto ignition that one can do nothing to it if the magneto does go wrong on the road, whereas one can usually repair a coil, or recharge an accumulator, or buy new dry batteries. However, this week Captain du Boulay tried running my 12-h.p. Beaufort car with dry batteries and a coil on the low tension system, detaching the magneto wires, and attaching the wires from the batteries and coil to the ordinary rocking plugs. A grand spark was obtained, the engine started at the first turn, and ran beautifully, giving off even more power, if possible, than with the magneto. The sparking advance lever worked just the same as with the magneto, and it was possible to advance or retard the ignition quite easily without any further complication. I carry the coil and batteries in a small box on the off-step, and with two short lengths of wire and an ordinary switch, I have a very reliable duplicate ignition in reserve in case the magneto should fail.—Yours faithfully,

A. H. P. CLARKE.

THE GORDON BENNETT RACE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in your last issue an anonymous letter which suggests that because I am a member of the Committee appointed by the Automobile Club to settle controls and where the road requires improving for the Gordon Bennett race, that, in some way, gives me an unfair advantage over other competitors.

This letter has evidently been written by someone who does not read the current newspapers, as the Automobile Club have already provided against anybody practising over the course except on a relatively slow vehicle, and of low horse-power. If one chooses to practise on a small touring vehicle, over the course, it is perfectly open for every competitor to do so, and to do it every day from now to the race!

The fact that I am acting on the Committee is an actual disadvantage from a practice point of view; as, unfortunately, my time for journeys to Ireland is limited, and the days that I am employed helping to settle controls, interviewing road surveyors, etc., reduces the number of days on which I might practise driving over the chosen route. It is less than two years ago that anonymous writers mentioned that my failure in the 1901 Gordon Bennett race was because I did not practise over the course as the Frenchmen did! Now I notice a correspondent seems to be frightened that the rules passed for the interest of all concerned may not sufficiently safeguard the foreign interests.

I think if your correspondent signs his name his letter will be better appreciated by your readers.—Yours truly,

S. F. EDGE.

MOTOR-CARS FOR MEN OF MODERATE MEANS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—No doubt there are a great number of your readers who are hesitating about buying a motor-car because they are under the impression that it will require a mechanic to look after it and do any slight repairs that are required. Since I bought my car some nine months ago I have had the gear box, differential gear, and every part of it to pieces, without any

outside help or any previous knowledge or experience in engineering. The enclosed photo is taken of myself at work on the car at the rear of my premises. As will be seen, the cylinder and bonnet are dismounted; the bonnet is a water-cooling arrangement on the thermo-syphon principle. You will notice that the car, which is a 5-h.p. Argyll, is run up on to a wooden platform, which I made myself, so as to afford better facilities for cleaning and overhauling.—Yours faithfully,

ROBERT BAINES.

CHAINS AND LIVE AXLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice that in your last number "Jack-in-the-Box" writes implying that the presence of chains on certain cars he names gets rid of bevel gear with its chance of break-down. Further, he advances the theory that, while chains are reliable, bevel gear cannot by engineers be made to stand, and is therefore avoided, and chains used by preference. Will you permit me to point out that neither of these is accurate? All but one (if not all) of the cars he names use bevel gear, the chains being merely an additional complication. As to reliability, gear, whether internal, external, or bevel, has been a perfectly recognised means of transmitting power reliably for many years, and there are numbers of gears which run their nine hours or more a day, year in and year out, and have done for years. How many chains do that? There should be no possible excuse for a gear wheel either stripping or wearing out for years, unless it is damaged by the system of changing gear at present used. On the other hand,

however well a chain is up to its work it has practically to be run naked, and so is always liable to damage.

No one disputes that makers "weigh the pros and cons" of what they do, as in fact Noah probably did when he built the ark of wood. This does not the least prove that everything they take up is right; the fact that they all do different things and constantly change their designs proves that they do not themselves think so.—Yours truly,

F. STRICKLAND, M.I.M.E.

THE NUMBERING QUESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—An article appears in the *Automobile Club Journal* of March 12th, headed "Identification," in which it is said that I signed a letter which was circulated in the Press in March last year, on behalf of the Eastern Section of the Scottish Automobile Club, in which it was urged that the Government should pass a Bill including identification "to prevent the dangerous or inconsiderate driving so often indulged in by a majority of motor drivers."

As I am made by such a statement to voice the views of the Eastern Section of the S.A.C. in a manner exactly opposite to what they really are, I think there must be some mistake. I wrote to the Secretary of the A.C.G.B.I. to ask what the document was. He referred me to page 17 of a Blue-book, "The Law as to Motor Vehicles, what it is and what it should be." There I find a letter signed by the whole General Council of the A.C.G.B.I., in the course of which it is said that the Club feels that the proviso of the County Councils' Association, viz., "That there should be an easy and complete means of identification," is one to recommend itself to all drivers of motor-vehicles.

As I do not remember having signed such a document, and as I see that the signatures include those of persons who are quite opposed to numbering, and, further, as I see that I am made to sign the word "Chairman" after my name, whereas I am not even an office-bearer of our Eastern Section, it looks as if the names of the General Council had been simply printed at the bottom of the document *en bloc*, or possibly the paragraph has been put into the document without signature. I have asked my friend, Mr. John Macdonald, whose signature appears below mine, and who is the Chairman of the Eastern Section, whether he remembers signing such a document? He bears me out in saying that he does not recollect such a matter coming before the Committee of his Section, and says that he is very unlikely to have signed anything without their knowledge.

I remember signing on behalf of our General Council a document put before us by the Secretary and which we were told was an appeal in the matter of heavy road vehicles, their tare, wheels, &c., such as is printed at the top of page 18 in the Blue-book. If I did sign a document without carefully reading it because it was sent from the A.C.G.B.I., I owe an apology not only to the Eastern Section but to the whole S.A.C., for seeming to make them support a proposal which is the exact opposite of what they wish.

I am not blaming anyone in these remarks, as there may have been some mistake, but I wish to guard against any idea that the Scottish Automobile Club is in favour of numbering or registration.

Passing from these points to the article in the *Club Journal* itself, I feel that the members of the Club have a right to resent such stuff being written in a journal which is supported by their money and exists for their information and pleasure. It seems a complete tirade against the members of the Club, whipping them soundly and sending them off to bed and demanding from them that they shall make some problematical statements as to how certain things are to be worked in the future, if they refuse to give up their liberties as free citizens and to allow themselves to be ticketed as being undesirable persons.

If our Committee would confine itself to impressing upon Ministers, Members of Parliament, and Government Departments that the best thing which can be done is to leave the matter alone till the people have recovered sense—which I believe they have done already—then we should have nothing to complain of. There has been far too much fussiness and trying to ride with the hounds and to run with the hare in the whole matter.

I have been made to express the very opposite of the views of the Eastern Section of the S.A.C. I have now pleasure in giving their true views as expressed at a full and free meeting in the following resolution, which was sent to the Secretary of the A.C.G.B.I.:—"That the Eastern Section of the Scottish Automobile Club are of opinion that while they are in favour of the removal of the speed limit, they consider that it is a mistaken policy for the Automobile Club of Great Britain and Ireland to introduce any Bill to Parliament; that the true policy for the Club to pursue is to act on the defensive and watch jealously any attempt to alter the present regulations."—Yours truly,

NORMAN D. MACDONALD.

[Pressure on our space compels us to omit Mr. Norman Macdonald's criticisms of the official article on "Identification," with which, however, Earl Russell deals in the next column.—Ed. *M.C.J.*]

DR. W. W. HARDWICKE, replying to Dr. Fennings in our issue of the 7th inst., says that he has found the spark intensifier supplied by the Automobile Accessories Company perfectly safe in use. In reply to Mr. E. Estcourt, if he had placed the saturated rag of his experiment *under* instead of *over* the open spark for a few moments he would most probably have had an explosion, as the fumes of petrol vapour, being so much lighter than air, rise and do not descend.

EARL RUSSELL AND "NUMBERING."

THE following letter has been addressed to the editor of the "*Automobile Club Journal*" by Earl Russell:—"I am amazed to see that the persons who are responsible for the conduct of the *Club Journal* are still continuing their disingenuous campaign of misrepresentation on the numbering proposal. I should have thought that the meeting of the 6th inst. would have settled this question, and would at any rate have taught the Committee to try not to misrepresent the views of the members of the Club. What, Sir, happened at that meeting? A resolution was moved to the effect that the Club declared itself totally opposed to conspicuous names or numbers on motor-cars. After a long and exhaustive discussion, as is shown by the report of the meeting in another column of the same journal, this motion was unanimously carried, Mr. Roger Wallace and Mr. Scott Montagu themselves voting for it.

Now, how is the result of this meeting represented in the *Club Journal*? No note whatever appears among the short paragraphs as to the discussion and its result, but at the end of these come four columns in large print of misrepresentations and threats against the membership in general, if they venture to support the unanimous vote of this representative meeting. I for one, Sir, shall require to know at some future time by what authority this has been sanctioned. We know that the campaign for numbering has been carried on by stating that the Club Committee were unanimous in its favour; we know that they have issued at the expense of the Club unlimited Blue-books and reports and notices to the Press, as to their strong and unanimous feeling on this question; and we know that finally they held a conference with some other Committee and allowed this to be represented in the Press as expressing the unanimous opinion of the Club.

"I have said before, and the appearance of the present *Club Journal* compels me now to repeat, that this action is unworthy of a Committee which pretends to represent its electors, but seems to wish only to represent itself. For a whole year I have been labouring to force the Committee into the open and to compel them to meet the membership face to face. When they at last do so, a unanimous vote is taken against them in which all the members of the Committee present themselves joined, and yet the next issue of the *Journal* is used to misrepresent in the most conspicuous position the significance of that meeting.

"Now I take the statements in the article headed 'Identification' one by one. The first is that no members protested by sending in their requisition for a special meeting of the Club. I, and no doubt many other members, protested at once by writing to the Secretary. We did not at that time suppose that the Committee would maintain an attitude opposed to the whole Club for fifteen months without giving us an opportunity for discussion, and we thought it more courteous to leave it to them to fix the opportunity. In response to my repeated pressure the Committee promised a discussion on this matter on November 6th. That discussion was postponed at the last moment without even the courtesy of a notice to me, although I had kept the evening free at special inconvenience, on the flimsy pretext that Mr. Scott Montagu's Bill had no opportunity of passing into law, a fact which was known to everyone from the beginning.

"The second point is that the principle of conceding identification, etc., was confirmed by a letter signed by many prominent members of the Council. Who cares? The point is whether this principle is conceded by the members of the Club as a whole, and not by some particular bigwigs ignorant of the practice of motoring and taken in by specious arguments.

"The third point is an attempt to belittle the meeting that was held. If the Committee thought the matter of any importance, why did they not send a special invitation to the General Council and to the Club Committee to attend? And, having done their best to make it a hole and corner meeting by not advertising it prominently, why do they complain that only eighty-one members attended? I wonder they do not go a step further and deny that the Chairman of the Club and the author of the Bill in question were present.

"The fourth misrepresentation is the statement that the meeting decided that a memorandum setting out the reasons for the action of the Legislative Committee and the opinions of the opposition should be prepared and circulated to members in order to obtain a postal vote. What the meeting did agree to was that the report of the proceedings at the meeting should be sent out and that three of the opponents should be added to the Legislative Committee to draft the form of the questions in order to obtain a fair expression of opinion on the vote, and to that there can be no possible objection. But will it be believed that in the report of the meeting on page 288 there is no sort of suggestion that still another of these one-sided memorandums presenting the Committee's short-sighted views should be sent out to the members?

"For these reasons I protest most emphatically against the extraordinary attitude which the Committee, as represented by their private organ, have thought fit to take up, and against their ridiculous threat that members of importance will resign their membership of the Club. If this be true, which I doubt, it only shows that such persons are not prepared to abide, as I said I was prepared to abide, by the decision of the majority, and are, therefore, unfit to be members of any organisation with a democratic basis. This attitude of domineering and maintenance of oligarchical rule has long been suspected by the general body of the membership, but I confess that I did not expect to find the Club organ so shamelessly avowing it.

"Finally, a week has elapsed, but the co-opted members have not yet been summoned to any meeting of the Legislative Committee to make the preparations for the postal vote. Why is this? I conclude with the same sentiment as that with which I began, that at the proper time I shall take the proper constitutional method of enquiring who is responsible for the publication of this official *communiqué* so diametrically opposed to the attitude of the responsible members of the Committee when face to face with the public meeting.—I am, Sir, your obedient servant, "RUSSELL"

THE ROAD PROBLEM.*

By W. REES JEFFREYS.

- (1) How to construct new roads suitable for rapid traffic.
- (2) How to improve and widen the roads that already exist; and
- (3) How to regulate the traffic on both the new and the improved roads.

I frankly admit that it is to the first of these questions that I attach the greatest importance, viz., how can new roads suitable for rapid traffic be provided?

But it will be obvious that the provision of new roads through and out of the great cities raises at once financial problems of enormous magnitude. But these difficulties must be overcome if we are to secure the building of new roads. I have come to the conclusion that if the schemes are to be realised it must be largely by private enterprise and private capital. If new trunk roads are to be built, trunk road building must be once more brought within the domain of private enterprise. I would call your attention, however, to the following facts:—

(1) Since the abolition of the turnpike system no new main roads through and out of the large towns have been built in this country.

(2) Most of the existing roads were constructed by private enterprise and financed by private capital.

(3) There is little hope that either the State or the local authorities will find very much money for building new roads.

The public authorities have entirely failed to provide new arterial thoroughfares, essential though these be to the development of the country. The question is whether it is possible to make road building a profitable enterprise. It is to the interest of private capitalists to combine together to build railways, tubes, and trams, and, in consequence, railways, tubes, and trams are built. It is to nobody's interest to build trunk roads, and, therefore, these are not constructed. Can we, however, by legislation make it as profitable to the private capitalist to build trunk roads as to build railways, tubes, and trams? It may, I think, be possible to answer this question in the affirmative.

In the immediate vicinity of all large cities there is land possessing little more than agricultural value, because it is not served by any arterial thoroughfare. Hitherto Parliament has only granted to railway and other companies compulsory powers to acquire land for the immediate purpose of the undertaking. A new precedent must be created. The promoters of the road must be permitted to acquire compulsorily the land which their road would improve. The road-building company would, after it has constructed the road, be in a position to sell or lease this land at very greatly enhanced values, and that enhanced value would not only pay for the cost of the road, but leave a considerable profit. The company would be far more than a road company. It would be a land development and transport company. It would build houses and tramways as well as roads. And the profits from lands, houses, and tramways would yield a handsome return upon the sum invested—a return which would increase as the City developed and the population increased.

I venture to advance, as a general proposition, that in a growing industrial district, where population is increasing, the building of a new arterial thoroughfare would increase the value of the land through which it passes, and if that increased value can be secured to the builders of the road, it becomes at once a financially practicable undertaking.

The position may be summarised as follows:—

(1) New motor roads are necessary to the full use of mechanically-propelled vehicles.

(2) That there is no reasonable expectation that such roads will be provided by (a) the State, or (b) the local authorities.

(3) That there is a possibility of inducing private enterprise and private capital to build such roads, with perhaps some small assistance from the State and the local authorities.

Whether motor roads are provided by private enterprise depends almost entirely upon the Automobile Club. It is the only organisation sufficiently interested and with adequate resources and influence to take the initiative in the matter.

It need hardly be pointed out that the Club has only to show the way and others will follow. Demonstrate that the building of trunk roads is a profitable form of investment for private capital, and capitalists will undertake the work for every large town in the United Kingdom.

I suggest that the following course of action should be considered. The Club should formulate a cut-and-dried scheme for a new road out of London. The scheme should show as exactly as may be (1) what such a road will cost; (2) what conditions are necessary to secure a profitable return upon the money invested. The scheme should then be laid before the Royal Commission on London Locomotion. The Club could say:—

Gentlemen, if Parliament can be induced as a result of your recommendations to comply with the conditions necessary to make the building of this road a profitable undertaking, we will form a company and raise the money to build it.

I venture to suggest that a new road from fifteen to twenty miles long can be profitably built through the suburbs of London if the following conditions can be complied with:—

(1) That compulsory powers are given to the promoters to acquire a strip of land fifteen, twenty, or more miles long and a quarter of a mile wide—i.e., the land for, say, one-eighth of a mile upon both sides of the proposed road.

(2) That the promoters are permitted to build, in addition to a track for the horse-drawn traffic—which will be taken over and maintained by the local authorities in the ordinary way—(a) a tramway track for both passenger and goods traffic, and (b) a motor road.

(3) That the tramway track and the motor track remain the property of the company, who shall be permitted to charge tolls for their use.

An arrangement preferable to the levying of tolls upon the traffic using the motor road would be the payment by the State of an annual sum in respect thereof. In other words, the road as a main road should share in the Exchequer grant.

The sources of revenue to the company would be:—

(1) The ground rent from the land let on building leases and fronting upon the road.

(2) The profits from the tramway track, which, as it would be built upon lands acquired, would not be subject to a purchase clause. Market garden and dairy produce would be carried throughout the night.

(3) Tolls from the fast traffic, or contributions from the State or local authorities in lieu of tolls;

(4) Subsidiary source of income, such as the supply of electric current to the houses on the estate for lighting purposes, to factories for manufacturing purposes, and to owners of electric cars. All the hotels and licensed houses upon the estate could be profitably kept in the hands of the company.

Towards the prime cost of building, the company might receive:—

(1) A grant in aid from the State. (Although I do not believe that the State will find all the money to build new roads, I think it would contribute to their cost, as it already contributes to the cost of some light railways made by private enterprise).

(2) A grant from the London County Council, whose policy is to promote schemes for housing the London population upon agricultural land outside the county.

I submit that the Automobile Club could not spend £1,000 to more advantage than in securing the services of an eminent road engineer, a leading surveyor and valuer, and an able Parliamentary agent to prepare a definite scheme, which could be laid before the Royal Commission and the Government for a new motor road out of London.

I suggest that a proposal for a road of this character should be laid before the Royal Commission on London Locomotion, although at the present time there does not exist any administrative machinery by which it can be carried out at the public expense.

If there is any road in the country which we might expect to be kept in the best of condition, it is the one extending from London to Carlisle—the Great North road—that historic highway which forms the principal means of road communication between the two capital towns of Great Britain.

Most of us, both on bicycle and motor-car, have travelled this highway. We have come upon delightful short trips of roads, along which we have been able to speed with enjoyment, and we have murmured grateful thanks to the surveyor and the responsible road authority. Then, with startling abruptness, we have found ourselves upon other stretches the bad condition of which has driven us almost wild with desperation, and we have called upon Heaven to deal out justice in the next world to men whom we cannot bring to book in this.

The Great North road runs through the areas of no less than seventy-two highway authorities, of which number forty-six are actually engaged in its maintenance, but all the seventy-two have some share in its administration. The Great North road should be widened gradually throughout its length to about 100 ft. to 120 ft. But this cannot be done at the present time. On the contrary, under the existing system, everything combines to make such widening, however necessary, as expensive and as difficult as possible. Houses are being erected, too, near the metalled carriage-way. The only restrictions are those imposed by the Public Health Act, and any building bye-laws that may be adopted by the various Urban and Rural District Councils. A general rule governing the Great North road and all other main roads should provide that no new buildings shall be erected within 60 ft. of the middle of the highway. This would permit of the road being gradually widened to 120 ft. without it being necessary to pull down any new buildings or to acquire, at the public cost, fresh land. Rules of this kind should be drawn up by a Central Department.

In conclusion, the chief lines of reform are: (1) The creation of a Central Highway Commission. The Lunacy Commissioners in some respects, the Light Railway Commissioners in others, are bodies which might be taken as examples of the kind of organisation required. Just as the former are instructed to secure the efficient administration of the lunacy laws and the proper maintenance of lunatic asylums, so the Highway Commissioners should be empowered and enabled to secure the efficient administration

* Extracts from paper read before the A.C.G.B.I. on the 12th inst.

of the Highway Acts and the maintenance of the roads in a condition adequate to the demands upon them. Again, just as the Light Railway Commissioners are instructed to encourage the provision of light railways, so would the Highway Commissioners be empowered and enabled to secure the provision of wider and better roads.

(2) The creation of a body of capitalists interested in roads by making it profitable to private capitalists to build new roads.

(3) The unification and simplification of the existing system of highway administration. What the Government has done for education it should do for highways, by making the county councils and the county boroughs (and, in certain districts, joint committees of these bodies) the responsible authorities for the condition of all the highways.

The future is in the hands of the A.C.G.B.I. Whether these reforms are carried through depends largely upon the Automobile Club. It alone is in a position to supply the driving force necessary to bring about these changes. It may succeed in engaging the help of other bodies, but it must organise and engineer the movement. Will it rise to the needs of the occasion? It is for you to say. Judging from its past history, I myself believe that the answer will be in the affirmative.

A SECOND ACQUITTAL.

ON November 16th, Alfred Gregson, Croydon, was riding a motor-bicycle on the Brighton road at Purley, with Mrs. Gregson riding behind in a trailer, when a pony and trap came into collision with the bicycle. The bicycle and trailer were smashed and Mr. Gregson was seriously injured. The driver of the pony trap drove off at once, leaving Mr. and Mrs. Gregson in the road, Mr. Gregson with a broken collar-bone and in an unconscious condition. At a recent sitting of the Croydon County Court Mr. Gregson claimed damages from Mr. Eli Marwood, a builder, of Godstone Road, Croydon, who was alleged to be the driver of the trap. Mr. Marwood denied this, and eventually His Honour gave judgment for the defendant. The matter was re-opened last week through an action brought by Mrs. Gregson against Mr. Marwood for damages for personal injuries received in the accident. After an exhaustive hearing his Honour gave judgment for the defendant again.

THE SALE OF A MOTOR-CAR.

BEFORE Mr. Justice Grantham and a special jury, Isidore Clifford sued Hewetsons (Limited) for the rescission of a contract to purchase a motor-car, or alternatively for damages for breaches of warranty on the sale of the car. The defendants denied that the plaintiff was entitled to rescind the contract or that there had been any breach of warranty, and they counterclaimed to recover £9 3s. 6d., the balance of the price of the car, and £62 10s. 3d. for other goods supplied. They also claimed to be entitled to 10s. a week for storing the machine since it had been returned to them by the plaintiff. The plaintiff's case was that on January 4th, 1902, he agreed to purchase from the defendants a 10-h.p. Benz car for £489 3s. 6d., and paid the sum of £480 on account of the price. Upon the occasion of the sale the defendants, according to the plaintiff, verbally warranted that the motor-car was properly built and constructed and was in good working order, and they guaranteed it for six months. The car, according to the plaintiff's case, was badly constructed in various particulars and never ran well, and was constantly in need of repair. Eventually, on June 8th, 1902, he returned it to the defendants and asked for a return of the £480 paid by him. The plaintiff, in giving evidence, said in November, 1901, he had a 10-h.p. Benz which he had bought from the defendants. He had had it five months and had driven it 10,000 miles, and the car was in every way satisfactory. The defendants asked him if he wished to sell the car, as they had a customer who was anxious to purchase such a car second-hand and was willing to pay the price of a new car for it. The defendants said that, if he would agree to this, he would be getting a new car for an old one. He eventually agreed to let them have his car, and chose in exchange, first of all, a 10-h.p. Charette car, which proved unsatisfactory; and the defendants then suggested that he should wait until a new 10-h.p. Benz tonneau car should come from the factory at Mannheim. When this came he was dissatisfied. On behalf of the defendants, witnesses were called to prove that the motor-car was properly built and constructed, and was in good order and free from defects when it was delivered to the plaintiff. Such defects as were apparent in the car on its return were, it was alleged, due to careless and rough treatment and negligent and improper management of the car by the plaintiff and his driver. Witnesses from the defendants' works also stated that the plaintiff was a faddist in regard to the car, and was in the habit of bringing it to the works for repairs when the latter were unnecessary. No evidence was given on the counter-claim, it being practically admitted by the plaintiff. Counsel having addressed the Court, his Lordship summed up the case to the jury, who returned a verdict for the plaintiff for £260 on the claim, and for the defendants for £89 on the counter-claim. Judgment was given accordingly for the plaintiff on the claim and for the defendants on the counter-claim, with costs to the successful party in each instance.

Application for a new trial is being made on behalf of the defendants.

FURIOUS DRIVING CASES.

COURT.	DEFENDANT.	ALLEGED SPEED.	RESULT.
Bishop's Stortford...	G. Marsh, London	—	£3, etc.
"	A. Crowder, Bow	—	£2, etc.
"	W. Lee, Forest Gate	—	£2.
Leeds	H. A. Routh, Leeds	18 m. p. h.	40s., etc.
Epsom	J. Overton	16½ m. p. h.	30s., etc.
Kingston	E. C. Muir, St. James's Place, W.	—	£2, etc.
"	F. Bircham, Woking	—	£2, etc.
Chelmsford ...	S. Galley, Stamford Hill	23 m. p. h.	£5.

Where no alleged speed is given it is understood to be above the legal limit.

SOME familiar names appear in our list of furious driving cases this week.

In the course of the case against Mr. E. Campbell Muir, at Kingston, an altercation occurred between the Chairman of the Bench and Mr. Stapleton Firth. Ultimately matters were smoothed over by the latter gentleman withdrawing unpleasant observations he had made.

AT Chelmsford, Sidney Galley, motor-car driver, of Stamford Hill, pleaded guilty to driving a motor-car at a greater speed than twelve miles an hour between Widford and Ingatstone. The Chairman of the Bench said:—"We have an invariable rule here—we fine everyone £5 and costs. You will have to pay that and 9s. 4d. costs, or in default, you will go to the house of correction for a month."

FRANCIS BIRCHAM, Beech Hill, Woking, was summoned at Kingston for driving his car at an excessive speed in the Portsmouth Road, Thames Ditton, on the 22nd ult. P.C. Mortimer said that the defendant covered a measured quarter of a mile in forty seconds. Defendant asked how the measurement had been taken, and was informed that it was with a chain. He admitted that he could not swear that he was not going over twelve miles an hour. He certainly did not think he was going at twenty-two miles as stated by the constable. The Chairman: Well, to save time, what speed will you plead guilty to? Defendant: I scarcely know. Eventually, as the offence was committed on a straight and clear road, the mitigated penalty of £2 including costs was imposed.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, MARCH 28, 1903.

[No. 212.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

NOW that the Exhibition of 1903 is closing the trade will settle down to deal with the orders received, and in many offices matters are straightening out for a busy season. To-day (Saturday) the great Show of 1903 will end, and the Agricultural Hall, which has been brilliant every evening with electric light and lively all the week with throngs of visitors, will soon resume its normal condition. Doubtless there will be a rush of visitors on the last day—the only opportunity now remaining for seeing this most comprehensive automobile display.

A Point for Drivers.

The paper by Mr. Kenneth Campbell, which we published recently, inaugurated a correspondence somewhat similar to that which ran through our columns in the early days of the *Journal*. We suppose the question of the annual upkeep of motor cars will be one of perennial interest, as it is of considerable importance to all automobilists. One point, however, is deserving of very serious attention, and that is the wages and emoluments which are paid to motor-car drivers employed by private owners. There is really no standard by which at present to judge as to what is the proper rate, and here the law of supply and demand must necessarily hold the key of the position for some time to come. At the present Exhibition several coachmen have been observed amongst the visitors prying over the chassis and the internal arrangements of motor-cars with a curiosity that would lead us to suspect they were desirous of becoming as well acquainted with the mechanically propelled vehicle as they are with the antics and the vagaries of the ordinary horse. It is evident that the average London man owning motor-cars prefers the coachman to the mechanic, the former invariably taking greater pride and care in the appearance of his vehicle. This is a point that mechanics and drivers should take note of, if they want to enjoy some of the good places that are opening up by the popularity of motoring among the aristocracy.

The Lords and the Race.

THE Light Locomotives (Ireland) Bill has again been the subject of discussion in the House of Lords, having passed through the committee stage last week. The Marquis of Granby had put down an amendment which would have had the effect of giving the County Councils the power to suspend traffic only on the main roads under their control. He thought that great inconvenience would result if the County Councils closed private roads as well; but upon representations being made to his lordship as to the dangers that might be caused if these by-roads were not closed, he consented to withdraw the suggestion. Lord Londonderry also had an amendment on the paper to transfer the power to make provision for temporary suspension and regulation of the traffic from the County Councils to the Local Government Board for Ireland. This amendment, which centralises control, is so obviously reasonable that it secured unanimous adoption in the House.

The Course.

Now that the Legalising Bill has passed through the Lords—that stage having been reached on Tuesday—interest in the Gordon Bennett race is transferred from Westminster to Ireland.

The course has just been shortened to 102½ miles (three and a half times round) and the contest will probably commence near Old Kilcullen at 7 a.m. on the morning of July 2nd. Everyone who has gone over the route seems well satisfied with the prospect, especially as some winding stretches have been eliminated and a deviation made from the original course by which Naas and Newbridge will be omitted from the itinerary. Controls will probably be established at Kildare, Carlow, Athy and Castledermot. The course includes about 250 miles of straight roads in stretches of 8 to 10 miles—and about 100 miles of “curly.” Some of the sharp corners are being removed, and two bridges are being levelled off so as to minimise the dangers. Messrs. Edge and Jarrott having been selected as two of the British champions, it only remains to be said that in the Eliminating contest Count Zborowski will drive a Napier car against the Star car which has just taken its first spin on the road.

The Napier Racer.

WE are this week able to give a few brief particulars of the racing car which Mr. S. F. Edge will drive in the race. The vehicle is very much on the lines of last year's winner; it is fitted with a four-cylinder engine said to develop 30-h.p. The ordinary high-tension system of ignition is employed, while the governor is adapted to act on the throttle. The water circulation is maintained by a friction-driven pump and Clarkson radiators. Four speeds forward and reverse motion are provided, the power on the top speed being transmitted direct, no secondary gear wheels whatever being in motion. Like last year's racer, the new car is provided with a live axle, power being transmitted from the gear box through a longitudinal universally-jointed shaft and bevel gearing. The frame is built of steel and wood, and the racing car complete weighs 17½ cwt. The road wheels are of equal size, 34 inches diameter, and shod with 90 mm. tyres, the wheel base being 7 ft. 10 in.

The Manchester Club.

LAST week the Manchester Automobile Club held its third annual dinner, about eighty gentlemen being present. Mr. F. Smith, President of the Club, presided, and among those who apologised for absence were the Duke of Westminster and Mr. Arthur Balfour. In the course of a speech, in proposing the toast of “Automobilism,” Mr. Smith mentioned that the Club now had a membership of 150, and he was glad to see that Mr. Galloway, upon whom they had recently passed a vote of censure, had ordered a motor-car. It was suggested that they should let bygones be bygones. Motorists were not wilful breakers of the law, but they naturally considered that the twelve miles an hour limit was absurd and ridiculous. They did not wish to monopolise the highway. Even the wagoner who was invariably found on the wrong side of the road, and the driver of the hooded van, who sat where he could not see either

to the left or right or behind him, should have consideration. The speakers included Mr. A. F. Bird, of Birmingham, Mr. G. Milner, Alderman Rudman, Mr. Henry Edmunds, and Col. Dickson, chairman of the Cheshire County Council. The latter gentleman expressed his sympathy with automobilists in their desire for the speed limit to be done away with. In time he thought separate tracks might be provided for the use of automobilists.

A Gloucester Automobile Club.

At a representative meeting held at the Queen's Hotel, Cheltenham, on Monday, the 16th inst., a motor club was formed for the county of Gloucester, with Cheltenham as headquarters, under the title of "The Cheltenham and County of Gloucester Automobile Club." The Club has a very promising outlook, there being a large number of motorists in the county. Full particulars can be obtained from the secretary, Mr. H. Dyer, Juniper Cottage, St. Marks, Cheltenham.

"In Heaven's name, Policeman, come and bring my husband from the public-house."
 "Go away, you silly woman. Don't you see a motor-car approaching without a number?"
(Das Schnauferl, Munich.)

Control of the Highways.

THE President of the Local Government Board has just appointed a Departmental Committee to inquire into the general condition and sufficiency of the roads of England and Wales. This is asked to report whether any, and if so, what, amendment of the law relating to these matters or its administration is desirable in view of the various purposes for which the roads now are, or shortly may be, utilised, and particularly whether any change of the authorities who have control over the roads or of their powers is required. Among those on the committee are the Hon. A. Stanley, M.P., the Hon. J. Scott-Montagu, M.P., Mr. W. J. Bull, M.P., Mr. E. R. Pickmere (Town Clerk of Liverpool), Mr. G. C. Kent (Town Clerk of Longton), and Mr. S. Woodbridge (Clerk to the Brentford Urban District Council). Mr. R. G. Duff, of the Local Government Board, will act as secretary to the committee, the deliberations of which will be awaited with considerable interest by motorists.

"B. P." goes a-motoring.

THE other day Major-General Baden-Powell took a trip in Mr. Frederick Harrison's 12-h.p. car, travelling from London to Aldershot via Staines and Bagshot. On the return they proceeded by way of the Hog's Back to Guildford, and thence to Putney. A halt was made on the bridge to see the practice of the University crews in the boat race. This was the first motor-car ride the General has had since his return from South Africa.

Tare Limit of Motor Wagons.

THE Association of Chambers of Commerce has adopted a resolution "that in order to meet the urgent wants of the commercial, trading, and agricultural communities of the country in the matter of facilitating the carriage of merchandise and agricultural produce in motor-wagons, the tare limit now fixed for such vehicles should be raised without delay; and, further, owing to the importance of the interests concerned, this Association recommends that a deputation should be appointed to wait upon the President of the Local Government Board with a request that he will take the steps necessary to give effect to the recommendations contained in the first part of this resolution."

A Dismissal in Sussex.

AT length the magistrates of Arundel have seen fit to dismiss a charge of alleged furious driving against an automobilist, and a severe cross-examination by Mr. Staplee Firth was a strong contributory factor in the result. The police had measured a distance of one third of a mile, and with the aid of stop watches had formed their conclusions as to the actual speed at which the motorist was travelling. A driver of a horse who saw the car travelling through the town expressed the opinion that it had covered the measured distance in two or three seconds. Mr. Firth seized upon the point with his usual legal celerity, and having bound the witness to his statement as to covering the distance in three seconds, gravely calculated, for the benefit of the court, that this worked out to about 400 miles an hour. No wonder the chairman of the Bench remarked that there was some difficulty in deciding in this instance, as the police had only estimated the speed at 18 or 19 miles an hour, and when their witnesses came forward to make such alarming declarations the only course that remained for the Bench was to dismiss the case—a result upon which Mr. Firth is to be congratulated.

Novelists and the Motor-Car.

THE value of automobilism in freshening jaded nerves and reviving dull memories has been frequently urged by leading literary men. Among doctors Sir Henry Thompson has advised the motor-car as an aid to good health. Mr. Rudyard Kipling is a devotee of the automobile, Mr. J. M. Barrie is a recent convert, and now comes the news that Sir Arthur Conan Doyle has become the owner of a Wolseley car. Only a few days ago Mr. Rider Haggard reiterated his belief in the value of the automobile to the agricultural industry, and Mrs. Edward Kennard has frequently testified in our columns to the welcome change from other sports that automobilism provides.

The Speed Limit.

THE Northamptonshire County Council has again been discussing the subject of motor cars, and upon the resolution of its Finance Committee has agreed that the attention of the president of the Local Government Board should be drawn to the speed at which automobiles are driven. They suggest that the limits as to speed should be removed, that identification should be provided for by day and by night, and that the limit of penalties for breach of the law should be raised. In the

course of the discussion, Earl Spencer thought that the present limit of speed could not be enforced, and the fact that the motor was driven furiously and at a dangerous pace was the principal element to be considered. If a practical and suitable scheme of identification could be provided it would be an advantage, but he expressed a doubt whether they could identify cars which belonged to any part of the country. Ultimately the resolution was adopted, with the addition that the penalty for breaches of the law should be increased, and that there should be "alternative imprisonment" with the option of a fine. Evidently some members of the Northamptonshire Council have been taking the hint given by Earl Russell in our recent interview, and imprisonment may yet be added to the other delights associated with automobilism.

In the Peak District.

NOT the least important advantage rightly claimed for the motor-car is that it will relieve horses of many of their burdens. We have often watched animals straining every muscle to draw a heavy load up an incline, and their sufferings were plainly apparent. In many holiday-making

Motor Ambulances.

It is reported that the Metropolitan Asylums Board will shortly have a motor ambulance for the conveyance of fever patients. There ought to be little difficulty in developing the idea beyond fever patients and in installing similar machines at all the ambulance stations. Horses are too expensive to keep standing in connection with ambulance work, but the provision of motors for the purpose will prove an economical and serviceable innovation that should be carried out without difficulty or great expense.

A Daimler Dinner.

A DINNER was given by the Chairman and Directors of the Daimler Motor Company at the Trocadero Restaurant, London, to a large and representative gathering of the Company's agents on Tuesday evening. An excellent dinner was followed by an interesting programme. In the unavoidable absence of the chairman of the company, Sir Edward Jenkinson, the chair was occupied by Captain Longridge, who, with Mr. Ernest Instone, the manager of the company, was able to hold out a flattering prospect for prompt deliveries of 1903 cars.

(photo by) The Meeting of the Eastern Section of the Scottish A.C. at the Home of the Rt. Hon. Sir J. H. A. Macdonald, K.C.B. (Mrs. Norman D. Macdonald.

districts, too, such hardships have to be borne by horses, and hence we welcome anything that leads to the substitution of the automobile for the horse in such places. Recently a conference of the local authorities of the Peak district was held at Bakewell, when it was decided to propose a scheme of uniform bye-laws for the whole of the district, and so prevent the overloading of animals, which has, unfortunately, been a feature of the excursion traffic of the locality. Why not go further and suggest the encouragement of motor-car services?

Automobile Nescience.

IN making inquiries as to the different varieties of motor-cars many of our correspondents display a nescience that is almost amusing. The other day a correspondent in the Midlands wrote saying he wanted a motor-car to cost not more than £70, and which could be run at a weekly expense of not more than 7s. or 8s. including depreciation through wear and tear. He wanted to run about 2,000 miles per annum in ordinary daily work, supplemented by 500 miles during the summer holiday. Having regard to the expense associated with the horse and carriage, such queries occasion much amusement.

Mr. Mecredy gave a most amusing account of his experience in connection with the preparations for the Gordon Bennett Cup Race, and promised the warmest of welcomes to all who should cross the Channel to view that historic contest. The keynote of a most pleasant evening's entertainment was one of harmony and friendliness, together with anticipation of the increased prosperity of all connected with this leading firm. A number of faces well known in the motor-car industry were to be noticed among the company.

In New Zealand.

ALREADY the British Colonies are beginning to appreciate the advent of the motor-car, and the first cars to arrive to the order of the New Zealand Motor Company, Limited, of Wellington, were received lately. Their appearance in the streets naturally drew the public gaze, and the company's depot was besieged by spectators, who showed an eagerness to see, if not to buy. One of the first members of the New Zealand Parliament to become a motorist is Mr. Barber, member for Newtown. He should form the nucleus of a strong Colonial Automobile Party.

BIG GAME HUNTING IN THE ROCKIES.

By W. S. MONTGOMERY.

SHOULD hunting big game in an automobile ever become popular Mr. W. W. Price, of Colorado Springs, may justly claim to be the pioneer in that kind of sport. Quite recently, accompanied by Dr. C. E. Smith, he took his Winton touring car from Colorado Springs to Meeker, Col., via Ute Pass, South Park, Buena Vista, Leadville, Red Cliff, Glenwood Springs and Newcastle, where they picked up Mr. Lewis Lindahl, of Denver. From Newcastle the journey was continued to Rifle, and thence over the old stage road to Meeker, where the writer became connected with the trip.

Several days were pleasantly occupied in hunting deer in the "Flat Top" country, the party afterwards returning to Thirteen Mile Creek, making headquarters for three days at one of the cow camps. The deer were crossing in large numbers just at that time, and the hunters succeeded, without much difficulty, in getting plenty of game. As the party was bowling rapidly along a few miles out of Meeker, a band of deer attempted to cross the road ahead of the touring car. Mr. Lindahl, who was at the wheel at the time, put on more speed to head them off, and as pretty a race ensued as one could wish to see. The deer seemed determined to cross ahead of the machine, but the pace was much faster than they had calculated upon. They turned slightly and ran with the car for a considerable distance, and then, evidently much surprised, stopped and looked on in amazement as the car sped by. They were within easy gunshot, but, of course, none of the party thought of molesting them.

Had an air-ship dropped down in their midst, the astonishment of the natives could not have been greater. No automobile had ever been seen on either the Grand or White rivers before, and there were those who evidently had never heard of a horseless carriage. Upon entering a small town, the car was instantly surrounded by a great crowd of curious people, who plied us with so many questions that we were glad to pull out for the next village.

Starting on the homeward journey, with four of us and two saddles of venison on the car, we left the ranch at Thirteen Mile Creek at three o'clock in the afternoon, and arrived at Rifle shortly after five. The road was in excellent condition. From the top of the hill to Grand River is a slight grade, enabling us to coast most of the way. The road between Newcastle and Glenwood is extremely difficult, especially on a dark night. We wended our way up and down grades that seemed almost perpendicular. Because of the narrow winding roads in the cañon it was impossible to see more than a dozen feet ahead of the car. Luckily we did not meet any teams; for if we had, one or the other would have been compelled to back out of the cañon, as there was no room to pass.

The attractions at Glenwood Springs were so alluring that it was not until the afternoon of the following day that we left there. As we slowly picked our way over the half finished State road through the Grand River cañon, we all agreed it was the most interesting part of the journey. There are those (and the writer is one of them) who pronounce the Grand River cañon the most beautiful in Colorado. It cannot, however, be appreciated to the fullest extent in passing through by rail. For miles the chasm is cut through layers of limestone of more or less regularity, the perpendicular walls being brilliantly coloured from the effects

of iron and other mineral stains. At times the walls appear to come together and further progress seems impossible, but, by the expenditure of much money and nitro-glycerine, the new State road has been blasted out, and may some day be fairly passable for other vehicles than a petrol motor-car. A considerable portion of the road has not yet been surfaced with earth, and the sharp edges of rock were especially trying to the tyres, but fortunately no punctures or other mishaps occurred, although several times the rear wheels spun round, skidding towards the edge at the same time.

There were not more than a dozen places in the whole canon where teams could be passed. Only one was encountered, and this happened to be near one of these places. The driver had to unhitch and lead the horses by, we taking the outer edge of the road, as we were not afraid of our horses jumping off.

Passing through an extinct volcano district, we were soon in Wolcott. The run up the Eagle, through the town of Eagle to Minturn, was quickly made. The roads were excellent, and the morning air, while bracing, was not too cold for comfort. And then came one of the most difficult parts of the trip, up over Battle Mountain. So steep was the gradient that we all had to get out and walk, with the exception of Mr. Price, who was driving. We took a straight cut up the mountain side, arriving

at the summit some time before the car, which had to follow the zig-zag trail. One can form some idea of the fearful gradient the Winton car went up, when it is mentioned that the rugs and some of the other loose articles lying on the tonneau floor slid out over the rear door.

Passing through Gilman and down into Red Cliff, the slopes were very steep and there was always the danger of meeting teams as we rounded the dangerous curves. To avoid accident, one of the party usually ran ahead, and thus, while our progress was necessarily slow, it was without mishap. Above Red Cliff the wagon road follows the abandoned narrow gauge railroad track. And then came the ascent of Tennessee Pass, the great Continental Divide, where was gained an altitude of 11,500 feet, the highest point of the trip. The water that drains off on one side flows into the Pacific, and on the other into the Gulf of Mexico.

We intended making the trip through from Leadville to Colorado Springs, 160 miles, the next day. The run was made in excellent time to Granite and Buena Vista, over Buena Vista Pass and across South Park to Hartzell, where we arrived in the middle of the afternoon, in ample time to reach the Springs that evening, if all went well. As we were leaving Hartzell one of the rear tyres, the covering of which had been threatening to go to pieces for several days, collapsed completely. It took an hour to replace it, and in the meantime snow began, and the wind blew furiously from the east. A blizzard was upon us, and we were compelled to return to Hartzell for the night. An early start was made next morning, and shortly after noon we were at home in the Springs. About 750 miles were covered, mostly over mountain passes and through almost impregnable canons, at an average running speed of fourteen miles an hour. It proved that hunting big game in the Rockies may be done in an automobile. Although it may be a precarious undertaking, there is just enough excitement about it to make it a real pleasure for most men.

PRINCE LOUIS OF BATTENBERG has ordered a motor-car from the Wolseley Co. which has four orders in hand for the 50-h.p. racing cars now building for this year's races.

The Spoils of the Chase.

Big Game Hunting in the Rockies.

Snapshots of a Winton Car among the Mountains.

CONTINENTAL NOTES.

BY "AUTOMAN."

MID-LENT Thursday is a general holiday in Paris, when King Carnival takes possession of the city, stopping the traffic, bringing out the sightseers, and giving occupation to hundreds of poor people by the sale of confetti which, by night time, constitutes a multi-coloured carpet three or four inches deep along the boulevards from side to side for miles. Mid-Lent is the holiday of the washerwomen and of the markets, and each great institution selects a Queen, the united committees choosing from amongst the Queens a Queen of Queens, who presides over the carnival. The chief feature of the fete is a procession through the principal streets and a visit to the Elysee Palace, where the Queen of Queens is received by the President.

THE triumphal cars have from time immemorial been drawn by horses, but this year the Queen of Queens dispensed with animal traction, and replaced it by a self-propelled vehicle.

The Mi-Careme Carnival—The Car of the Queen of Queens.

Strange to say, this year's Queens of Queens is employed in a *boucherie hippophage*. I will not offend the delicate tastes of the readers of the *Journal* by translating this technical term, but will leave it to their imaginations. Fate, however, played a spiteful trick on automobilism, and on the sovereign lady, for the electric car which was provided to carry her in triumph was a victim to *la facheuse panne*, and had to be ignominiously pushed by the assistants and finally dragged by a friendly petrol car.

AMONGST the visits made by the Queen of Queens was one to the A.C.F., where there was a reception in her honour. A great many members gathered in and about the club at the hour of her promised visit, but it was not until nearly two hours later that the triumphal car turned the corner of the Rue Royale and drew up before the Hôtel Pastoret.

AT the 1901 Paris Salon there was in the side gallery a little stand with one car on it, the invention of M. Megy. I gave in

these columns a description of this ingenious car, with its automatic change of speed gear. The other day I was invited to inspect the car in operation, and the results were so interesting that no excuse is necessary for referring to them here. Let us suppose, then, that we are about to take a run in the Megy car, that the motor has been started, and the driver has taken his seat behind the steering wheel, which is the only piece of mechanism in view, there being no change-speed levers or pedals of any description whatever except a foot brake, which is never used, but which the law requires. There is, however, a dial on the dash-board with a needle which points to one of four speeds. In order to start the car, the driver presses the steering wheel forward, and off we go on the first speed. As soon, however, as the motor begins to race, we hear a click and the needle on the dial shows that we have automatically changed on to the second speed; again the motor races, another click, and we are on our third, and then on our fourth. By this time we have reached a steep hill, and the motor begins to slow down, when—click—we are on our third; the hill gets steeper, the motor begins to slow down more; in goes the second speed, and afterwards the first. Once on the brow of the hill the speeds go in automatically again. As we are going down hill, however, and do not desire to go too quickly, the driver pulls the steering wheel towards himself and brings in gear the speed he requires, the needle always indicating it. Half-way down the hill we come to a restive horse, a rare thing to find in France, the driver considers it wise to stop, and has only to pull the steering wheel a little further, which puts on the brake. The restive horse, however, will not face the motor-car, and the driver pulls the steering wheel again, when the car backs up the hill. After seeing these wonderful evolutions, and to convince myself, I asked if I might take the steering wheel. Consent having been given, I took the helm and went some miles up and down hill, backwards and forwards, with the greatest facility.

THE operation of the automatic change-speed gear is not very complicated, and is worked by the well-known "servo-motor" movement. Each of the speed gears is always in mesh with its corresponding pinion on the driving shaft, but a clutch on the "Megy" principle makes any one of the four speed pinions solid with its shafts. These clutches are worked by a governor and a double ratchet, with which the "servo-motor" engages whenever the speed of the motor rises much above or much below the normal. An increase of speed engages one ratchet, and a decrease the other, and so regulates the position of a shaft, which actuates successively the four clutches, working the different speeds. The steering wheel when pushed forward engages the main clutch, and when pulled backward brings the reverse motion into gear. The car is very crude in construction, but an up-to-date model is being made, with a two or four-cylinder vertical motor placed in front with all the latest features of the 1903 automobile.

ON the occasion of the Automobile Congress which the A.C.F. is organising there will be three gala days. The French Club has voted a sum of £2,000 for the purpose. The fêtes will include a gala performance at the Opera, which has been hired exclusively by the Club; a dinner for 200 people in the theatre belonging to the A.C.F. at the Place de la Concorde, and a monster excursion to the forest of Fontainebleau. It is a programme worthy of the A.C.F.

THE latest news from Cannstatt is that none of the 90-h.p. Mercedes racers will take part in the Nice Week. The fleet of 90-h.p. cars are being reserved for Paris-Madrid, and will be driven by Count Zborowski, Baron Forest, and M. Degrais. At Nice there will be six of the new 60-h.p. cars, driven respectively by Baron de Caters, and Messrs. Degrais, Werner, Max, Hieronymous, and Gasteaux.

THE following item of news in last Sunday's *Velo* is, I think, worthy of reproduction in the original:—"L'Automobile Club d'Angleterre tient actuellement son Exposition à Londres, et les sportsmen et chauffeurs anglais ont insisté si fortement auprès

du commissaire général, que celui-ci a demandé à la maison Charron, Girardot et Voigt de vouloir bien lui envoyer la nouvelle voiture 40 chevaux huit cylindres, qui s'est révélée comme le dernier mot de la perfection. M. Voigt est parti par la route pour Londres, où il présentera le nouveau modèle aux amateurs."

At the meeting of the *Chambre Syndicale du Cycle et de l'Automobile* in Paris last week a resolution was adopted protesting against the way the Sporting Committee of the A.C.F. has selected the French team to compete for the Gordon Bennett Cup.

ON July 19th there will be a motor-car race in France organised by the *Chambre Syndicale de l'Automobile*. It is to be called the "Circuit de l'Argonne," and it will take place in the east of France, between Sedan and Vouziers, on a circular course where there will be absolutely no neutralised ground. There will be two distinct sets of classifications—the one being the familiar classification by weight, divided into the usual four categories of 50, 400, 650, and 1,000 kilos, and the second will be an entirely new classification, namely, by the cubical contents of the cylinders. For this class

soon have to be established to which reference can be made. All automobilists know the weight of the decisions of the A.C.F. or the A.C.G.B.I., and they probably are aware that the A.G.A. are putting up danger signals all over France on the roads. Some few who are international know of the D.A.C. or the A.C.B., the A.C.S. or the O.A.C., but when it comes to the local clubs in France, such as the A.C.N., or the C.A.O., matters become a little more complicated, whereas if we leave the automobile and go on to the bicycle, we find ourselves lost in contemplation of the meaning of U.S.F.S.A. and F.C.A.F., only to cite one-hundredth part of the clubs and associations.

A PARISIAN electrical engineer—M. E. Zay—has lately introduced a new circuit interrupter plug, so designed that only the driver of a motor-car or the rider of a motor-cycle may complete the ignition circuit. As is well known, a small piece of brass is frequently used for this purpose, but now that motor-cars and cycles are becoming so numerous greater care is necessary to prevent one's possessions being stolen when left unattended. The new interrupter is made on the principle of the combination letter lock, with which all are familiar. The female part of the interrupter is of special construction to correspond with the plug,

The Peugeot Petrol Lorry—The Winner of the Industrial Section (over 1 ton) of the "Poule des Vainqueurs" (See last issue).

[Le Chauffeur.

the competing cars will be divided into five groups, namely, $1\frac{1}{2}$ litres, $2\frac{1}{2}$ litres, $3\frac{1}{2}$ litres, 5 litres, and 7 litres. All the competing cars must have four wheels and two seats side by side. The entrance fees will be—for the 50 kilo. vehicles, 100 francs; for the 400, 200 francs; for the 650, 300 francs; and for the 1,000 kilos, 400 francs; whilst the five subdivisions of the second category will have to pay 200 francs each for the $1\frac{1}{2}$ and $2\frac{1}{2}$ litre cars, and 300 francs for the others. Entries with a single fee close June 15th, and with a double fee July 11th, and the entries received on or before April 16th will have the advantage of balloting for starting-places; the rest will start in their turns. Entries should be addressed to the treasurer, M. Lemoine, 21, Rue de Lappe, Paris.

In one of the principal music-halls in Paris, in what is entitled the *revue*—that is to say, a sort of pantomime, where local and national events of the day are made fun of and pass in review before the spectator—a great deal of merriment is made out of the letters representing the names of the legions of sporting clubs which are now becoming so common all over the world, owing chiefly to the bicycle and automobile trades. Indeed, it is getting so confusing nowadays that a special directory will

the latter consisting of four discs on a central stem. The discs can be rotated, and bear on their periphery a series of letters. A great variety of combinations can be made, but the circuit cannot be completed until the discs are set in such a position as to give the proper combination of four letters, known only to the owner.

MESSRS. SCAIFE AND PEARSON are opening the City and County Garage, at 13, Stonegate, York.

SOME M.P.'s are urging upon their colleagues that they may do a good turn to British industry by supporting the adoption of benzol in place of petrol for the propulsion of motor-cars.

THE Hozier Engineering Company, Limited, have added considerably to their machine tool plant in order to give a reasonably early delivery to purchasers at the Motor Car Exhibition at the Agricultural Hall, London.

THE Imperial Motor and Cycle Repairing Works at Lyndhurst are erecting a new garage, the only one in the neighbourhood, and are undertaking the purchase and sale of cars. They have recently had lamps put up at the important cross roads in the district lighting motorists to their works.

MOTOR-CYCLING NEWS.

THE motor-cycle club which has just been formed in Paris is to be known as La Société d'Encouragement du Moto-cycle.

AMONG the races at the meeting to be held on the Putney track on Easter Monday is a five miles scratch motor-bicycle race. Machines with engines up to 3-h.p. will be allowed to compete.

WITH reference to the decision of the Sussex centre of the National Cyclists' Union as to motor-racing given in last week's issue we would point out that the result of the deliberations was arrived at in error. All motor-racing is in the hands of the Automobile Club, who will appoint handicappers for all contests.

THE annual meeting of the Motor Cycle Union of Ireland (Dublin centre) will be held in the Red Bank, D'Olier Street, Dublin, on the 7th prox. Mr. M. A. Wheeler will propose, and Mr. J. B. Dunlop will second, a resolution making the fees for membership of the Motor Cycle Union of Ireland as follows:— Entrance fee, 10s.; annual subscription, 10s.

Filling up the Petrol Tank.

(Automobil Welt.)

MR. C. H. OLIVERSON writes:—I have noticed the correspondence lately with regard to the efficiency of surface and spray carburettors. I have an Ariel 3 1-8-h.p. tricycle which weighs 3 cwt., and I have done 105 miles with one gallon of petrol. I myself weigh over 1½ cwt. The above is with a surface carburettor which has never yet given the slightest trouble during 11,000 to 12,000 miles. I have also driven a Benz Ideal several thousands of miles with surface carburettor. It has flooded once, but not owing to any fault of the carburettor. I can use up every drop of petrol in the carburettor, and the motor runs over 40 miles, with one gallon, carrying two persons."

A MEETING is to be held in Glasgow on Friday, April 3rd, to consider the question of forming a Glasgow Motor Cycle Club. Owners and prospective owners of motor-cycles are invited to attend.

PRIOR to 1902 the imports and exports of motor-cycles and motor-cycle parts were included in the Board of Trade returns with the figures relating to ordinary cycles. Beginning with 1902 a change was made, motor-cycles being separated from cycles but included with motor-cars, a case of jumping "from the frying pan into the fire," so far as rendering it possible for any one to ascertain the foreign trade that is being done in motor-cycles. With the view of increasing the usefulness of the monthly returns so far as the automobile industry is concerned, we recently addressed a letter to the Board of Trade on the subject, and now publish a copy of the reply received:—

"I am directed by the Board of Trade to acknowledge the

receipt of your letter of the 26th ultimo, suggesting that the imports and exports of motor-cars should be shown separately from those of motor-cycles in the official trade accounts. In reply, I am to state that the form and scope of the accounts to be issued for the present year have for some time been definitely fixed and cannot now be altered, but that your suggestion will be referred to the Departmental Committee for the Revision of the Trade Accounts for consideration at their next annual meeting, which will take place during the autumn."

THE Coventry Chain Company have lately introduced the flexible belt hook for motor-bicycles illustrated herewith. The four

hooks work on a common fulcrum (a bearing having a hardened rivet) when passing over the small pulley. Each hook is in alignment, so that they support one another, and give a direct pull only. The pitch of the hooks coincides with the distance of the copper rivets generally found on V shaped belts. It therefore follows that to fit the hook all that is needed is to drive out two copper rivets from each end of the belt and insert the hook. It requires no driving in, or bending over on the under side. Even though the holes be large ones, it is claimed the hooks keep in place by the belt tension, and will not tear the leather. The belt hook is to be seen at the Motor Car Exhibition.

HEREWITH we illustrate, in section, the new throttle valve for use in connection with the spray-type of carburettor which the E. M. Bowden's Patents Syndicate, Limited, have lately put on the market. The valve is actuated by Bowden wire mechanism and a twist handle, the latter enabling the rider to regulate the throttle to such a nicety that the motor can be cut down to its slowest speed almost instantaneously. The valve can also be actuated by a ratchet or friction lever, but the makers recommend the twist handle, it being more delicate of adjustment, and always in the hand of the rider, so giving complete control. The valve is being made in two patterns. Fig. 1 shows the straight-through pattern, the hollow piston being drawn up by the Bowden wire against the spiral spring inside the throttle, gradually cutting off the area of the induction pipe till quite closed. Fig.

Fig. 1.

Fig. 2.

2 represents the right angle pattern. In this case the gas passes through the hollow piston, which, as in the other type, is drawn up by the wire against the internal spring, so closing the induction pipe.

HERE AND THERE.

MR. J. M. BARRIE is now among the novelists who own motor-vehicles.

THE German Automobile Club is organising a tour from Berlin to Paris for June next.

THE Western Road Carrying Company, of Bristol, has twenty motor vehicles on order.

MR. T. C. AVELING has been elected hon. secretary of the Midland Automobile Club.

THE Standard Motor Company, Limited, has been registered with a capital of £5,000. The office is at 37, Earl Street, Coventry.

MR. B. C. SELLARS, an enthusiastic Manchester motorist, has been placed on the commission of the peace for the county of Lancaster.

THE Triumph Cycle Co., Limited, Coventry, have just issued a handsome new show card illustrating the Triumph cycles and Triumph-Cottareau motor-cars.

THE Calcutta Port Commissioners have agreed that a depot for the storage of petroleum spirit may be established at Moyapur, below Budge Bridge, near the city.

THE British Motor Tyre Syndicate, Limited, has been registered with a capital of £50,000. The registered office is at Northern Assurance Buildings, Albert Square, Manchester.

THE Norwich Corporation have just put in service a steam motor-vehicle designed for dust collecting and street watering purposes. It was built by the Yorkshire Patent Steam Wagon Company, of Leeds.

A MOTOR-CAR service will be run on Friday, Saturday and Sunday during the season from the Savoy and Claridge's Hotels, calling at the Naval and Military Club, Piccadilly, to the Naval and Military River Club, Maidenhead, the fare each way being 5s

THE 40-h.p. 8-cylinder C.G.V. car, to which we referred in our last issue as having been put through its trials at Long-champs, Paris, has been in London this week, it having been on view at the London depot of Messrs. Ewart-Hall, Limited, prior to its despatch to the Agricultural Hall Exhibition on Wednesday.

MR. THOMAS SYLVESTER died at Ashford, on Monday, from the effects of a motor-cycle accident. He was descending a hill on the Canterbury Road when a dog ran across the road and the machine went over the animal. Mr. Sylvester was dashed violently to the ground and death resulted from his injuries.

IN the photograph of the visit of the Eastern Section of the Scottish Automobile Club to Coll-Earn, Auchterarder, N.B., on page 55 Mr. Norman D. Macdonald, the Chairman of the Club, is seen with his hand on the lever of Mr. Stirling's car. His daughter is on the car, with Mr. George Macmillan, the secretary, and his boy, in Highland dress, is with Mr. Cox, of Snaigow.

THE Wolseley Tool and Motor-Car Company, Limited, have received an order from the North-Eastern Railway Company to supply two Wolseley horizontal four-cylinder petrol engines developing about 95-b.h.p. These are to be used in their petrol-electric automotor railway carriages which are to run between the two Hartlepoons and are to replace the existing vertical engines. The performance of these two engines will be watched with great interest by all makers of petrol motors.

THE Earl of Mayo, in the House of Lords, has asked his Majesty's Government, in view of the increasing number of small steam boilers in use in motor-vehicles, lorries, &c., what system of inspection was adopted with regard to these boilers. Lord Wolverton, who replied, said that neither the Board of Trade nor the Local Government Board had power to require an inspection of steam-boilers in automobiles, but in the event of an explosion the Board of Trade had power to order a preliminary inquiry.

THE Lord Lieutenant of Ireland has been motoring in North Wales.

LORD CADOGAN, the Ex-Lieutenant of Ireland, is the owner of a 24-h.p. Napier car.

AT an auction sale to be held at Louth on the 3rd prox., several motor-cars and cycles will be included.

MR. D. E. CAMPBELL has opened the Northern Counties' Automobile Garage in Pilgrim Street, Newcastle.

MESSRS. LORAIN, Barrow, Stead, Gras, and Jarrott will each drive 60-h.p. De Dietrich cars in the Paris-Madrid race.

CAPTAIN SHOWERS, Chief Constable of Essex, has employed a motor-car in his visits of enquiry in connection with the mystery of the Moat Farm, Clavering.

To get quickly to a fire which had broken out in a Leamington school during school hours, the fire brigade had their engine drawn by a motor-car instead of horses.

FROM the Packard Motor Car Company, of Warren, Ohio, U.S.A., comes an elaborate catalogue, in which the latest type of Packard 12-h.p. car is exhaustively described.

THE title of Mr. Radford Cooke, the chief clerk to the A.C.G.B.I., is to be the "Assistant Secretary" in future. Mr. F. Straight is the assistant secretary for motor cycling matters.

A GERMAN concern has lately introduced the novel face shields for motorists illustrated herewith, protecting the eyes, nose, and mouth from cutting wind, rain, and dust. It consists of a thin window of mica set in a light aluminium frame, that for

ladies' use being combined with a veil. The shield is held in position by wires extending behind the ears, and a central wire with forked ends to clip the bridge of the nose. The "Mica" face shields can be obtained in this country from Mr. Henry Waterson, of Aston, Birmingham.

SPEAKING at a Romford Cricket Club dinner, Col. Lyon, V.D., alluding to the interest taken by the chairman, Mr. L. Sinclair, M.P., in motoring, said he thought motor-cars would be of great assistance in the defence of the country—a view that has become universal among military authorities.

A NEW garage is about to be opened by Mr. Walter Scott at 109, Goldhurst Terrace, Finchley Road, N.W., with accommodation for forty cars. A stock of petrol, oils, greases, and spare parts for all the well-known makes will be kept, while there are facilities for carrying out all classes of repair work.

THE Hart Accumulator Company, Limited, have just issued a new leaflet, giving particulars of the Hart cells specially manufactured for motor-car ignition work. They can be supplied either singly or in two or three compartment cases, which may be of ebonite or celluloid, and are made in sizes from 9 up to 90 ampere-hour capacity.

THE motor fire engine recently installed at Whitefriars Station, in Carmelite Street, E.C., has been sent back to headquarters for repairs.

MR. WALTER LONG's assurance as to the introduction of motor-car legislation—given to Dr. Farquharson in the House of Commons on Monday—depends on it "being found practicable"—a condition of things which Mr. Arthur Balfour does not consider likely to occur.

EXHIBITION ECHO.

SUCH an imposing collection of heavy steam vehicles has never before been seen at an Exhibition. That in this branch of the automobile industry England is maintaining its position cannot be questioned. Although most of the firms showing will be full up with orders for some time to come, they have deemed it wise to keep their productions to the front, and the absence of only one builder of such vehicles has been much commented upon.

AMONG the visitors to the Show on the opening day were Sir Francis and Lady Jeune, who, we understand, have placed an order for one of the latest types of 20-h.p. M.M.C. cars.

LE PASSE PARTOUT, lying amid a collection of boxes and packing cases in the yard, presents a woebegone picture, and has caused many amusing comments during the week. Certainly it may be regarded as an "awful example" of fallen greatness, despite the presence at the rear of the vehicle of the Russian official Number 31.

NEVER before has the interest of the Press been so pronounced in an English automobile show. All day on Saturday there was a constant stream of representatives of the leading daily and Sunday journals, while the lengthy reports in the evening papers testified to the position these annual displays have attained in the estimation of those who reflect public opinion.

A Relic of the Pre-Motor Days.

ONE of the features of the Upper Street, Islington, during the Show has been the long string of carriages—both self-propelled and horse drawn, which has been seen on either side of the wide thoroughfare. Every afternoon there has been a large influx of visitors from the West End—a feature of the attendance highly gratifying to the exhibitors.

THE Gallery is now recognised as an important section of the Exhibition, and not only is the display of accessories representative and important, but the collection of cars is equally interesting.

REPRESENTATIVES of some of the firms who were late in applying for space have been seen in the Hall on every day during the Show, and many have taken time by the forelock by intimating their desire to book space for the 1904 Exhibition.

COPIES of the catalogue can be obtained from the office of the *Journal*, 39-40, Shoe Lane, London, E.C., price 6d., post free 1s. To those at a distance who have been unable to visit the Exhibition the catalogue will be useful as giving an idea of the comprehensive nature of the display.

BEYOND the shadow of a doubt the Exhibition will rank among the most successful events held in any country—not excepting France itself. Year by year the official catalogue has, with the number of exhibits and the importance of the Show generally, steadily increased in bulk, and now comprises no fewer than 180 pages.

APPROPRIATELY enough for this year Irish frieze seems to be becoming increasingly popular among motorists, judging by its prominence on the tailors' stands at the Exhibition.

ALTHOUGH the Hans Motor Mower was not ready in time for the Show, demonstrations of its capacity are to be made during the next few days at Lord's, the Oval, Kew Gardens, and one of the metropolitan parks, the latter by permission of the London County Council.

MR. ERNEST OWERS has ordered an 80-h.p. racing car from Messrs. Weller Bros. in anticipation of next year's Gordon Bennett race. A notice to this effect on the firm's stand on Wednesday attracted much attention.

DURING the Show the Post Office has been kept busy with telegrams both inwards and outwards. About four o'clock on Tuesday afternoon one arrived from A. Chase, at Doncaster. He had started from London in the morning and reached the sporting town after a non-stop run of 161 miles on an 8-h.p. single cylinder M.M.C. car—a good feat for a vehicle of that power.

AN event of much interest at the show on Wednesday was the appearance of the new eight-cylinder 40-h.p. C.G.V. car on the stand of the Great Central Garage, Limited. The object of multiplication of cylinders is to produce perfect balance of the engine, noiseless running, and great flexibility of control. The car is not fitted with any mechanical change-speed gear, all variations of speed being obtained by the accelerator. For starting and climbing steep hills at a slow pace two speeds will be fitted in the cars put on the market. The long bonnet covering the eight cylinders gives the car a rakish appearance. At all speeds the engine runs absolutely quietly, and only the noise of the chains can be heard in the running of the car. The vehicle was only on view a few hours prior to its being despatched to Nice, and attracted considerable attention.

AMONG the visitors to the Exhibition on Wednesday were the Lord Chief Justice (Baron Alverstone), Lord Charles Beresford, the Marquis of Londonderry, the Marquis of Ailsa, the Duke of Sutherland, the Duke of Buccleugh, Earl Shrewsbury, Lord Llangattock, Lord Burton, Sir Francis Jeune, Lord Castle-reagh, Lord Lovat, Lord Hastings, Lord Chesterfield, Sir George Newnes, Bart., the Hon. A. Stanley, M.P., the Hon. J. Scott Montagu, M.P., Sir Herbert Ashman, and Sir Swinfen Eady.

THE ladies present included Princess Henry of Pless, the Marchioness of Londonderry, the Dowager Countess of Shrewsbury, the Countess of Dudley, Lady Sackville West, Lady Rawson, Lady Ella Russell, and Mrs. George Cornwallis West.

TOD SLOAN has been an interested visitor to the Show during the week, Mr. Lewis Waller being among the representatives of the theatrical profession.

ON Wednesday a meeting of makers of heavy motor vehicles was held at the Agricultural Hall, having been convened by Mr. Mann, of the Mann Steam Cart and Wagon Company. Representatives of all the leading firms in the business were present, and considerable discussion took place as to the formation of an association to consider matters of importance to the heavy motor vehicle industry. Ultimately it was agreed to adjourn the subject with a view to further consideration.

The Motor-Car Exhibition at the Agricultural Hall.

(FIRST NOTICE.)

A View of the Great Hall from the Gallery.

BELOW we commence our report of the great Motor-Car Exhibition now in progress at the Agricultural Hall, London—an Exhibition which far exceeds in variety and number of stands any previous display held in this country. It is impossible to conclude our reports on the exhibits in the present *Journal*, and these will be continued in our next issue. The intention is that no novelty shall pass unnoticed, and that the report will present a complete review of the exhibits at the latest and largest Exhibition of 1903. Commencing with the

STEAM CARS.

An example of the "Saracen" steam-car is to be seen on the stand of Mr. J. L. Lardy. It has a neatly-finished *dos-a-dos* body seating four persons. The boiler is of the fire-tube type, 16 in. diameter, while the engine is of the double-acting variety, with simple link motion reversing gear, and develops about 6-h.p. Three brakes, all double-acting, are fitted, the two on the rear wheel hubs being controlled by Bowden wire and independent of the usual differential brake. The throttle, the positive-locking reverse, the bye-pass, independent air and water pumps and water lift (these last three being controlled by a single lever) are all conveniently situated under the driver's hand.

Several types of the well-known Weston steam-cars are displayed by the Weston Motor Syndicate, among which we noticed one fitted with a canopy and a coolie seat at the rear, intended for use in India. To this end the boiler is fitted with a special burner adapted to use paraffin as fuel instead of petrol. Several modifications have been introduced in the 1903 models, including the introduction of a super-heater between the throttle valve and the boiler. This was described and illustrated in one of our recent issues. The cars are now fitted with an automatic lubricating pump and with a steam air-pump. The latter is located below the footboard, and enables the driver to obtain the required air pressure by merely turning on a tap, thus obviating hand pumping.

The details of the 1903 type Gardner-Serpollet cars have already been dealt with in the *Journal*, so that a lengthy description of the exhibits of the Speedwell Motor and Engineering Company, Limited, is unnecessary on the present occasion. The cars staged comprise two of the latest carriages from the French works, one being of the new 10-h.p. type, having a special tonneau body with a detachable brougham top. A 6-h.p. car with *Roi des Belges* body is also shown, this being the first Serpollet steam-car fitted in this way. We noticed that all the tonneau cars are made in such a way that they are entered from the sides without necessitating stepping

into the road. In addition to the foregoing several 6-h.p. cars with tonneau bodies as well as a landaulette for town work are to be seen on this stand.

Interesting is the display of the Albany Manufacturing Company, Ltd., which includes the new steam car illustrated in the *Journal* on February 14th. This has been received with much favour, and we hope to have an early trip to form an opinion as to its actual work. The particular car shown has a tonneau body, and is upholstered in dark green.

Messrs. Savage Bros., Limited, are among the engineering concerns that have lately taken up the construction of heavy steam vehicles. Their wagon, which is now shown to the public for the first time, was fully described in our issue of the 7th inst., to which we refer readers for particulars. The various details of the vehicle appear to have been carefully thought out. It is designed to carry loads of from four to five tons. Messrs. Savage have also on view specimens of their artillery-pattern motor-car wheels, of which they make a speciality.

The Lancashire Steam Motor Company exhibit one of their latest types of 4-ton heavy lorries (Fig. 1), in which a number of detailed improvements have lately been effected. The boiler, which is fitted in the fore-part of the channel steel underframe, is of the fire-tube type, having 80 square feet of heating surface, and designed for a working pressure of 200 lbs. per square inch. It is constructed so that the outside shell can easily be taken off for cleaning purposes. The engine is of the horizontal compound type, having cylinders $3\frac{1}{2}$ in. and $6\frac{1}{2}$ in. diameter by 6 in. stroke. It is fitted with link motion, and large bearings. Both cylinders can be worked with high pressure steam if required, for getting out of bad places. It develops 25-h.p.; is entirely cased in, and runs in oil. Two changes of speed are provided, all the wheels being bolted to turned-up flanges, thus dispensing with all keys. Like the engine, the change gear runs in an oil-tight casing. The company's patent cushion drive is fixed on the ends of the compensating gear shaft, this allowing the engine to run almost a revolution before full power is exerted on the rim of the road wheel, thus considerably reducing the shock that would otherwise be put upon the engine when starting a heavy load. From the countershaft, two roller chains convey the power to the rear road wheels. A clutch arrangement is provided on the compensating gear shaft, by means of which this gear can be locked instantly when required. The joints of the steering gear have large wearing surfaces; the pivoted axles are worked by means of a worm and wheel enclosed in an oil-tight casing. Two band brakes are mounted on the outside of the sprockets. An automatic pump is driven

by an eccentric from the compensating gear shaft; this is fitted with double-check valves to both suction and delivery. There is also a small steam pump for supplying the boiler when the engine is standing, an arrangement being also provided for working this pump by hand when steam is down. The platform is independent of the working parts and main framework of the machine. The road wheels are fitted with weldless steel tyres, 5 in. wide at the rear, and 4 in. at the front. The front and rear axles are

to the boiler by a force pump, and is first passed through a heater and delivered to the boiler at a temperature of about 180° Fahr. The engine is a small compound. Ordinary lamp oil is used as fuel, which is burnt in the fire-box of the boiler by a burner of simple construction; the oil is forced to the burner by compressed air. The engine and boiler appear to be well proportioned and suitable for the work they have to do.

Messrs. T. COULTHARD AND Co., Limited, confine their exhibit to one

Fig. 1.—The Lancashire 4-ton Steam Wagon.

solid drawn steel tubes. The identical vehicle shown is intended for Messrs. Mann, Crossman, and Paulin, the well-known brewers, who have lately ordered two new wagons as the result of experience with one delivered some time ago. The Lancashire Company are extending their works to cope with the demand, among the orders in hand being five wagons for Johannesburg and one for India. On the same stand is shown a trailer intended to carry a load of three tons. This is of novel design, being arranged so that it may be hauled from either end. Another exhibit of

of their 6-ton wagons, which is attracting much attention. The general outlines of construction of steam-wagons are becoming somewhat standard, and Messrs. Coulthard's wagon has so recently been dealt with in the *Journal* that it will suffice to mention its more striking characteristics. The position of the boiler is behind the front axle, so that the weight is thrown more upon the driving wheels, giving better adhesion to the roads when running light. A larger bunker capacity is also by this arrangement secured. Messrs. Coulthard attach importance to control, and this is

Fig. 2.—The Coulthard 6-ton Steam Wagon.

interest is a steam lawn-mowing machine. The engine and boiler are so fitted on the machine that the bulk of the weight is on the main roller. The machine is thus nearly balanced, and is easy to turn. The boiler is of the multitubular type, containing copper tubes of special make, and a copper fire-box, the shell being of mild steel. It is constructed so that the fire-box, with tubes and crown plate, can be lifted out for cleaning; it is arranged for a working pressure of 150 lbs. per square inch. Water is fed

well shown by the powerful double-acting brakes they fit, by which the whole strain of applying the brakes is taken upon each half, no strain being put upon any other part of the vehicle. Particular attention is also given to protection of all working parts—the engine, driving and compensating gear running in an oil bath. The lubrication is entirely automatic. We understand Messrs. Coulthard have a large number of wagons on order, including several for the Mersey Dock and Harbour Board.

DR. A. W. BRIGHTMORE, of Egham Hill, Surrey, exhibits his special heavy steam wagon, built to carry a load of from 5 to 6 tons. This is of novel design and construction, the engine, boiler, and transmission being all mounted on a two-wheel tractor, which forms the front pair of wheels of the lorry, these wheels thus serving both for driving and steering; the fore-carriage, being self-contained, can be taken out of one vehicle and

is intended for hauling loads of from three to six tons on a trailing wagon, the engine itself weighing under three tons, thus coming within the tare weight allowed by the Act. The boiler is of the locomotive type, constructed for a working pressure of 150 lbs. per square inch. Coal or coke may be used as fuel. The engine has cylinders $5\frac{1}{2}$ in. diameter by 9 in. stroke. The crank shaft and second motion shaft are of steel, and are carried on horn plates. Two speeds are provided, three and six miles an hour, the change being readily effected. The engine is easily handled, all the levers and regulating arrangements being conveniently placed. It appears to form a convenient method of substituting mechanical for horse traction by those who have already a large supply of ordinary wagons.

Another new exhibitor of heavy steam vehicles is the YORKSHIRE PATENT STEAM WAGON COMPANY, who display one of their vehicles designed to carry loads up to 4 tons, and 2 tons on a trailer. A detailed description

Fig. 3.—The Brightmore 5 to 6-ton Steam Wagon.

attached to another. The carrying platform is connected to the fore-carriage by a swinging hinge joint, so that each wheel always gets its proper proportion of load, however uneven be the road. By this means any communication of strain from the carrying platform to the machinery is rendered impossible. The steering is positive, and, owing to the short wheel base, the vehicle can be manoeuvred in restricted spaces. The boiler is of the fire-tube type and works at a pressure of 200 lbs. per square inch, coke being used as fuel. The engines are of the horizontal, com-

Fig. 4.—Messrs. Tasker's "Little Giant" Steam Motor.

with drawings of this wagon was given in our issue of the 3rd August, 1901, but since then many small improvements have been effected. The boiler is on the locomotive principle as regards the fire-box, but has two short barrels instead of one long one, and is fixed across the front end of frame, making a compact arrangement; two sets of fire-tubes connect the fire-box with the chambers at each end of the barrels, and return tubes convey the gases to another chamber at the base of the chimney. Instead of a steam blast-pipe in the chimney, the exhaust steam enters the two chambers

Fig. 5.—The Yorkshire 4-ton Steam Wagon.

pound type; at a speed of 450 revolutions per minute they develop 35 h.p. Provision is made for admitting high-pressure steam to both cylinders, in case of need. The connecting rods and cranks run in oil, a two-speed gear being enclosed in the same case. The differential countershaft conveys the power to the front road wheels by means of Renold silent chains. The Brightmore vehicle contains a number of other special features, a reference to which will be found in our issue of the 24th January last.

Messrs. W. TASKER AND SONS, LTD., have on view a diminutive traction engine, to which they have given the name "Little Giant" (Fig. 4). It

formed in the smoke-box doors, where it is superheated, and escapes through a series of small jets into each return tube; by this means an absolutely silent and invisible exhaust is obtained, and an equal proportion of flame or gases is drawn through each tube, making the boiler both economical and a rapid steamer. The engine is of the horizontal, compound type, with long stroke. Cylindrical guides are provided for the piston crossheads, these having large wearing surfaces, and being fitted with dust-proof covers. The power is conveyed to the rear road wheels entirely by spur gearing. The crankshaft is carried in two inverted pedestals

bolted to the wagon-frame; to each of these pedestals a strong steel bracket is hinged, which carries the second motion shaft and rear axle bearings; the other ends of these brackets are free to slide on strong guides. The wagon-frame is carried on laminated springs fixed to the brackets by joint pins, and can rise and fall without any material variation in the working centres of the shafts. There are only two bearings to each shaft, and all the gearing is between them; the second motion shafts and rear axle run in swivel bearings, so that, however unequally loaded or how uneven the road, the shafts cannot bind in the necks. The frame is built up of channel steel and braced with diagonal stays to resist the severe cross strains in travelling on uneven roads. Two speeds are provided, corresponding to $5\frac{1}{2}$ and $2\frac{1}{2}$ miles per hour. The front axle is free to rock on the springs,

time, and when so opened all parts of the engine can be inspected. Two speeds are provided, the transmission of the power to the rear road wheels being effected entirely by gear wheels. An efficient water lifter with suction hose is provided, and the capacity of the water tank is 180 gallons, sufficient for a run of from fifteen to twenty miles. Like other steam wagons, the Hindley is adapted to be fitted with any type of body.

A novel design of heavy steam vehicle is that shown by MANN'S PATENT STEAM CART AND WAGON COMPANY, LTD. It is provided with a boiler of the locomotive type, with the fire-box sides carried back to form the engine bed and support the brackets for the necessary shafts and gearing. The same plates also compose the water tank, and form an exceptionally strong girder frame to carry the whole vehicle. The engine is of the compound

Fig. 6.—The Hindley 4 to 5-ton Steam Wagon.

so that no cross strain is thrown on the frame by the unevenness of the road; the road wheels are of the gun-carriage type, drag rods being fitted on the driving wheels to relieve the strain of driving through the spokes. A powerful screw brake, acting direct on the tyres of the driving wheels, is provided, this being claimed to be capable of bringing the loaded vehicle to a stand on the steepest incline.

Another engineering firm to take up the construction of heavy steam vehicles is Messrs. E. S. HINDLEY AND SONS, whose vehicle is now shown to the public for the first time. The vehicle is intended to carry, on ordinary roads, and up an incline of 1 in 9, a load of 5 tons. A trailer can be attached to carry two or three tons. The makers inform us that in the design the

type, with single eccentric reversing gear, and the whole runs in a dust-proof oil bath. The cylinders are 4 in. and $6\frac{1}{2}$ in. diameter by 8 in. stroke. The gearing is of cast steel throughout, with no chains, either for driving or steering, and the road wheels are 10 in. wide and fitted with an effective arrangement for locking the differential gear on occasion. It is fitted with two speeds, one of 5 and the other of $2\frac{1}{2}$ miles per hour for hill climbing. The exhaust steam is passed through a separator, and superheated to prevent the emission of visible vapour, and the boiler is constructed to burn coke for the same reason. In general design and construction the wagons follow traction-engine practice. They can be fitted with any class of sides or van bodies to suit individual requirements, or with tipping

Fig. 7.—The Mann 5-ton Steam Wagon.

points specially kept in view have been strength, lightness, durability, ease in management on the road, and the least labour and attention in maintaining in good order. The boiler, which is located in the fore part of the frame, is of the vertical fire tube type; it is constructed for a working pressure of 225 lbs., and is tested to 350 lbs. per square inch. An efficient feed-pump and an injector are provided, either of which can be used whether the vehicle is travelling or standing still. The boiler is adapted to burn either coke, steam coal, or anthracite, but liquid fuel apparatus can be fitted if desired. The engine is of the double-cylinder, compound type, reversing by link motion, and, working at 225 lbs. pressure per square inch, develops 25-h.p. Full steam pressure can be used in both cylinders occasionally to ensure starting at any time without reversing. The upper portion is covered with a light dust-proof casing, readily removable at any

gear of such construction that one man can readily tip the full load of 5 tons.

THE STRAKER STEAM-VEHICLE COMPANY, LTD., exhibit two of their heavy steam vehicles, both of the 5-ton type. One is shown without the body in order that the engine, boiler and general arrangement may be inspected, while the other is a lorry belonging to Messrs. T. and W. Farmiloe, who have had it in use for some time past, carrying loads of five tons. The Straker vehicles have been so recently described in the *Journal* (see issue February 7th, page 937) that no lengthy reference is necessary on the present occasion. That their merits are being recognised is indicated by the fact that the Straker Company have lately booked an order for no less than twenty vehicles for the Western Road Carrying Company, of Bristol.

PETROL CARS.

Messrs. FRISWELL LIMITED, have a neat display of the well-known Peugeot cars. First we have the "Baby Peugeot" with 5-h.p. motor. This is now too well known to need description. Fig. 8 illustrates the 6½-h.p. Peugeot car, which is on similar lines to the "Baby," but has a single-cylinder engine developing 6½-h.p. Three speeds forward and a reverse are provided, the power being conveyed direct to the rear live axle on the top speed. As will be seen, this little car is provided with a tonneau body, seating four persons. Well-finished specimens of the Peugeot 8 and 12-h.p. cars are also on view. The new features of these have already been dealt with in the *Journal*, so it is only necessary to summarise them on the present occasion. The 8-h.p. car has a two-cylinder vertical motor, honeycomb radiator and fan, electrical ignition, governor acting on admission, three speeds forward and reverse on one lever, direct driving on top speed, automatic lubrication by water pressure, chain drive, and tonneau body. The 12-h.p. car, one of those shown being intended for Mr. J. P. Neave, of Neave's Food, has a four-cylinder vertical engine in front; the bore of the cylinder is 105 mm., the stroke 105 mm., and the maximum speed 1,200 revolutions. The admission valves are mechanically operated, the same as the exhaust valves, with which they are interchangeable. The governor is adapted to act upon the admission of the gas and to work in conjunction with this both an accelerator and a moderator are provided; either high tension or magneto can be provided as desired. The water circulation is maintained by a honeycomb radiator, ventilating fan, and a large gear-driven centrifugal pump. Four speeds and a reverse, actuated by one lever, are available; the fourth speed is direct on to the differential shaft, from which the power is transmitted to the rear road

Fig. 8.—The 6½-h.p. Peugeot Car.

wheels by two side chains. Messrs. Friswell have also on view in the Yard "Le Passe Partout" car, the interesting history of which was given in our issue of the 14th February last.

One of the novelties of the show in the way of petrol cars is the "Soames," exhibited by the LANGDON-DAVIES MOTOR COMPANY, LIMITED, illustrated and described in our issue of February 14th last. To begin with the frame, or rather frames, there being two, one being intended for the support of the motor and transmission mechanism, and the other for the body, each frame being supported on the axles by separate plate springs. By this arrangement the vibration of the engine is entirely intercepted, while, in addition, the body can be swung upon lighter springs, so that the effects of road shock are better taken up. A standard type of two-cylinder vertical engine, developing 11-h.p. at a speed of 800 to 1,000 revolutions per minute, is employed. It is provided with a governor acting on the inlet. The water circulation is on the thermo-siphon arrangement, no pump being used. Since we last noticed this car some alteration has been made in the change-speed gear, which gives four speeds and reverse, the gear wheels being always in mesh. The two parallel shafts carrying the change-speed wheels run across the car. The first of these carries a bevel wheel, driven by either one or two bevel pinions carried by a shaft at right angles to it and directly connected to the clutch shaft. By bringing one or other of the bevel pinions into mesh the forward and reverse movements are obtained.

The whole of the gear wheels, on the first of the two shafts carrying the change-speed gear (Fig. 10), are keyed to the shaft; those on the other shaft run loose, and the method of changing speed consists of locking one or other of these gear wheels to the shaft in the following manner. The shaft is of large diameter, and has a deep slot cut in it. Each of the gear wheels has two keyways, which, when they are revolving, come opposite the slot in the shaft. To prevent the edges of the slot in the shaft catching the edges of the

keyways in the wheels, when the shaft or gear wheels become worn, the gear wheels are not carried directly on the shaft. Between each wheel is a hardened steel collar, which is fitted to the shaft without a keyway cut in it; on the outsides of these collars are fitted gun-metal rings, broader than the collars, and fitting into circular grooves in the side faces of the gear wheels. By this means the gear wheels are carried on the collars and not on the shaft, so that they will run true if the hole in the gear wheel is larger in diameter than the shaft. Lying in the slot in the latter is a steel

Fig. 9.—Section of 6½-h.p. Peugeot Motor.

bar, carrying at its end a key held up by a spring. The end of the shaft projects from the end of the gear-box proper into an oil-catching chamber. The bar carrying the key passes in the slot out through the bearing to the exterior portion of the shaft, and is fixed to a collar revolving with the shaft, and by means of which it may be drawn sideways, allowing the key to be pressed down when passing under the collars separating the gear wheels, and to spring up into the keyways of one or other of the gear wheels, and thus lock it to the shaft.

To make certain that the key has gone right home, and to prevent any possibility of its being shaken or knocked down into the slot in the shaft, and thus releasing the gears, a second steel bar lies in the bottom of the slot in the shaft underneath the bar carrying the key. The outer end of this passes out further than the bar carrying the key, and is secured to a collar by which it can be drawn sideways in the same way as the keybar. The inside end of this is wedge shaped, and when it is slid forward presses the key up into the keyway in the gear wheel, if the spring has not already done so, and prevents it from coming down again, thus locking it in position.

The action of changing gear is then as follows:—The clutch is thrown out as usual, the change-speed handle is pulled upwards; this draws back the locking bar and leaves the key controlled by its spring only. The key bar is not moved by this motion of the handle. The handle is then turned, sliding both the key bar and the locking bar along, but keeping them at the same relative distance to one another. The key is pressed down into the slot in the shaft against its spring by being pulled under the collars which

Fig. 10.—Section of Langdon-Davies Change-speed Gear.

separate the gear wheels, and springs up into the keyway of the next, or whichever gear wheel it is brought to. The handle is then pushed down, which leaves the key bar in position, but pushes back the locking bar under the key and locks it up in position.

It can be seen that the gear can be changed from any one speed to any other, whether the car is running or at rest. If the keyway in the required gear wheel should not be in position when the car is at rest, it will not be possible to push the key up by the lock, and the change-speed handle

cannot be pushed down, but directly the wheels are revolved the handle will fall of itself and effect the lock.

Owing to the key being pressed entirely out of engagement when passing under the collars separating the gear wheels, it is never possible to get two sets of gear into engagement at once. From the gear-box the power is transmitted to the rear axle by two chains. Much thought has undoubtedly been expended on the design of this car, which has been the centre of attraction all the week.

Fig. 11.—The Boyer 12-h.p. Limousine.

An imposing array of cars is made by the CLINGOE AUTOMOBILE SYNDICATE, LIMITED, prominent among which are a 7-h.p. Panhard car, a 9½-h.p. Clement, and a 9-h.p. De Dion. Three sizes of Boyer cars, 12-h.p., 16-h.p., and 24-h.p., are also to be seen. Of these we select for illustration the Boyer 12-h.p. limousine (Fig 11). This is fitted with a two-cylinder Herald engine, governed on the admission. The general arrangement is very much on the lines adopted in the Panhard cars, the power being conveyed through a clutch and gear-box to a differential countershaft and thence to the rear road wheels by side chains. Four speeds and a reverse are provided. The 16-h.p. and 24-h.p. cars are on similar lines, except that

the engines comprise four cylinders. Much attention appears to have been devoted to the carriage work of these vehicles, which is, we might add, of English execution.

The "Firefly" cars exhibited by the Firefly Motor Company comprise examples of the 6-h.p. and 10-h.p. models. The 6-h.p. tonneau (Fig. 13) is fitted with a De Dion engine, water-cooled by pump and radiators. Three speeds forward and one reverse are available, the top speed being direct. The power is conveyed by bevel gear to the rear live axle. A double-acting band brake is mounted on the propeller shaft, actuated by pedal; also internal expanding brakes on the rear hubs, operated by side lever; the

Fig. 12.—The James and Browne 9-h.p. Petrol Landaulette.

application of either brake throws the engine out of gear. The 10-h.p. Firefly twin-cylinder car has three speeds forward and reverse, with a direct drive on top speed. The connection between the gear box and the rear wheels is by a countershaft and side chains. Cardan joints are fitted between the gear box and the sprockets and between the gear box and the clutch, to obviate unnecessary wear in the gear box. The frame is supported on the axles by long front springs and a transverse spring at the rear. A chassis of a 7-h.p. Panhard car is also shown, while a well-finished specimen of the 9-h.p. Clement cars may also be inspected.

An interesting display is made by Messrs. James and Browne. First we noticed a 9-h.p. chassis, in which the various special features can be seen at a glance. As is now well known, these include a two-cylinder engine of the horizontal type, with the fly-wheel set in the centre of the

Fig. 13.—The "Firefly" 6-h.p. Car.

frame and rotating in the same direction as the road wheels. The motor runs at the relatively slow speed of about 500 revolutions per minute normal, perfect control and quiet running being obtained by the "throttle" governor. Another feature is the ease with which the valves may be removed, this being effected by simply loosening two butterfly nuts. The

hibited. This can be closed or opened as desired, and is now fitted with an arrangement enabling the motor to be started from the seat. The new 18-h.p. car has a double tonneau body, seating six persons comfortably. The bonnet on this vehicle is hinged longitudinally, instead of to the dashboard, so that half can be lifted up on either side for examination of the

F Universal Joints.

G Propeller Shaft.
H Live Axle.

K Silencer.

lubrication has been so arranged that by the use of special relief valves, which maintain a vacuum in the crank cases, it is practically impossible to over-lubricate. The fact that the lubricator is also turned on and off by one tap only should prove a great convenience. Two sizes of the James and Browne car are made—a 9-h.p. double-cylinder and an 18-h.p. four-cylinder—the cylinders being 4 in. diameter by 6 in. stroke. The transmission is effected through parallel shafts, no bevel gear being used in the

motor. Generally it may be said that the James and Browne cars have been carefully thought out, and built on sound lines.

We gave a description in a recent issue of the principal improvements in the Argyll cars for the 1903 season, and also an illustration of the new 10-h.p. two-cylinder car. It is, therefore, only necessary to briefly mention that the HOZER ENGINEERING COMPANY have on view two well-finished tonneau cars, one being fitted with 10-h.p. two-cylinder Clement motor

Fig. 15. Plan of Chassis of "Peerless" 18-h.p. Car. (See next page.)

main drive, the countershaft being connected to the rear road wheels by two side chains. Four speeds forward and one reverse, actuated by one lever, are provided. The lubrication of all the bearings is obtained by the use of ring boxes, and is entirely automatic. The clutch is composed entirely of metal. Of the 9-h.p. type, a tonneau and a landaulette (Fig. 12), the latter resembling an electrical vehicle in outward appearance, are ex-

and one with 9-h.p. single-cylinder De Dion engine. The 10-h.p. chassis (Fig. 14) is well worthy of inspection, the new methods of operating the change-gear striking us as being a great step in the right direction. The change-speed lever moves from a central position in three directions. When it is pushed outwardly in the centre of the quadrant across the car the first speed is introduced; when it is pulled towards the driver's seat the second

speed is engaged, and when pushed forward the third speed is obtained. In each direction the change-speed lever goes to a full stop, so that there are no notches to find, and therefore a mistake cannot be made in changing gear in the dark. Another feature of this car, which is fitted with Aster motor, is the latest type of honeycomb radiator and fan, the Hozier Company being now able to fit this to their cars if desired by clients.

Probably the first American car built on Panhard lines to be seen in England is that shown on the stand of the PETROL MOTOR POWER COMPANY. It is an 18-h.p. car (Fig. 15) built by the Peerless Motor Car Co., of Cleveland, Ohio, and that it is up-to-date will be seen by the fact that the motor is governed on the inlet, and that the water-tank is combined with the radiator, which is set in the front opening of a square bonnet. The 18-h.p. motor, however, comprises but two cylinders. Three speeds forward and a reverse are controlled by a single lever, the power being conveyed through a pedal-operated clutch to the gear-box, and thence by an universally-jointed shaft and bevel gear to the rear live axle. On the top speed the power is transmitted direct. The various details appear to have been well considered, a useful feature being the hinging of the steering column just below the hand-wheel to allow of easy access to the driver's wheel. The motor is of the vertical type with the crank shaft lubricated by means of ring oilers running in oil pockets. The crank pins are oiled by force feed, which also automatically lubricates the cylinders and all bearings. The two cylinders are one casting, two hand holes being provided in the bottom

Fig. 16.—Plan of Chassis of Rambler Car.

of the crank case which renders possible inspection, adjustment, or replacement of the connecting rod bushing. The same firm exhibit the Rambler car illustrated in our issue of the 29th November last. A number of improvements have been introduced in the 1903 models, these comprising the adoption of a 6½-h.p. single-cylinder (5 in. by 6 in.) motor, and artillery wood wheels in place of those of the cycle type. The wheel base has been lengthened six inches, and the body brought two inches lower. A new carburettor with float feed has been introduced, while the cooling system has been enlarged so that there are now nearly 400 radiating tubes instead of 200. The axles are heavier, and mudguards are now being fitted to all wheels. We give in Fig. 16 a view in plan of the chassis of the Rambler car.

The VELOX MOTOR COMPANY, LIMITED, have on view a 12-h.p. chassis and three complete cars of the same power. As the details of these vehicles were fully described in our issue of the 17th January last, no lengthy reference is necessary. We may add, however, that the vehicle shows signs of having been most carefully thought out, the chassis and the carriage

work being of the highest grade. The tonneau portion is exceedingly roomy, and has ample accommodation for three persons. Useful drawers are placed below the rear seats, while under the rear floor board is ingeniously contrived a long, shallow drawer to carry spare tubes, etc. We learn that the Velox Company are bringing out two new types of cars—of 4½-h.p. and 8 to 10-h.p. respectively.

The DURYEA MOTOR COMPANY display five or six 10-h.p. cars, including "Rumble" phaetons, tonneaus, and a phaeton fitted with a detachable brougham top. It is entirely enclosed, and has been designed for winter use, particularly by doctors. The Duryea cars have already been described in these columns, but it may be mentioned that the principal mechanical

Fig. 17.—The Duryea Three-wheel Phaeton.

features are a triple-cylinder balanced motor developing 10-b.h.p., one-piece nickel steel live axle, direct chain transmission without countershaft, throttle control, irreversible steering without worm gear, magneto ignition, natural water circulation without pumps, and one-hand control. The changes in the latest models comprise a new condensing tank, with projecting ears at the rear of the body, a special detachable exhaust-valve seating, and an improved silencer. A new car is a six-seated tonneau with canopy, a feature of which is an improved form of one-hand control lever, this being of the cross-lever type in place of the straight vertical lever usually fitted. The Duryea Company are fitting English-made bodies to the Duryea chassis.

The "Northern" two-seated runabout is again shown by MESSRS. JOSEPH COCKSHOOT AND COMPANY, LIMITED. As we gave an illustrated description of this vehicle in our issue of 7th February last, no lengthy reference is necessary. We may, however, mention that the vehicle is of American construction, and belongs to the single horizontal cylinder class of cars, with side spring suspension. The bore of the cylinder is 4½ in., and the stroke 6 in.; the normal speed is about 600 revolutions per minute, at which the engine develops 5-h.p. The admission and exhaust valves are both actuated mechanically. Two forward speeds and a reverse, with direct or "free" drive on the high gear, are provided, the planetary type of variable speed gear being used.

One of the exhibits in the Gallery which is attracting considerable attention is that of Captain H. H. P. Deasy, who has on view the chassis of a 20 to 22-h.p. Rochet-Schneider car. Its main features, such as honeycomb radiator, mechanical inlet valves, magneto ignition, and governor acting on the

Fig. 18.—Chassis of Rochet-Schneider 22-b.h.p. Car.

inlet, were described in our report of the Paris Salon. The vehicle, which in design and construction is a close copy of the Mercedes, makes hardly any noise when in operation, the throttle valve, controlled from the handle bar, enabling the engine to run quietly at all speeds from 150 to 1,000 revolutions per minute. The motor is of the vertical four-cylinder type, the cylinders being 100 mm. in diameter by 150 mm. stroke. Each cylinder has a separate switch, by means of which it can be insulated from the three others whenever it may be necessary to verify the working of the motor. In order to reduce noise the gear wheels of the cam pump and magneto shafts are made of discs of fibre interposed with those of gun metal,

One of the two exhibitors in the handsomely decorated King Edward's Hall is the **SIDDELEY AUTOCAR COMPANY**, who have on view a range of Siddeley cars from 5-h.p. to 12-h.p. The Baby Siddeley has a 5-h.p. engine, three speeds forward and reverse, the power on the top speed being transmitted direct through bevel gear to a live axle. To those seeking a reliable little two-seated car an inspection of this vehicle may be recommended. The 6½-h.p. car is an enlargement of the "Baby," and is fitted with a tonneau body enabling it to carry four persons. Other cars to be seen on this stand include several 8 to 11-h.p. vehicles with two-cylinder motors and a couple of 12-h.p. cars, one finished in silver-grey and red and one in pale blue. The latter are on up-to-date lines, the four-cylinder motor which develops up to 16-h.p. having mechanically-operated inlet valves, magneto ignition, honeycomb radiators, and other 1903 improvements. Four speeds forward and a reverse motion are provided, the gear box being connected by bevel gear to a differential countershaft, the power being conveyed thence to the rear wheels by chains. Altogether the vehicle has the appearance of being not only speedy but of sound and reliable construction.

Mr. F. H. HUNT confines his exhibit to a *chassis* and complete *vis-a-vis* illustrating the Maurer-Union system of cars. They are both fitted with 5-h.p. single-cylinder motors; the novel feature, however, being the method of transmitting the power, this being effected through a friction-driven disc. The system has already been illustrated and described in the *Journal*.

Among the several popular-priced cars that have attracted attention during the week is the "Emerald," (Fig. 19) shown by Mr. DOUGLAS S. COX, of West Norwood. It is a little two-seated car, with frame built of steel and wood. The engine, which is located under a bonnet in the forepart, is of the vertical, single-cylinder type. It is of 4-h.p., the cylinder being 80 mm. diameter by 108 mm. stroke. The ordinary system of electrical ignition is adopted, while the water circulation, for the cooling of the engine, is on

Fig. 19.—The "Emerald" Light Car.

the thermo-siphon system. Two speeds are provided, a long wide belt conveying the power to a short intermediate shaft at the rear. On this is mounted a Bozier gear, giving two speeds and free engine, spur gearing connecting the intermediary shaft with the rear axle. Inclined wheel-steering, 28 in. cycle type wheels are other features of the little car, which is said to be capable of attaining a speed of 28 miles per hour. Two pedal-operated brakes are provided, while there is ample accommodation for luggage.

The "Carpevian" car is attracting much curiosity from those on the look-out for a small-priced vehicle. Reference has already been made to its features in our columns. Briefly summarised, they include a 2½-h.p. air-cooled engine, a friction clutch and chain gearing controlled by a lever with three movements, a weldless steel tube frame, electric ignition, and two band-brakes. The car has three wheels of the wire type and there are seats for two passengers. The top speed of the Carpevian car, which is shown by Messrs. CHAS. PEACOCK AND COMPANY, is eighteen miles per hour.

A car on somewhat novel lines is the "Hermes," of the AUTOCAR CONSTRUCTION COMPANY, LIMITED, which exhibits two vehicles—a double phaeton and a delivery van—the two being identical as far as concerns the general arrangement of the *chassis*. The motor in the phaeton is of the horizontal four-cylinder opposed type, developing 25-h.p. at the normal speed of 700 revolutions per minute. Four speeds forward and a reverse are obtained by means of a special form of change gear and two roller chains. The frame is of channel steel, the motor and gear case being suspended on two large tubular cross stays. The front end of the rear spring is carried on a sliding guide on the frame. A novel feature of these cars is that the body is arranged to slide off the frame to the rear to give accessibility to the motor and mechanism, and to facilitate cleaning. Among other points in the Hermes cars may be noted the ease with which the motor and gear can be removed from the frame, the protected chains, and a device for illuminating the lubricators at night. All the shafts are parallel, no bevel

wheels being employed. The delivery van is of a neat design, and is intended to carry loads up to 25 cwt. It is fitted with a horizontal two-cylinder (opposed) motor, developing 15-h.p. In other respects the details are the same as in the phaeton. The body is not arranged to slide off the frame; instead, to give access to the engine and gear, hinged panels are provided in the sides of the body. The vehicle has a substantial appearance, and a good point appears to lie in the fact that the load is carried between the four road wheels.

To meet the demand for a popular-priced car the CROWN CAR COMPANY have introduced a novel three-wheel, two-seated vehicle, which is to be

Fig. 20.—The "Crown" Car.

seen in the Gallery. The power is supplied by a twin-cylinder air-cooled engine of 5 h.p., fixed immediately over the front wheel, to which the drive is transmitted by means of a friction clutch and chain. Control is by throttle and ignition, actuated by Bowden wires from the tiller steering arm. The Company state that their reason for using such a large motor in relation to the weight (1½ cwt.) is to eliminate any form of change-speed gear, the car speed being regulated by the admission of gas to the engine by means of a throttle and the ignition. Three brakes are fitted—one to each wheel; a tyre brake on each rear wheel, and a band brake on the sprocket drum. The latter has a braking surface 52 in. in circumference, sufficient, it is claimed, to stop the car in its own length.

Prominent on the stand of Messrs. R. REYNOLD JACKSON AND COMPANY is the "Jackson" 8-h.p. dogcart, of which an illustrated description was given in our last issue. A little vehicle also shown which is attracting considerable attention by reason of its relatively low price is the "Jackson Covert" two-seated car (Fig. 21). This is fitted with a 3-h.p. vertical motor located in the rear of a tubular frame. The cylinder is air-cooled,

Fig. 21.—The "Jackson-Covert" Car.

but a water-cooled head is provided, the circulation being on the thermo-siphon system. Two speeds are provided; the engine transmits its power by a chain to a short countershaft about the centre of the frame. On this are mounted two combined sprocket wheels and clutches, the power being conveyed to the rear live axle by either one of the two chains provided. Steering is controlled by a side tiller, on the pillar of which the change-speed and advance ignition levers are mounted. The vehicle complete weighs only about 2 cwt. On the same stand are also to be seen one of the well-known Stirling 5-h.p. dogcarts and one of the latest types of 12-h.p. Gobron-Brillié cars.

Considerable interest is being shown in the *chassis* of the 11-h.p. "Earl" car (Fig. 22) on the stand of the GREAT CENTRAL GARAGE, LIMITED. The general arrangement follows the now generally adopted lines, a two-cylinder motor being set in the fore part of a steel-armoured wood frame. The engine runs at a normal speed of 800 revolutions per minute, and is fitted

FIG. 22.—Chassis of "Earl" 11-h.p. Car.

with a governor, which acts on the exhaust valves in such a manner that it works very silently. The transmission is on Panhard lines, except that on the top speed the power is conveyed direct; three forward speeds and a reverse, controlled by one lever, are provided. Electric ignition is employed, with a special form of contact breaker; everything is in readiness to fit tube ignition if required. Equal size wheels, shod with 800 by 85 mm. pneumatic tyres; Dubrille lubricator to engine and crank chamber, working automatically, drop feed lubricator to all parts, are other features of the "Earl" car, which appears to be of sound construction throughout. A complete car is also shown, this having a comfortable body of the Roi des Belges type. On the stand are well-finished specimens of the 7-h.p. Panhard, 12-h.p. Darracq, and 9-h.p. Renault cars. The company have lately taken up an agency for the Charron, Girardot and Voigt cars, of which a 15-h.p. four-cylinder vehicle is shown. The details of the C.G.V. vehicles, to give them a short name, have already been given in these columns, so that it need only be mentioned that the frame is built of tubes into which ash is driven, while among the noteworthy features are the hot-water jacket to the carburettor and the expanding band brakes on the hubs of the rear wheels.

An imposing array of Panhard cars is made in the King Edward's Hall by Mr. J. E. HUTTON. These include examples of the 7-h.p. two-cylinder, and 10 and 15-h.p. four-cylinder types. The details of these vehicles have already been dealt with in the *Journal*, so that on the present occasion we need only recommend visitors to the show to an inspection of the *chassis* of the Panhard 10-h.p. *legere* car, the motor of which is fitted with the new Krebs carburettor. The bodies of the vehicles, which are the work of Messrs. Thrupp and Maberley, are also worthy of mention; these including tonneaus, a Lonsdale, and one with a special body of the Roi des Belges type. Mr. Hutton expects to have on view, ere the Show closes, at least one example of the 1903 Mercedes cars, but at the time we visited the stand this had not put in an appearance. In a corner of the stand Mr. Hutton is demonstrating the capabilities of the Pogon sparking plug, of which a description was given in our last issue. By means of a clockwork mechanism, a plug, connected up to a coil and battery, is made to dip at regular intervals into a bath of dirty oil. This, apparently, has no effect on the plug; indeed if anything it appears to spark better in the oil than out.

While outwardly closely resembling the now-standard type of petrol car, there are a number of special features in the 10-h.p. *chassis* and complete tonneau car exhibited by the MOTOR VEHICLE ENGINEERING COMPANY. The frame is of wood and steel, in the fore part of which is carried a two-cylinder motor developing 10-h.p. at a normal speed of 750 revolutions per minute. The governor is adapted to act on the inlet, an accelerator

being also provided by means of which the speed of the engine can be regulated as desired. The ordinary system of electric ignition is employed, a special form of wire, referred to below, being adopted. The water circulation is maintained by a pump, and a special form of combined ribbed radiating coil and tank, with fan. In the construction of the cooler no solder is made use of, and there are no joints beyond those at the connections of the induction and suction pipes. The pump is driven by gearing encased within a prolongation of the crank chamber, and running in oil. The power is conveyed through a friction clutch, gear-box, and bevel gear to the rear live axle. Four speeds forward and a reverse are provided, the drive on the top speed being direct. The change-gear is of the sliding type. Special provision has been made to obviate all strain on the shafts; between the clutch and gear-box, a flexible joint is provided, while the longitudinal shaft has a joint which is both universal and telescopic. The live axle is of strong construction, and well supported. Another point about the car worthy of notice is the brakes; these are of the internal expanding type, one being attached to each of the rear road wheels, these being actuated by a hand lever, and one, operated by pedal, being located on the forwardly-extended end of the secondary change gear shaft. The main bearings are lubricated on the ring system, the only lubricator on the dashboard being that which feeds the oil to the motor crank chamber. The car, which is known as the "Grand," has equal wheels shod with 90 by 810 mm. pneumatics. A long wheel base is adopted, enabling a large amount of leg room to be given to both the front and rear portion of the tonneau body. The Holsby system of electric ignition wiring referred to above consists essentially in so wiring the car as to produce the effect of a powerful electrical condenser, the advantages of which are said to be that the electro-motive force at the sparking plugs is greatly augmented, whilst an increase in the "fatness" of the spark is found to accrue. A special form of cable is made use of, and this is heavily sheathed in lead, whereby the above advantages are secured, whilst danger from breakdown due to abrasion of the insulation and its destruction from the solvent action of oil and petrol is entirely obviated.

Messrs. VAN TOLL AND Co. display a couple of the Cottareau cars, to which reference has been recently made in the *Journal*. One of the vehicles is a 10-h.p. tonneau with canopy. The frame is of tubular construction, with the motor under the bonnet in the fore part. The two cylinders of the engine are set V-shape, the piston rods working on to a central crank shaft. The cylinders are 90 mm. diameter by 115 mm. stroke, the normal speed being 1,200 revolutions per minute. The automatic governor is adapted to act on the inlet, a foot "accelerator" being also provided. Three speeds forward and a reverse are obtained by means of a train of sliding pinions of the Panhard type, the power being transmitted through a clutch and gear-box to a cross shaft which is connected to the rear axle by a single centrally-located chain. The car, which is provided with hand and foot brakes, and inclined wheel steering, weighs without body about 10 cwt. The 7-h.p. car is on identically similar lines, the only difference being in the motor, which has cylinders 85 mm. by 110 mm. stroke. Messrs. Van Toll also display one of the neat little "Citizen" two-seated cars. The motive power is supplied by a Clement 5-h.p. single-cylinder motor. Electric ignition is fitted, the wires being well insulated and so arranged that short circuits are almost impossible. The coil, battery, and lubricating oil tank are fitted in a neat case behind the dashboard. The power is transmitted to the road wheels by means of a steel shaft running direct to the back axle. Wheel steering is fitted on a strong inclined pillar, to which the change speed, advance, sparking, and other levers are attached. Two speeds are provided, the gear wheels being always in mesh, and thrown into gear by square jaw clutches, which are operated by a lever on the steering pillar.

Prominent features on the stand of Messrs. H. E. HALL AND Co. are the *chassis* of the latest types of 20-h.p. four-cylinder Darracq cars, the main features of which were described in our report of the Paris Salon.

FIG. 23.—The Darracq 12-h.p. Car.

This, like the 12-h.p. cylinder car (Fig. 23), is fitted with mechanical inlet valve, stamped steel frame, Mercedes-pattern radiator, throttle-governed carburettor controlled by a lever placed on the steering wheel, and direct drive on the top speed. Of the 12-h.p. cars, three with tonneau bodies are shown, as is also an example of the 9-h.p. Darracq car.

Messrs. A. DARRACQ and Co. and "AUTOMOBILA" make a large display of the now well-known Darracq cars, ranging from the 20-h.p. to the 8-h.p. vehicles. The 20-h.p. car has a four-cylinder engine, with mechanically operated inlet valves, honeycomb radiator, a governor acting on the inlet, and an accelerator arrangement operated from the steering wheel. The 12-h.p. and 9-h.p. cars have twin-cylinder engines, the 8-h.p. having a single-cylinder motor. All the cars have three speeds forward and reverse, the power being transmitted to the rear live axle through a longitudinal

Fig. 24.—The "Lems" Electrical Runabout.

shaft and bevel gearing. The general features are now too well-known to need description at this time.

The HIGHGATE MOTOR-CAR COMPANY, of which Mr. J. Keele is manager, show Darracq cars and also a "Continental" car, fitted with a serviceable type of hood. The latter has a 6-h.p. engine and three speeds and reverse. Among the Darracqs is a 8-h.p. tonneau, upholstered in a rich red colour, and a 12-h.p. twin-cylindered Grande de Luxe car with Clipper-Continental tyres. The Highgate Company, which has recently increased its garage accommodation, is concerning itself largely with Darracq vehicles.

ELECTRICAL EXHIBITS.

A neat electrical runabout forms the display of Mr. W. A. CROWDUS. The frame is of tubular construction, the electric motor, which is supported at the rear, driving the back axle through bevel gearing. The battery consists of 44 cells, one charge being sufficient to run the car a distance of about fifty miles. The feature of the vehicle is the one-lever control, all the various operations of steering, speed changing, and applying the brakes being made by means of the tiller. Five speeds are available, varying from three to twenty miles per hour, with the same number of speeds in the reverse direction. In addition to an electrical brake, operated through the controlling lever, a double-acting brake, actuated by foot pressure, is provided, this acting on the rear wheels.

On the stand of the LONDON ELECTRO-MOBILE SYNDICATE, the Hart Accumulator Company are showing a variety of the Hart accumulators for traction and ignition purposes.

The AUTOMOBILE SUPPLY COMPANY, LIMITED, have on view a Scheele electrical car, supplied with two bodies—a victoria and a brougham—the connection being such that one can be quickly substituted for the other. The vehicle is provided with a battery of 40 Hagen cells of a capacity sufficient to run it a distance of forty miles on one charge. Two electrical motors are fitted, these driving the rear wheels through spur gearing. The controller is adapted to give five forward speeds, two reverse and two braking positions.

Messrs. SALMONS AND SONS display a large Stoeuer electric public-service omnibus, to seat fourteen persons. This is of German construction, and appears to be built on substantial lines. Two electric motors drive the rear wheels through spur gearing. The electrical energy is supplied by a battery of forty Leitner cells of a capacity sufficient to run the vehicle a distance of about seventy miles. The battery is divided up into three groups, and located under the seats. The controller is adapted to give four forward speeds, one reverse motion, and an electrical braking position. A pedal actuates a brake on the motor shaft, while a hand lever controls tyre brakes on the rear wheels. The car complete weighs about two tons, and is intended for speeds up to fourteen miles an hour. Messrs. Salmons are old-established carriage builders, and of recent years have devoted much attention to the construction of bodies for motor-cars. They have view on a finished tonneau in aluminium and wood, and one in aluminium in the rough. On this stand are also to be seen samples of paraffin and acetylene lamps, etc.

Among the electrical accessories shown is a good type of accumulator charging board, brought out by Messrs. W. J. BISHOP AND COMPANY. This is intended for charging small accumulators from the ordinary house supply where the current is continuous. Accumulators suitable for motor-cars and launches are also exhibited. The method adopted to separate the plates prevents their short circuiting even when submitted to the roughest treatment. Coils with tremblers, switches and interrupters, measuring instruments and induction coils are also included in the firm's display. An incandescent lamp for accumulator testing and inspection purposes, etc., in which the lamp is protected from breakage by a protecting metal reflector, which also has the effect of increasing the light when used for inspection purposes, completes the display.

The LONDON ELECTRO-MOBILE SYNDICATE, LIMITED, display three neat two-seated runabouts, one being marked as sold to Lord Salisbury. The electric motor is carried at about the centre of a tubular frame, and drives by spur reduction gear a small counter-shaft, which is connected to the rear axle by a centrally-located chain. The electrical energy is furnished by a 45-cell battery arranged in five groups, and having a capacity sufficient to run the car a distance of about 40 miles on one charge. The controller is adapted to give any desired forward speed from three to twelve miles an hour, and a reverse motion, while in one position an electrical brake is obtained. Steering is controlled by a tiller, while there are two pedal brakes, one acting on the rear axle and one inside the large spur-wheel on the short countershaft. Artillery or cycle-type wheels, 26 in. diameter and shod with $2\frac{1}{2}$ in. pneumatic tyres, are fitted. The car (Fig. 24), which is neatly finished, weighs in running order about 10 cwt.

MOTOR BICYCLES.

Disappointed by the shippers, Messrs. COXETER AND SONS, LTD., are not able to exhibit the "Abingdon" $6\frac{1}{2}$ h.p. two-seated car with three-speeds and reverse, of which they are making a speciality. They have, therefore, to be content with showing a Kerry $2\frac{1}{2}$ h.p. motor-bicycle, and a machine of their own construction with $2\frac{1}{2}$ h.p. Minerva motor. Among the details of these machines we notice a new belt-fastener, which we shall probably illustrate in a later issue. On the same stand are shown specimens of lamps, fur coats, etc.

On the stand of Messrs. Salmons, the REMINGTON AUTOMOBILE AND MOTOR AGENCY have on view one of the Orient motor-bicycles. The motor has a range of from $2\frac{1}{4}$ to $3\frac{1}{4}$ horse-power, and is located within the frame. The petrol tank is placed at the back of seat, and holds five quarts, or sufficient for a run of 75 to 100 miles according to condition of roads. The lever controlling the supply of mixture to the motor is placed just under the point of the saddle, and within easy reach of the rider. This lever regulates the supply of air to the carburettor, and throttles the supply of mixture to the motor when less power is required. A flat belt conveys the power to the rear wheel.

After much experiment and trial the NEW HUDSON CYCLE COMPANY, Limited, have now finally completed their standard motor bicycle, specimens of which may be seen at their stand. A view of the machine is given in Fig. 25, from which it will be seen that the engine is placed vertically in the frame, which is of special design. A noteworthy feature of the machine is the narrow tread which has been secured. This has been brought down to $5\frac{1}{2}$ in., owing largely to the adoption of the De Dion bicycle motor, the New Hudson Company being the first English firm to adopt this motor in a large way. The engine is rated at 2-h.p., the mixture being furnished by a Longuemare carburettor. The ignition is on the usual high tension accumulator system. The petrol capacity is sufficient for a run of 100 miles. Lubricating oil is stored in a separate compartment, and

Fig. 25.—The "New Hudson" Motor Bicycle.

is supplied to the crank case through a special form of automatic sight feed lubricator. The levers for speed regulation, etc., are conveniently situated. Transmission is by a 3-ply copper sewn belt of V section, running in pulleys grooved to the correct angle. The weight of the machine when fully equipped is 87 lbs.

MOTOR CLOTHING.

MR. ALFRED DUNHILL's airships are effecting their purpose in drawing visitors to his large and representative collection of motor clothing and accessories. So extensive has his trade in the former department become, that he has recently had to erect a new factory capable of accommodating a hundred workpeople; while his exhibit is now divided into two sections, one particularly devoted to ladies' clothing. Quite a realistic interest is given the stand by the presence of a car whereon two ladies are seated in all the latest models of motoring attire. New washable dust coats constitute a section of the display, and we notice an improvement has already been made on the gauze face shield exhibited at a recent show. This is now made with a length of mica inserted in the screen, thus securing a perfect vision while shielding the face from the weather. Motor hats in straw are a novelty at the stand, whereon is a collection of leather clothing, aprons, fur garments, and accessories of all kinds. A high-class display by Messrs. W. J. LOVEGROVE AND COMPANY is a feature of the tailors' section of the Show, and in hats and caps some innovations in style have been introduced which visitors should inspect. The "Drimosit" motor rug is again made a leading feature, this ensuring a thoroughly dry person while driving or travelling, and providing a useful garment for walking. It has already been fully described in our columns and is coming largely into general favour. In leather raiment, fur coats, and ordinary cloth garments some good styles are shown. A new speciality brought out for the 1903 Show being a dust coat for ladies' wear. This is a class of garment much in demand, and Messrs. Lovegrove and Company have done their best to make the supply. The next stand is that occupied by Messrs. ABBOTTS (Abbott, Anderson, and Abbott), whose experience in connection with the equipment of yachtsmen has been brought to bear in designing garments for motorists. Silk oilskin aprons for covering ordinary fur rugs in wet weather are a fresh feature of their display, and a new rubber waterproof overcoat, weighing under sixteen ounces, is a decided innovation which should attract considerable attention during the coming summer. All their coats for motorists are characterised by a particularly wide skirt, considerably adding to their comfort when sitting on the car. All Wool motor clothing is the exhibit of main interest on the stand of Messrs. HOARE AND SONS, whose driving coats, "Auto-cloak," rubber Poncho, "Storm" smock, and combination livery suit are well adapted for the comfort and protection of motorists. A new sac coat, the "Rex," is notable for the amplitude of the skirt, which forms a warm rug covering for the knees. "The Companion's Cloak" can be worn by either lady or gentleman, thus providing a useful garment for the wardrobe of motorists who may have visitors unequipped for motoring. The new livery has already been supplied to the Viceregal Lodge, Dublin, and provides a practical combination of three articles in one. The long livery coat is fitted with a removable skirt and is specially adapted for chauffeurs' wear. When worn complete it forms a smart livery; when required for touring or country use, the lower part of the coat can be removed, leaving a jacket only. The long coat is made in thick doe cloth, and the skirt serves a doubly useful purpose, for when it is not in use it forms a rug, being lined throughout with wool. Leather clothing in great variety is also displayed by Messrs. SALSBUURY AND SON in the Gallery. Fur costumes, grey China goat coats, ladies' dust coats, the "Komilfo" coat, and other garments make up a good show, while the accessories exhibited include goggles, gloves, gauntlets, etc.

MISCELLANEOUS.

Specimens of repairs to tyres are shown by the IMPERIAL TYRE AND RUBBER COMPANY, who have recently laid down special plant in London for vulcanisation. The system adopted by the company is quite modern, they having brought from America an expert in single tube repair to superintend the operations at their new works. Specimens of tyres in a very dilapidated condition are shown, as well as other tyres which have been repaired to a condition of efficient service. The company also show some single tubes in which rubber patches have been vulcanised in—a much more secure method of repairing tyres than that usually employed. One notable feature of the display is the excellent quality of the rubber used for repairing tyres, in which department the company is doing good business.

A preparation for the repair of inner tubes and outer covers without the aid of patches, known as Patcho, is shown by PATCHO, LIMITED. This speciality is going largely into use, its merits being well recognised.

A large display of motor and brougham wheels fitted with Martin pneumatic tyres is made by the MARTIN PNEUMATIC TYRE COMPANY, LIMITED. These are so well known to motorists, and have so recently been referred to in these columns, that extended notice is now unnecessary.

The "Firestone" motor-tyre is a new speciality exhibited by Messrs. J. W. and T. CONNOLLY, LTD. This is a solid tyre, and has already been in use for six months on a motor omnibus, giving satisfactory results. Strands of cross wires are moulded in the rubber at intervals of one inch. Endless side wires encircle the whole, retaining a firm grip without cutting the rubber whilst under the strain. The system effectually secures durability, and results in a solid motor-tyre suitable for vehicles weighing from 8 cwt. to 5 tons. Messrs. Connolly also show wheels, etc. but they are wisely making the "Firestone" tyre the central feature of their utilitarian display.

Rubber tyres for motor-vehicles are on the stand of the INTERNATIONAL RUBBER COMPANY, the leading idea of which is a core of rubber running through the solid rubber tyre.

Messrs. W. and A. BATES are making an interesting display of rubber goods for motor-cars, including a new single tube motor-tyre. Non-

slipping treads for motor-cycles are a speciality, having a decidedly good feature in the five or six indentations which encircle the whole of the outer cover. "Couture," a preparation for the repair of cuts in the outer covers of pneumatic tyres, is also shown by this firm.

The RUCKER pneumatic tyres and air tubes were so fully illustrated and described in our issue of November 31st that it must now suffice to say that the principle adopted is meeting with considerable favour, and that the tyres are here exhibited by the General Guarantee Association, Limited. A layer of strong thread is wound around the tube, being creased so that when it expands the creases are pulled straight. This construction secures that, when a tube is in a tyre and inflated, the cover is distended and grips on the rim as usual. Should it, however, burst in use, the result is not a burst tyre as has been the case, but only a tyre with a burst cover. The reason is that the air tube will only expand a little beyond the inside size of the cover. It then withstands the pressure of the air within it, and maintains the efficiency of the tyre till the cover can be conveniently repaired.

THE "GARE" PATENT CUSHIONED TYRE COMPANY have a steel-covered silent cushioned tyre, in which a steel shield let into a V-shaped rubber adds materially to the strength of the tyre, and may be renewed when completely worn. The tyre will fit any ordinary channel rim. A new patent motor wheel on the stand is likely to attract much attention from makers of heavy vehicles. Two metal flanges filled with V-shaped pieces of wood tapering towards the centre of the wheel constitute the rim. Between the wood blocks are placed strips of rubber.

A large display of motor lorry wheels and wheels for lighter automobiles is made by Messrs. SMITH, PARFREY AND COMPANY, LTD., who are entering with spirit and enterprise into the business of supplying motor-car makers with wheels, springs, wings, etc. Messrs. W. AND F. THORN make a very gratifying first appearance at the Exhibition with specimens of their motor bodies, the workmanship and finish of which are alike commendable. A well-lined tonneau and a covered car top deserve notice.

A fine assortment of frames, wings, dashboards, etc., in bent timber, has been brought together by Messrs. HORTON AND SONS, who also show a wheel they made in 1866. Shafts, wheels, panel boards, in all woods, are included in the display, and the firm are catering for the requirements of motor-car builders in both English and foreign timbers.

The "Radial wheel," a new patented wheel for motor-cars, is shown by Messrs. J. LIVERSIDGE AND SON, LIMITED. The centre of the wheel is built up with a series of radial segments. These, with the feet of the spokes, form under pressure a solid centre. Flange plates are fixed by bolts through the top part of each segment. When an ordinary axle box is used, these flanges are tapered internally and filled with wood, the wheel being then boxed in the ordinary manner. The ordinary flanges with hub combined can be employed. By building the centre in this way greater resilience is said to be obtained, any severe shock to one part of the wheel being absorbed by the whole. Every line of contact in the centre is radial, so that the spokes and segments, in actual running, tend to become more tightly wedged together. No bolt passes through, the spoke thereby retaining its whole strength. In the event of a new spoke being required it can be put in without disturbing any of the others. The foot of the spoke is so that firmly held it has been possible to reduce its size without lessening the safety.

A specially wide tonneau body is on view at the stand of the INTERNATIONAL COMPANY, and MR. W. VINCENT comes from Reading with a very attractive display. This maker of motor bodies has had considerable experience in the work, as is evidenced by the character of his exhibit, which includes a well-outlined Roi des Belges body, in which are several refinements likely to be appreciated by lady passengers. A lever fitted in the door can be worked while the occupant of the tonneau is seated, to open or fasten the door, thus obviating the usually awkward means of egress. In the other motor bodies shown are removable doors below the seat, and other improvements that merit notice. The DUCHESS MOTOR COMPANY show a car fitted with a "Duchess" folding brougham top, a speciality they have made familiar to motorists. The idea is a good one, and the Duchess Company have carried it out in a very skilful and pleasing way. Artillery wheels for types of light or heavy automobiles form the exhibit of the ARTILLERY WHEEL WORKS, who have the advantage of possessing special plant for this class of work.

Messrs. CARLESS, CAPEL AND LEONARD show petrol storage tanks and packages specially adapted for the storage and transport of petrol, gasoline, lubricating oils, etc. "Spec'al Carline," lubricating oil suitable for motor-cylinders of high horse-power, and for high-speed water-cooled motors, is shown. The "S" lubricating oil for air-cooled motors as well as lubricating oils, graphite grease, and the firm's petrol are also on this stand. For the use of motorists having their own motor houses, the patent benzine safety lamp was brought out two or three years ago, it being designed upon the principle of the miner's safety lamp. This has proved very acceptable, and its presence on the stand should be noted by all automobilists.

The ELEPHANT CHEMICAL COMPANY exhibit specimens of their Motorol, Elephant motor grease, calcium carbide, calcoide, rubber solution, etc., all of which specialities are well-known to motorists.

The first stand on entering the Arcade is occupied by the AUTO-LUBRINE COMPANY, whose speciality—a pure hydro-carbon oil with a very high flash point—has the virtue of retaining its lubricating properties even at high temperatures. It also remains liquid at a temperature below freezing point. Thus, Auto-Lubrine is a lubricant of thoroughly reliable

quality. It is made in six grades, for water-cooled and air cooled motors, steam and electric motors, gear boxes, etc. Among the exhibits of the AUTOMOTOR ACCESSORIES COMPANY is Wellsaline, a motor-oil prepared by Messrs. M. Well and Co. This is specially made for particular purposes. For steam cars or luries working with saturated or superheated steam, there is motor-oil "S," and gear oil, gear grease, oils for air-cooled engines and for water-cooled motors are also prepared.

Miscellaneous requisites for motorists are displayed by Messrs. G. SKUDDER AND CO., whose collection of lubricators, accumulators, belts, and fasteners, &c., is thoroughly representative. Their name, however, is most intimately associated with oils and greases, the specialties including "Gripolene," a cream for belts, and "Skudderlene" oil for motors, gear-boxes, and chains, bearings, cylinders, &c.

A motor-car roughly and artistically modelled in metal forms the central feature of the display made by Mr. CH. BARDIES, and the lamps attached thereto are shedding forth an electric brilliance at night. A new Lenticular Projector is on view, which has the advantage of a moveable lens to facilitate cleaning the inside of the lamp. Hitherto these have been opened from the rear, but the new arrangement enables the interior of the projector to be kept entirely bright—a very essential condition. Blériot lamps and generators are an attractive display, one of the generators being capable of charging three lamps sufficiently well to last for seven days. A dashlamp for ordinary carbide or acetylene Blériot is an excellent production, giving quite sufficient light for town use, thus saving the necessity of lighting the headlights before reaching the country.

The "20th Century" motor head, side and tail lights, adapted for acetylene and for oil, are shown by the SOUTH BRITISH TRADING COMPANY, whose display includes a good grade of motor tools, and the "Sterling" tool kit, as well as the Fisk motor tyre, to which reference will be made next week.

MESSRS. SALSBUARY AND SON, LIMITED, draw prominent attention to their specialties in motor lamps, including the Salsbury-Dietz motor lamp, in which perfect combustion is secured by an ingenious arrangement of drafts. A parabolic reflector is adopted, throwing the rays of light straight ahead. To the "Salsbury-Flario" acetylene motor lamp an improved generator is now fitted, which is extremely clean in operation and can be used either with or without cartridge. For racing cars and others intended for high speeds the firm have brought out a Searchlight fitted with a lenticular lens concentrating the rays of light so that a strong beam of white light is thrown ahead. Tail-lamps, the Essanes-voiturette lamp, and other good devices of the kind are also shown, as well as a motor spirit transfer spout, motor brackets, the "Excelene" oils, motor wrenches, etc.

"The King of the Road" head light is shown by Messrs. JOSEPH LUCAS, LIMITED, in various sizes and styles of finish. This will fit any standard lamp bracket burning any good-coated carbide. When fully charged the large size gives a powerful light for eight hours. A useful side lamp for burning petroleum is also on view, fitted with a new locking stud for fixing the vessel. Motor horns of the snail and bugle patterns are on view, as well as the bracket for fixing horns on the steering wheel illustrated in the *Journal* last week. A tyre valve with left-hand thread, and which does not require to be taken to pieces to pass through the rim, flexible extensions, motor pumps, repairing outfits, lifting jacks, and the Wells-Lucas motools complete an interesting display.

Aluminium castings of every description are shown by Mr. R. W. COX, the exhibits being of generally varied interest as well as of automobile importance. Included among the other goods is a solder for aluminium, which can be used with an ordinary soldering iron, and without any special flux.

Automobilism is having a great effect on other industries, and is becoming one of the great factors in the consumption of aluminium. Not only is this evident from a glance at the stands of body builders, but the various stands devoted to motor castings afford further evidence of the fact. Mr. ROWLAND HILL, for example, has an exhibition of motor castings in all metals, aluminium looming largely in the general collection. Aluminium crank cases, gear boxes, etc., cast-iron water-cooled cylinders, valve castings for high pressure, steam and motor forgings of all kinds make up a very interesting stand. The BIRMINGHAM ALUMINIUM CASTING COMPANY have a good display of motor castings, including gear and crank case chambers, lubricator boxes, steering wheels, etc.

Stop watches and chronometers are on the stand of Messrs. S. SMITH AND SON, who also show a new clock for motor-car service. In this the base is thicker than the top, thus throwing the face forward, and facilitating reference. In the old style, the clock face being parallel with the dashboard, it was not always easy to see "the time of day," but Messrs. Smith and Son's new idea has got over that difficulty in an admirable way.

Enamel polishes, etc., are shown by the NUGGET POLISH COMPANY, LIMITED; and the CHISWICK SOAP COMPANY makes a feature of its Buttercup metal polish.

The petrol motor lawn mower introduced by Messrs. RANSOMES, SONS, AND JEFFERIES, LIMITED, is evidently meeting a public want, and with its new radiator appears a most serviceable piece of mechanism. The smallest size is of 2½-h.p., with a 24 in. cutting cylinder, and is capable of getting over between two and three acres a day.

In addition to their steam car, mentioned on another page, the ALBANY MANUFACTURING COMPANY, LIMITED, have a fine assortment of accessories for all interested in light steam cars, including condensers, petroleum burners, etc., and a new return water system as applied to steam cars. The Albany burners can be started in three minutes, and the new pattern

has the induction coil below the casing. They are made in gun-metal, steel, and nickel, so constructed as to break up and burn both light and heavy hydro-carbons—an important feature for those who tour in out-of-the-way places, and may have to use miscellaneous oils and spirits. The Lamplough-Albany system for the primary and secondary generation of steam in series is also exhibited. It is claimed to effect a saving of from 30 to 40 per cent. in fuel consumption, and an instance has been given us in which a car running at 20 miles per hour only consumed three gallons of petrol in a run of forty miles when fitted with the generators. Previously it had only been capable of doing sixteen miles per hour on a consumption of one gallon of petrol for every ten miles. New interest is given to the display by the presence of a radiator for petrol cars. This is of the Mercedes type, tubes of 3 in. length being utilised, the edges being expanded hexagonally, and jointed up so that only the minimum of air resistance is offered.

A miscellaneous collection of sundries for motorists is shown by Messrs. BINNEY AND SON, including leather belting, gun metal steam fittings, wood pulleys, lubricators, tools, etc. Some excellent lubricants are on the stand. GARLIO is a well-known cloth for cleaning and polishing metals, etc., and is shown in various sizes in the Arcade. The non-inflammability of this speciality is one of its great merits.

Insurance companies are recognising the possibilities of automobilism, and several are catering specially for the new conditions. The HORSE, CARRIAGE AND GENERAL INSURANCE COMPANY, LIMITED, are granting double-risk policies, and also indemnify their clients against claims by third parties for injury to persons or property. At the stand of the LAW ACCIDENT INSURANCE SOCIETY, LIMITED, information is being given concerning the special insurances for motor-car owners, arranged by that institution. These include indemnities against personal injury to owners, drivers, and passengers, claims for damage, accident, fire, and burglary. There is no restriction imposed regarding speed, and the policy has the advantage of not being subject to average. In the Gallery the GENERAL ACCIDENT ASSURANCE CORPORATION take advantage of the opportunity to make motorists acquainted with their terms of business. Mr. Alfred Nixon is the superintendent of their motor insurance department, which is being developed to considerable proportions.

In addition to steam and petrol cars, Messrs. J. COCKSHOOT AND COMPANY, LIMITED, as British agents for the Locke Regulator Company, make a display of this concern's specialties in the way of engines, boilers and accessories for steam cars. The Locke steam-engine is made in two sizes—10-h.p. and 4½-h.p. The working parts are made of case-hardened, drop-forged steel, while the piston rods and valve stems are of Tobin bronze. The crank shaft, crank pins, and eccentrics are, we noticed, provided with ball bearings. The 10-h.p. engine has two cylinders, 3½ in. diameter by 4 in. stroke, while the dimensions of the 4½-h.p. type are 2½ in. by 3½ in. Attention may also be drawn to the Locke burner for steam boilers using petrol as fuel.

To protect the occupants of motor-cars from the dust which not only follows but also settles upon them, a simple and effectual screen has been devised by the DUST SCREEN COMPANY, of Forest Gate, E. The inventor is a motorist who, having experienced the dust nuisance, has applied himself to its mitigation. The screen is of sailcloth on an aluminium framework, which opens and closes like a fan. It is fitted on the door of the car by thumbscrews, so that no obstruction is placed in the way of entering or leaving the vehicle, and when seated the straps are fixed to the studs at the side. The screen thus open is at such an angle as not to interfere with the view or obstruct the wind, while preventing any dust reaching the passengers. A small nickel plate on the top of the door and the two studs on the side of the car are the only permanent fixtures, the screen folding up, when not in use, to a length of 38 in., and a width of about 4 in., the weight being only 5½ lbs. The screen can be fixed in less than a minute, and extended in a few seconds, and may be regarded as one of the useful novelties of the Show.

Mr. F. C. BLAKE, of Kew Gardens, S.W., generally has an interesting display, and this year is no exception to the rule. We first examined a 12-h.p. four-cylinder petrol motor; the cylinders, which are cast in pairs, are 90mm. diameter by 102mm. stroke, the normal speed being 900 revolutions per minute. Among the details of the engine which are worthy of inspection are the large bearings on the crank shaft, and the inspection doors in the crank chamber. A two-cylinder engine of similar design and dimensions is also shown, this developing 7-h.p. at 1,000 revolutions. Engineering visitors to the Show will be interested in the parts of a 60-h.p. four-cylinder motor Mr. Blake is building for use on a schooner. This has cylinders 135mm. diameter by 160mm. stroke. The Blake electric ignition distributor for four-cylinder motors is well worthy of inspection. Without drawings it would be difficult to describe this device, by means of which only one coil is necessary for the sparking of a four-cylinder engine. Among Mr. Blake's other specialties are a new high-speed trembler induction coil (Emmerson's), sparking plugs, water and petrol tanks, radiators, etc.

Gas engines by some of the leading makers are shown, Messrs. CROSSLEY BROTHERS having engines of the "P.E." and "R." types, the former being a high-speed electric lighting gas engine capable of developing 18-h.p. as a regular working load. The NATIONAL GAS ENGINE COMPANY, Limited, show their well-known engines; the Stockport gas engine is on the stand of Messrs. BILBIE, HOBSON AND CO.; and the FORWARD ENGINEERING COMPANY have also their 2½, 6 and 7-h.p. Forward engines on view.

(To be continued.)

IMPORTS OF MOTOR-CARS, MOTOR-CYCLES, AND PARTS THEREOF.

BELOW we publish our official list of the imports of motor-cars, motor-cycles, and the parts thereof, into the United Kingdom during the month of January, 1903.

BELGIUM.

				£
Antwerp	London	Motor cars	4	625
"	Harwich	"	4	460
Ghent	London	"	—	195

Total imports from the United States in January, 1903 ... £12,484

ONLY eighty gallons of petroleum spirit were imported into this country during February last, as compared with 688,240 gallons in the preceding month.

THE Holderness Motor Company, Ltd., has been registered with a capital of £10,000. The first directors are Messrs. R. J. Jackson (chairman), R. D. Bradford, and J. M. Wilson.

CORRESPONDENCE.

THE OLDSMOBILE CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have had for the past three months an "Oldsmobile," and ridden it every day. After putting in a new coil, with Charpentier trembler. I have had not the slightest trouble, and have driven it a few hundred miles. Last Friday I drove it to London, including stops, in seven hours, and back on Sunday to Cheltenham in about the same time. The petrol consumption was about one gallon for thirty miles, and I could have driven all the way (100 miles) on one tank of water, but put in some two quarts, which was not needed. The good points of the little car are quick starting, always ready, a good hill climber, and non-slipping. The speed on good roads is about eighteen miles per hour. It is an ideal car for one who only wants ease and comfort in travelling. I have no interest in writing this but to let those who want a good, cheap car know of my experience.—Yours truly,

H. FERNALD.

THE NUMBERING QUESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a Club member of four years' standing, I wish, with your permission, to offer an emphatic protest against Earl Russell assuming that he voices in any degree the sentiments of the provincial members of the Automobile Club, when showering acrimonious abuse on our hard-working committee.

His Lordship, in his strange letter of March 13th, which appeared in your last issue, launches many curious charges against a body of gentlemen who have managed, with singular ability and success, the affairs of the Automobile Club of Great Britain ever since the introduction of the motor-car into this country. If a ballot were taken, as he suggests, to decide between himself and the "domineering oligarchy" at present directing our fortunes, the democratic Earl would possibly be surprised at the extent of the support he fancies he possesses.

I have not yet had an opportunity, during the hunting season, of learning the views of a single member of our governing body, but, in my humble opinion, carrying some means of identification is preferable to being summoned and fined £10 by nervous J.P.'s as often as we place our bonnets beyond the protection of our lodge gates.—Yours truly,

EDWARD KENNARD.

P.S.—I am the owner of "Sir Charles," and "Charles II.," by which names my cars can be easily identified.

CHAINS AND LIVE AXLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the correspondence which is now taking place in the *Journal*, in which I take a great interest, there seem to be one or two things overlooked. Firstly, we are constantly having illustrations of what engineers have done for many years imported into motor-car manufacturing, and although in many cases this is correct, in many others it has no bearing; for instance, the fact is forgotten that where bevel gearing is mostly used in engineering it is driven by a stationary engine on a firm bed and the transmission of equal firmness, which is altogether different from a car that is driven by an engine which varies in horse-power every mile and is by no means regularly run, more wear and tear necessarily consequently resulting.

Taking the pros and cons of the two transmissions, we must firstly not forget that the motor and the road are the prime factors to be considered, and the easiest transmission from one to the other is the one that we require in motor-car construction, and from an engineer's point of view the divided or serial transmission is the desiderata. In the chain principle we first of all conduct the drive from the engine to the countershaft and differential gear, thus carrying the transmission with its first work half way on to a fixed object that is not affected by any road vibration and is coupled direct to the engine. The power is then transmitted from this point direct to the road by chains, of which there is nothing better to take up vibration and also to counteract any erratic action of the first drive. In the Cardan principle we are deliberately taking the transmission from the motor at the front to the differential gear in the centre of the axle at the rear of the car and then transmitting to the road through the wheels some two feet each side from the centre of the axle and drive. This seems a great loss of power independent of any weakness. The differential was invented for the balancing of the car, but in the Cardan principle it is not only used for driving purposes but also has to take up the greater proportion of the weight of the car, whereas in the chain principle it suffers very little inconvenience from the drive, and certainly carries out its balancing object independently and bears no weight whatever.

I now come to the reliability portion. The majority of the purchasers of motor-cars are certainly not engineers, it is therefore advisable to give them not only something they can see, but can repair, if necessary. Consequently if a chain stretches or breaks this can be attended to by the roadside, but if anything happens between the gear box and the differential of the Cardan principle it means a workshop job. There is a certain amount of wear which must necessarily follow in both drives—in the chain system the chain

stretches and is easily adjusted; whilst in the Cardan principle there is very little adjustment (and certainly absolutely none in most cars) consequently the wear has to be taken up by a sag in the differential, hence the reason for the wheels closing inwards at the top in most cars on this principle.—Yours faithfully,

SYD. D. BEGBIE, A.M.I.M.E.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—“Jack-in-the-Box” seems to have lost sight of the fact that many cars use the bevel gear to drive the shaft carrying the sprocket for the chain. I believe all, or nearly all, cars have some form of gear in addition to the chain to transmit the power from a longitudinal to a transverse shaft. Surely the extra friction thus produced is greater, or at any rate as great, as the friction produced by a direct drive on a live axle using bevel gear only.

I have often wondered why the engine of a motor-car should not be placed so as to produce a transverse drive, and so do away with bevel and such like gears altogether?—Yours truly,

H. G. L. A.

TO EPPING FOREST.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In the “Comments” in last week’s issue you allude to the wretched roads leading out of London eastward towards Epping Forest. I reside at the commencement of these sylvan glades, and very often drive my car into the City. There is an alternative route via Bishopsgate, Bethnal Green Road, Approach Road, through Victoria Park, Hackney Marshes, Temple Mills, Leyton High Road, and St. James’ Lane, which leads into the Forest at Whips Cross Road.

This route would be far and away the best out of London for all these parts but for one half-mile. I refer to the road across the Marshes. Not only is it worse than any track across fields that one can possibly imagine, but, to crown all, there is a toll to pay of 2d. for all vehicles. Even the cyclist has to disgorge his penny. Fancy a toll-gate within gunshot of the City, and a cart track that beggars description within shouting distance of the London County Council.—Yours faithfully,

H. H. SUMMERS.

ALLEGED BREACH OF CONTRACT

MR. JUSTICE CHANNELL has had before him in the King’s Bench Division the case of *Musman v. the London Motor Garage Company, Limited*. The action was brought to recover £210 money paid as deposit for the purchase of a Lanchester motor-car, and for damages by reason of alleged non-delivery according to contract. The defendant company did not admit the contract alleged. They denied any breach of any contract if one was made, and pleaded that the plaintiff himself had rescinded and by letter given instructions that the delivery of the car should be postponed. During the course of the proceedings, counsel having consulted, it was announced that the case was settled. The terms were not stated.

CLAIM FOR ELECTRIC MOTORS.

BEFORE Mr. Justice Wright, in the King’s Bench Division, the case of *Marryat and another v. Anti-Vibrator, Limited*, has been heard. This was an action brought by Messrs. Marryat and Place, electrical engineers, Hatton Garden, E.C. against the Anti-Vibrator, Limited, of Croydon, to recover £171 in respect of work done and damages for alleged breach of an agreement. The defendants denied liability. In the early part of 1902 the defendants required some electric motors for cars which they were constructing, and they entered into communication with the plaintiffs. In May the plaintiffs came across some motors which were being manufactured at Brunswick, in Germany, and they alleged that after some negotiations the defendants ordered twelve of these motors, two to be delivered in a month and the remaining ten at the rate of two a month. Two were delivered to the defendants, and certain work was done to the other ten before the order was countermanded. The plaintiffs contended that they were entitled to £66, the price of the two motors delivered, £44 in respect of work done in connection with the undelivered motors, and £45 for loss of profit. The defendants alleged that the motors would not fit their cars, and they were not in accordance with contract, and that therefore they were entitled to reject them. Mr. Justice Wright, after hearing the evidence, found for the plaintiffs for the value of the two motors, and for the defendants with regard to the other ten. The plaintiffs were allowed £20 costs.

DAMAGES AGAINST A MOTORIST.

J. C. BARTON obtained £200 damages from Valentine G. New, of Evesham, at Birmingham Assizes, on Saturday, for injuries sustained in a motor-car accident. Plaintiff, a man of seventy, was crossing a road when the defendant, who, it was alleged, was driving a motor-car at twenty or thirty miles an hour, ran into and severely injured him.

MOTOR-CAR ACCESSORIES.

H. A. PERRY, of Brighton, sued E. Elliott-Pyle, of Hove, for £4 5s., or the return of certain accessories to a motor-car. The plaintiff bought a car from the defendant and claimed the pump, jack, horn, and box of tools which were on the car when he purchased it, but for which he alleged inferior articles were substituted. Defendant said he told the plaintiff that all the accessories in the car did not belong to it, and that he would get him others rather than have any trouble about it. His Honour found for the plaintiff for the amount claimed.

NEGLIGENT DRIVING.

JUSTICE DARLING has heard a case in which Thomas Broadbent, Birmingham, sought to recover damages from E. L. Jacobs, of The Rookery, Handsworth, for personal injuries and injury to a horse by, as alleged, the negligent driving by the defendant of a motor-car. After a long hearing the jury found for the plaintiff, with damages £30. Judgment was entered accordingly.

REFUSING TO STOP.

At the Bulmer East Petty Sessions, at York, C.A. Midgley, the electrical engineer to the York City Council, has been summoned for refusing to stop his motor-car when requested by the driver of a restive horse. The complainant, Mr. J. Wood, of Brandsby, was driving a pony which had never seen a motor-car, and as the defendant approached he pulled up, while a gentleman held the pony and held up his hand to the defendant to stop. Defendant was alleged to have refused to stop, and drove on at a high speed. The pony reared, and then smashed the cart and fell to the ground in terror. Mr. Crombie, for the defence, said that the defendant never saw Mr. Wood put up his hand. The defendant was fined £5 and costs.

SEQUEL TO A TEST RUN.

THE record has been closed by Lord Kincairney, in the Court of Session, in an action by Components, Limited, Bournbrook, Birmingham, against the Edinburgh and District Tramways Company, Limited, to recover the sum of £500. On the morning of Thursday, August 21st, 1902, one of the pursuers’ cars started from the G.P.O., Edinburgh, at 3.30, in charge of Charles Sangster, managing director of the pursuers’ company. Mr. Sangster was accompanied by an official timekeeper of the A.C.G.B.I., the intention being to drive from Edinburgh to London to test the reliability of the car. When opposite Carlyle Place, London Road, the car came into collision with the projecting solid iron doors of one of the tramway manholes in the middle of the street, which are said to have been standing open. The market value of the car was not less than £750, and the pursuers say that the sum sued for—£500—is a moderate estimate of the loss they have sustained by the collision, which is said to have been caused by the fault of the defenders in failing to have a lamp placed at the manhole, and a man to warn approaching vehicles of the danger. The defendants deny fault. They say that only one of the doors of the manhole was open, and that the car was, contrary to statutory regulations, travelling at the rate of about twenty miles an hour, and was being recklessly driven. The accident, it is maintained, was materially contributed to by the negligence of the driver of the car in failing to keep a proper lookout, and by the excessive speed at which he was driving. In another action Mr. Sangster, the driver, sues for £50 damages for personal injuries which he sustained in the collision. Issues have been ordered for the trial of both actions.

A MOTORIST DISCHARGED.

At the Leeds Assizes, on Saturday, before Mr. Commissioner Lawrence, the two days’ trial of Haydn Lee was concluded. He is an engineer student at the Yorkshire College, and was charged with the manslaughter of Arthur Thackray, a tramcar conductor employed by the Leeds Corporation. On December 12th, Mr. Lee was driving a motor-car, when, on a steep incline in Headingley Lane, Leeds, the car knocked down the conductor of a tramcar, dragging him for some distance and causing his death. Witnesses varied in their estimate of the speed of the motor-car from eleven to twenty-five miles an hour. Some of them did not hear a horn blown by the motorist. The accused, who called many witnesses to support his statement, said he was not driving at an excessive speed. He was found not guilty and discharged.

AN ECHO OF “LE PASSE PARTOUT.”

DR. LEHWESS, of 66, Holland Park Avenue, Notting Hill, was summoned on Tuesday, at Marlborough Street Police Court (London), for exhibiting an advertisement in Hyde Park in April, 1902. The defendant was starting on his automobile tour, and was seen by Constable Mungo-Park, A Division, with his “caravan,” proceeding through Hyde Park. The cars bore the words “Passe-partout,” which the defendant contended was a fanciful name for the car, and in no way advertisements. Dr.

Jehwess produced photographs of cars. Mr. Denman said he did not think this was an advertisement. There was no statement of "This" style £1,000," or anything of the kind. The summons would be dismissed.

CARRIAGE BUILDERS' LIABILITY.

At the Southwark County Court, on Monday, Judge Addison, K.C., gave judgment in an action in which Montague Napier, trading as D. Napier and Son, of Vine Street, Lambeth, sued Messrs. Bayley, Limited, of Newington Causeway, to recover £45 8s. 10d. damages for breach of contract. The plaintiff's case was that they had an order from a customer for a motor trolley for £750, and they put out the whole of the body work to the defendants to make for £225. The body was delivered, and the motor having been fixed by the plaintiffs, they sent it out with a load of five tons evenly distributed for its hill-climbing test at Dashwood Hill. The trolley had, however, been out only a few hours when the near hind wheel became hot, and although plenty of oil was poured into the grease chambers it "seized" and brought the trolley to a standstill. A local firm of engineers had to chip the axle-box off the axle and had to supply a new axle and pair of wheels, the former being made of gun metal. The old one with the axle-boxes was composed of cast steel, and it was contended that, the casting being faulty, the hub of the wheel cracked, threw it out of gear, and thus caused the wheel and the axle to become grooved and to "seize." In addition the grease channels were faulty, and the grease was consequently prevented from getting round the axle. Much evidence was given on behalf of the defendants to show that the work was well and properly done, and that the trouble was caused through the plaintiffs not properly removing some grit from the axle-box. After a hearing which lasted two whole days, his Honour took time to consider his decision. In the course of his judgment he said that the whole case narrowed down to the fact that the grease channels (which were a thirty-second of an inch wide) were not large enough to allow the grease to properly lubricate the wheels. That was a structural defect for which Messrs. Bayley were liable, but no possible reproach could be cast upon them because of that. He was obliged to find for the plaintiffs, and he put the damages as low as possible, namely at £35. He hoped that the two firms who had had to suffer for a thing that was still in its infancy and in an experimental stage would make up their differences and not allow that case to interfere with their business relations. Judgment was entered for the plaintiffs for £35 and costs.

FURIOUS DRIVING CASES.

COURT.	DEFENDANT.	ALLEGED SPEED.	RESULT.
Newbury	A. Bennett, Newbury	—	10s., etc.
Southport ...	R. Colgate, Birmingham	—	20s., etc.
Marlbo' St. London	A. Gentili	—	Remanded.
Brighton	F. Muhlenkamp, Brighton	—	£5, etc.
"	H. Maffert, London, N.	—	£3, etc.
Horsham	Hon. C. S. Rolls	30 m. p. h.	£2, etc.
Nottingham ..	G. Hart, Nottingham	21 m. p. h.	30s., etc.
Arundel	Mrs. E. Wigley, Kingston Hill	19 m. p. h.	Dismissed.
Tunbridge Wells	A. E. Waddington, Frant	25 m. p. h.	£2, etc.
"	P. S. May	22 m. p. h.	£1, etc.
"	H. O. Hall	—	£1, etc.
Shoreham ...	J. Spicer, Chippingham	—	£5.
Horsham	W. Robinson, Clapham	26 m. p. h.	40s., etc.

Where no alleged speed is given it is understood to be above the legal limit.

ALBAN GENTILI, a motor-car driver, of French nationality, was charged, before Mr. Denman, at the Marlborough Street (London) Police Court, with furiously and recklessly driving a motor-car in Hyde Park, and causing serious bodily harm to William Smith, of 11, Harleyford Street, Vauxhall, S.E. After hearing the police evidence, Mr. Denman remanded the prisoner, remarking that it was not the first case of the kind that had come before him. Bail was allowed in two sureties of £50 or one of £100.

At Horsham, on Saturday, the Hon. C. S. Rolls was fined £2 and 6s. costs for driving a car at an excessive speed at Ifield on March 8th. The police evidence was that a quarter-mile was covered by the car at the rate of thirty miles an hour. Defendant wrote to the magistrates that it was only the second time in his experience that he had been stopped. The first occasion was before 1896, for not carrying a red flag in front of his automobile.

On Thursday week, Mrs. Ellen Wigley, of Brunswick Road, Kingston Hill, London, was summoned for driving a motor-car at Arundel at a greater speed than twelve miles an hour—to wit, nineteen miles an hour. Police evidence was that a third of a mile was covered in one minute 2½ seconds. In the course of cross-examination, Mr. Staplee Firth asked the

constable if he liked the occupation of catching motorists, when the following discussion took place:—The Chairman: You need not answer that question. Mr. Firth (to the Chairman): It seems that, instead of hearing the evidence, you are acting as prosecution. The Chairman: We cannot allow gentlemen to come down from London and ask our constables whether they like the occupation. Mr. Firth: I am entitled to cross-examine. I have had several cases where it has been shown there has been too much bias and eagerness on the part of constables—where they have overshot the mark. I have been practising before the Justices of the High Courts for fifteen years, and I ought to know what I am talking about. After the speech of Mr. Firth the Chairman announced that the case would be dismissed, remarking that the Bench found some difficulty in deciding in this instance. They were not quite clear whether the car was going nineteen miles an hour, and, therefore, gave defendant the benefit of the doubt.

MOTORISTS travelling between Romford and Brentwood are warned that the police are on the look-out for too-speedy motorists, the telephone being freely used between the two places.

THAT Mr. Gardner D. Hiscox's treatise on "Gas, Gasoline and Oil Engines" has become a standard work is evidenced by the receipt from the publishers—Messrs. Sampson Low, Marston and Company—of a copy of the tenth edition. Mr. Gardner is an American engineer, and therefore it is not unnatural that the motor productions of the United States should receive the principal share of his attention. There is, however, much in the book which will be found useful to all desirous of obtaining information with regard to the principles underlying the internal combustion motor. After dealing with that theory, the author discusses the question of retarding combustion and cylinder cooling, the causes of loss and inefficiency in explosive motors, silencers, governors, lubrication, engine testing, etc. These are only a few of the subjects, taken at random, dealt with, but they are sufficient to show the exhaustive character of the work.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, APRIL 4, 1903.

[No. 213.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

IN the House of Commons, recently, Sir W. B. Gurdon moved the second reading of a Bill which declared in its main enacting provision that "every innkeeper shall supply the reasonable demands of every traveller for board, lodging, refreshment, and other accommodation of a like nature, if he has at his disposal accommodation of the nature and character demanded." It is the law at the present time that an innkeeper is bound to supply "reasonable refreshments" to anyone calling for them; but, according to Sir William Gurdon, it is no uncommon thing for the law to be set at defiance, and for innkeepers to be so absorbed in the serving of drink as to neglect the supply of food altogether. Moreover, the process of bringing to book a licensed victualler who will not serve victuals is cumbersome and expensive. Under this Bill a landlord not providing food can be brought up before a court of summary jurisdiction and fined £2 for a first offence. With the provisions of the measure motorists will be found in cordial agreement.

After the Show.

Now that the Automobile Show at the Agricultural Hall, London, has come to a close, it can be pronounced a complete and unqualified success. The exhibitors practically without exception reported a large attendance of the most desirable class of visitors during the whole week, and many sales were made, while at the same time much good seed was sown that will ripen in the future. The public were well satisfied with what they saw, and they could hardly be otherwise. The exhibits showed that many of the crudities and mechanical faults in the vehicles exhibited only a few months ago had been eradicated in the interval, and that the watchword of the manufacturers during 1902 had evidently been: "Good automobiles first; then cheap automobiles." This policy is certainly an excellent one, and one which if adhered to in the future will make the British automobile the standard of the world and ensure its complete success at home.

Orders Taken at the Motor-Car Show.

BUSINESS of a satisfactory character was reported by exhibitors at last week's Automobile Exhibition, said the *Daily Telegraph* on Monday. "The chief demand was for light cars, at prices in the near neighbourhood of £500, and a representative of a French firm making a vehicle of high reputation stated that he had secured orders for forty of them, while other exhibitors returned their sales at £5,000 to £10,000. A leading firm of agents sold eighty cars during the show, and as most of them were of a big and expensive type, their value would not be far short of £50,000."

Trial Trips.

THE experience of most of the exhibitors was that the visitors demanded to be shown and have explained the operating principles of the machines, and with few exceptions firms had made provisions to meet this demand. On nearly every stand was shown at least a chassis and sometimes also separate engines, transmissions and other parts. The rule prohibiting the use of petrol in the building prevented machines being shown running under their own power, but advantage was taken of the streets in the locality for giving likely purchasers an opportunity of judging of the way in which cars can be controlled in traffic, a practical test appealing to inquirers far more strongly than merely manoeuvring in enclosed grounds.

An Inaugural Run.

THE first run of the Wolverhampton and District Automobile Club took place on Saturday last, the destination being Newport. En route members made a brief stoppage at Wrottesley Park. The captain of the day was Mr. W. G. Owen, who drove a 10-h.p. Wolseley, and there were also present:—Messrs. O. Evans, G. Evans, F. W. Bayliss, F. C. Bishop, H. Lewis, Davis, Birbeck, S. R. Rhodes, Stratton, Dark, Cureton, Pullinger, H. L. Laurie, Trusselle, Dixon, T. Mills, Captain Haden, E. Lisle, jun., Herbert. The motor cars carried with them, as passengers, thirty-nine members and visitors.

Educating Road Surveyors.

THE Lincolnshire Club has had a happy inspiration in inviting all the road surveyors of the county to lunch at the Faracen's Head Hotel, Lincoln, on the 16th inst. This will take place at one o'clock, and the members of the Club will be expected to take the local road surveyors from their districts and to take them home again. Vacant seats are to be offered to personal friends whose interest may be useful to the movement. Mr. W. Garfit, M.P. for Boston, will preside, and Mr. Rees Jeffreys will read a paper.

Automobilists and Cabmen.

WHILST Mr. Mark Mayhew, L.C.C., was driving his motor-car along the Victoria Embankment a few days ago, he overtook a hansom cab, the driver of which was towards the middle of the road on his wrong side. It was therefore necessary for Mr. Mayhew to sound his horn in order to warn the driver of the hansom of his approach. Having done this he drew alongside. The cabman thereupon commenced using most abusive language to the motorist, who told him that if he (the cabman) did not withdraw the offensive language which he had used towards him, he (Mr. Mayhew) should take steps to punish him. Upon this the cabman became still more abusive. Mr. Mayhew then called a policeman, whom he requested to take the cabman's number, name and address. At the police court Mr. Staplee Fifth appeared for the prosecution, and after the case was heard the magistrate fined the cabman

the full penalty, namely, 40s. and 2s. costs, or 21 days' hard labour. Mr. Mayhew is to be thanked for having taken this step in the interest of users of the road, and it is sincerely hoped that it will have the effect of checking the annoyance to which automobilists are so frequently subjected by some of the London cabmen.

The Carriage of Motor-Cars by Rail.

THE general council of the Scottish Automobile Club is bringing this subject under the notice of the railway directors north of the Tweed. The charges made for the carriage of motor-cars are high, and as they appear to be uniform, they are specially hard upon owners of small types of cars. The owner of a car costing £150 is called on to pay as much for railway carriage as the owner of a car costing £1,500, which may weigh three or four times as much as the former. When a motor-car is railed at least one person is likely to travel with it, but as matters now stand owners often put themselves to some inconvenience to go by road. At present the high rates in Scotland induce owners to send their motor-cars by sea whenever that is possible, but this is a means of conveyance which they would gladly avoid if the railway rates were more reasonable. Thus a motor-car sent from Paris to Edinburgh—rail to Dunkirk and ship thence to Leith—costs £3 for a small one and £5 for a large one. Freight by sea from London to Leith on a small car is only 14s. Any size sent by rail from London to Edinburgh costs about £10.

A New Motor Mail Cart, built by the Eagle Motor and Engineering Company, and adopted by the G.P.O. authorities for the rapid transit of Letters in the Metropolis. [Photo by] Bassano's, Ltd.

A Comparison.

THE French railways recognise the motor-car as a powerful competitor, and therefore use every effort to encourage owners to send their cars by train. Not the least attraction which they hold out in this respect is very low rates for carriage. From Paris to Boulogne (160 miles) the charge by rail is only 27s.; and by that route a car weighing over 1½ tons can be brought from Paris to Edinburgh at a cost of under £10. It is needless to multiply instances to show that, while in France every inducement is given to encourage an owner to rail his car whenever this is more convenient to him, in this country the high rates of carriage are largely prohibitive. There are many occasions on which, on account of the weather, condition of roads, early starts, or long distances, automobilists

would find it convenient, if any inducements were offered, to make a more general use of the railways for the transport of their cars and of themselves and their friends, than they do at present.

Club Runs.

ON Saturday the Western Section of the Scottish Club had the first run of the season to Ayr, and, despite the discouraging weather, a pleasant time was spent. Fifteen cars—comprising three Belsize, five Daimler, two Wolseley, and representatives of the Panhard, Clement, Argyll, De Dion and James and Browne cars—attended the opening run of the Manchester Club to Congleton on the same day.

Automobilism in Malta.

THE American Consul at Valetta has recently prepared a report on automobilism in Malta, from which we take the following:—Manufacturers of automobiles should bear in mind that Malta does not possess, as a rule, long, level stretches of road. There are many steep hills—some of them having a gradient of 1 in 9. Vehicles should be much more powerful than is the rule in the United States. When possible, it is better to give prices c.i.f. Malta. If information as to the cubic measurement of the vehicle as crated or boxed for shipment can be given, it will add to the satisfaction of the purchaser. There are already several cars in use, and correspondence is now being carried on between probable purchasers and makers. One firm desires to secure large vans for the delivery of goods. No fault is found with petrol cars except that it is somewhat difficult at times to procure petrol on account of local laws.

No Petrol.

PRESSMEN often have a strange feeling of sympathy with the drivers of motor-cars when indulging in runs for the purpose of literary reference. The anxiety of the manufacturer or agent to see that everything is in order, that the rugs are in position for the comfort of the journalist, and the general scrutiny of the car that always precedes the mount, is interesting. Such incidents are necessary, especially when the carelessness of the average attendant at the garage is considered. We remember once having such a trial run, and when we had gone about a couple of miles the engine slowed down and stood still and silent amid the hustling traffic all around. The petrol tank was empty—the filling of that receptacle being such an ordinary commonplace experience that preliminary questions on the point had been discounted as unnecessary. But it is the unexpected that happens—in automobilism as in other things.

Local Authorities and Automobiles.

COUNTY surveyors and others frequently engaged in tours of inspection or enquiry are finding the automobile a great convenience, and last week several leading men engaged in municipal work were among the visitors to the show. Among these was Mr. J. A. Brodie, the city engineer of Liverpool, whose Council is considering to allow him an annual sum for providing and maintaining a motor-car for his use in lieu of the present allowance for horse hire. The chairman of the Main Roads and Bridges Committee of the Lancashire County Council, Mr. W. B. Hulton also makes frequent use of an electric brougham when making journeys in the public interest.

Engineers and Motor-Cars.

COMMENTING on Captain O. O. Longridge's recent paper at the Institution of Mechanical Engineers, the "Engineering Magazine" remarks that it is interesting to perceive how the motor-vehicle has become one of the most important subjects for discussion among engineers, thus forming at the same time a matter for science and for recreation. Ultimately there is little doubt that the motor-vehicle industry will take its place as one of the great manufacturing occupations of the industrial world.

ranking with locomotive and steamship building, since the machine must supersede the animal over the entire world. It is well, therefore, that it has thus early come into the hands of the engineer, and that he will prove equal to its solution no one can doubt.

Some Little Refinements.

WITH most of the new models now before us, it seems a pity that attention is not given to little refinements. A tap at the bottom of the carburettor is an addition found on very few cars, but what a useful addition it is—the carburettor floods, you empty it, without taking any pipes down, or taking any part of the carburettor to pieces; dirt or water finds its way into the petrol; empty the carburettor by the tap, and make a fresh start. A little refinement like this is better appreciated when the trouble occurs in the dark, as it very often does. Again, how many cars are fitted with a petrol gauge?

railway trains. Possibly the idea is one that will find approval by the police authorities, and may yet be used in evidence against motorists.

What of the Future?

WE shall perhaps be using a commonplace if we remark that the automobile of 1903 is a far more gainly-looking construction than was that of any preceding year, and a dozen times more acceptable in design than was the automobile of motor-car emancipation year, 1896. Thus comments the "Electrical Review," in the course of an article on modern automobiles, from which we take the following extract: "Six years' exercise of inventive ingenuity, together with six years' careful attention from the coach-builder and the motor-equipment manufacturer, have worked marvels. Who shall say what the next six will accomplish? We falter when we touch this phase of the subject, for electrical progress is sometimes given to

Photo by]

The "Star" Gordon Bennett Racer leaving the Agricultural Hall. (See page 85.)

[Argent Archer.

There is nothing more annoying than to be uncertain as to the quantity of petrol in one's tank, and how very simply the difficulty can be avoided! A very useful addition to a modern motor-car, in fact it is almost a necessity, is a little four-volt lamp with flexible wire. It serves a double purpose; it will tell you if your batteries are low, and it will enable you to effect little adjustments at night time, with ease, comfort and safety. The *tout-ensemble* of motoring is good, but little refinements make it better.

Gauging Velocity.

A RUSSIAN engineer named Liotshak is said to have invented an ingenious apparatus capable of recording with absolute correctness the velocity with which a train is travelling at any period of the journey. The Tsar manifested a lively interest in the device, and the Russian Railway Ministry has ordered 1,000 sets of the device for adoption on the

springing surprising developments upon us; we believe, however, that all electrical engineers whether in England, America, or on the European Continent, are of opinion that the advantages which steam and petrol cars now possess over the electromobile will by that time, if not earlier, have come over to their side. And if that should happen, what a mighty work there would be before electrical engineering! But we will not indulge in grandiose prophesying or roseate forecasts, for in this matter we own to being upon even less certain ground than our meteorological authorities are in theirs.

"Motorobesity."

"PUNCH" pictures a club-man, after nine years' absence at the other end of the world, returning to town and meeting several old friends much expanded in form and some of immense girth. One thus explains the change:—"You see, it's like this. For ten years or so everybody who could afford a

motor of some sort has had one. We've all had one. Not to have a motor has been simply ridiculous, if not disreputable. So everybody has ridden about all day in the fresh air, never had any exercise, and got an enormous appetite. Besides, in the summer we've always been drinking beer to wash down the dust, and in the winter soup, or spirits, or something to warm us. My dear fellow, you can't think what an appetite motoring gives you. I had an enormous steak for my lunch at Winchester to-day, and a great lump of plum cake with my tea at Aldershot, and my aunt, the General's wife, made me bring a bag of biscuits to eat on the way up, and yet I'm so hungry now that I should feel quite uncomfortable if the thirst those biscuits, and the dust, gave me didn't make me almost forget it. I suppose everyone is really getting fat. One notices it when one does happen to see a thin fellow like you. Why, in all the Clubs they've had to have new arm-chairs, because the old ones were too narrow."

The Speed Limit of Motor-Cars.

THIS is one of the most important questions of the day, not only to the engineer, who may, perhaps, look at the subject from a too personal point of view, but to the general public who are technically interested in the development of the engineer's ingenuity. It is, perhaps, in the interests of the motor-car industry itself that the speed limit of the vehicle and the qualifications of the drivers should be put upon a legal and a common-sense basis. The present twelve-mile-an-hour limit—a figure combining a maximum of annoyance with a minimum of usefulness—is palpably as absurd a restriction for a quiet country road as it is highly impracticable or dangerous (under different conditions) upon the very same highway. Such is the view of the official organ of the Engineering Society in connection with the new Birmingham University. The problem is rather confined to the driver than to the car, for a badly driven car at six miles an hour is more dangerous than a skilfully manipulated one at sixteen. It will not be long before the hiring of motors will be as common a practice as the hiring of landaus—imagine the ordinary 'Arry out on his motor! Against all this we have the suggestion of Mr. H. C. Wells, brought before the University of Birmingham by Sir Oliver Lodge at the beginning of the year, and approved of by practical engineers, to construct a great motor highway from London to Scotland, suitably arranged with electric supply stations, and restricted to pneumatic-tired vehicles. There is then no reason why the power of the machine should not be the only limit to the speed attained. "More convenient, but less economical," might be Professor Burstall's comment to the suggestion of subdividing the power into smaller isolated limits, and though this is true, yet the business man of to-day will sacrifice anything to save time and to suit his convenience.

The Death of Count Zborowski.

A FINE sportsman and a popular gentleman was Count Zborowski, whose terrible death at Nice on Wednesday has sent a shudder through the automobile world. Only a few days ago Mr. S. F. Edge told us with evident pleasure that the Count would drive an English car in the Eliminating Race for the Gordon Bennett contest, and British motorists were hoping that he might help them to sustain the national credit. But alas! on the fourth day of the Nice fetes he was killed instantaneously in the hill-climbing race from Nice to the heights of La Turbie, overlooking Monte Carlo. Two years ago Bauer was killed in an accident at a spot a few feet from where Count Zborowski's fatal spill occurred. The road, which rises continuously in a steep gradient for a distance of nearly ten miles, is a most dangerous one, presenting a constant succession of winding curves and sharp bends. At the first bend in the round the Count's Mercedes car skidded, and failing to take the curve properly, went bounding on in the straight. It dashed at a speed of over sixty miles an hour into

a great boulder on the roadside. Count Zborowski and his mechanic were thrown violently, the former falling on his head, and he was quite dead when picked up. The mechanic, Pallange, who expired shortly after, was still breathing, though fearfully injured, when the bystanders rushed to the fatal spot. About the same time, the car of the Baron de Gasteaux, owing to the breaking of a chain, was dashed on the rocks at the Montee du Pin. The Baron and his mechanic were thrown to the ground, but escaped with slight injuries.

A Popular Sportsman.

COUNT ZBOROWSKI was the son of an American who married a Pole, and was born in New York about forty years ago. For several seasons he hunted in the Midlands, residing at Coventry House, Melton Mowbray, and being distinguished as a bold rider to hounds. Last year he was fourth in the heavy-car class of the Circuit des Ardennes, his time for the 318 miles being 6 hr. 52 min. 16 sec., giving an average of 46½ miles per hour. In the Paris-Vienna race he accomplished the actual fastest time in the contest, covering the 615½ miles of roads, which were exceedingly difficult during the later stages of the contest, in 15 hr. 37 min. But he lost 36 min. because his papers were not in order, and the Austrian customs officers compelled him to stop and pay duty on various articles at the frontier. Everyone will regret this sad termination of the career of a popular sportsman.

Easter.

OWING to the Easter Holidays, *The Motor-Car Journal* will go to press a day earlier than usual next week, and correspondents are requested to send their contributions not later than first post on Tuesday morning. The same request also applies to the business departments, and "copy" for advertisements should reach the office during Monday, or at the latest, by first post on the 7th inst.

TRIALS of a motor car, with a body built as a mail van, were made at Yarmouth on Tuesday.

MR. PERCIVAL SPENCER promises to produce by Whitsuntide, a flying machine that will be a distinct advance in aeronautics.

THE Yorkshire A. C. is having a tour in the Lake district at Easter, making its headquarters at the Stag's Head Hotel and the Old England Hotel, Bowness.

THE Electric Light Committee of the Eastbourne Corporation are recommending the Town Council to hire two Milnes-Daimler 'buses for experimental running in the town. Should these prove successful, a municipal motor omnibus service will be inaugurated.

THE Coronet Motor Company, Ltd., has been registered with a capital of £20,000 to acquire the business now carried on by Mr. W. J. Iden, at Foleshill, near Coventry, as the Carlton Motor Company. The first directors are Messrs. J. Perkins, J. Perkins, jun., W. Perkins, and W. J. Iden.

THE Standing Joint Committee of Huntingdonshire have decided to link the whole of the police stations in the county together by private telephone for the purpose of facilitating police business, more particularly in the detection of excessive motor-driving. Last year the police obtained sixty-eight convictions against motorists.

PROFESSOR W. E. DALBY read a paper on "Vibration Problems in Engineering Science," at the Automobile Club, last week. The question of engine balancing was considered, and the effect of the disposition of balance-weights on flywheels, of the addition of pistons, and of the inclination of cranks in diminishing the vibration due to the rapid reciprocal movement of pistons and the angles of connecting rods was made clear by models suspended on springs and placed on planes and rotated by means of electric motors. The experiments proved that reciprocating weights cannot be properly balanced by the addition of revolving weights to the flywheels alone.

GORDON BENNETT RACE NOTES.

THE history of the Bill legalising the Gordon Bennett Race is perhaps a record in celerity, so far as our Houses of Parliament are concerned. Here are the leading stages in its progress:

- February 10th.—Clauses settled.
- " 20th.—Read a first time in the Commons.
- " 24th.—Bill blocked by Mr. Galloway.
- " 26th.—Read a second time.
- March 2nd.—Read a third time and went to Committee.
- " 3rd.—Passed first reading in the Lords.
- " 16th.—Read a second time.
- " 20th.—Committee stage reached and amendments made vesting the power to make regulations in the Local Government Board of Ireland instead of the County Councils.
- " 24th.—Bill read a third time.
- " 26th.—Lords' Amendment accepted by the Commons.
- " 27th.—Royal assent given.

THE Eliminating race in connection with the Gordon Bennett Cup will take place at Welbeck on Saturday,

THE only serious hill in the whole of the Gordon Bennett course is the Windy Gap, just beyond Stradbally Village. The Ballylynan-Athy road is a good stretch on the whole, but it is certainly ruined by quarry carts passing along it. These have formed deep ruts, and as part of the road is in Queen's County, and part in Kildare, the surveyors of these two counties will have to act conjointly in securing the improvement of the surface before the day of the race. About five and a half miles of the road will have to be picked up and rolled. Should this be done, however, it will be necessary to keep the quarry carts off the surface until after the race, or it will soon be ruined again.

It is probable that the Club enclosure will be on the Athy-Kilcullen Road, two or three meadows thereon having been suggested as a suitable place on which to erect the Club tent. It is probable that the road in front will be treated with tar in order that no dust may be raised. A captive balloon will be anchored near the Club enclosure of the course, and attempts will be made to take photographs therefrom.

It has been suggested that at the conclusion of the race (the finishing point of which will be the Club enclosure) Lady Dudley

Photo by]

The Gordon Bennett Course—Kilrush Hill, looking South-west.

[D. Lawrence.

April 25th, the cars being required to be on the course at 11 a.m. A new apparatus for the electrical timing of motor-vehicles will be used, and should it prove successful, will probably be introduced in connection with the Irish week. Those vehicles taking part in the Trial will have to be driven to the Club House in Piccadilly by 12 noon on Friday, the 10th inst., to be examined by representatives of the executive committee, and to have attached to their frames the seal of the Club.

MR. EDGE, as the present holder of the Cup, will be the first to start. Chevalier Rene de Knyff will then go forward on his Panhard. An American car will start third, and the fourth will probably be a Mercedes, driven by Baron de Caters. The second four to start will be Mr. Charles Jarrott on a Napier, Mr. Maurice Farman on a Panhard, the second American car, and the Mercedes driven by M. Degrais. The last four in the race will be the British car, which may be a Star driven by Mr. Lisle, jun., or a Napier driven by Mr. Mark Mayhew, L.C.C., or Mr. J. A. Holder; the Mors racer, the third American car, and the third Mercedes. The vehicles will start at intervals of two minutes, the first leaving at 7 a.m., and the last at 7.24 a.m.

may present a wreath to the winner, and souvenirs to the other competitors in the contest.

ABOUT 700 road stewards will be required for the course of 103 miles. Members of the A.C.G.B.I. who may be in Ireland in the early days of July, and who may be willing to act as stewards, are requested to send their names at once to the new secretary, Mr. J. Orde. At least five special committees will be required in connection with the various events taking place in Ireland during the automobile fortnight.

M. RENE DE KNYFF, who has just returned to Paris after a trip over the proposed route in Ireland for the Cup race, has been interviewed by the *Velo*. He is reported to have expressed the opinion that the route is not equal to that of Paris-Bordeaux or the Circuit des Ardennes. The route, which is the form of a figure 8, is good for 50 per cent. of its length, bad for the remainder, which comprises many sharp turns and *dos d'ane*, of which one is particularly disquieting. For about 40 per cent. of the distance the road is not wide enough for racing, and to pass under these conditions will need absolute fraternity among the competitor fraternity, which there is no reason to doubt will be shown by all. Asked by the interviewer if he came back from Ireland with

a bad impression, M. de Knyff replied "Certainly not. I had a hearty reception, and if the route is not perfect, it is acceptable."

MESSRS. SMITH AND SON are preparing new chronometers with ten-inch faces, fitted with second hands showing fifths of seconds, for use by the observers of the trials during the great

representing a nation which may collectively make the highest average speed in the forthcoming contest.

WE would like to remind readers of the assistance rendered by the Irish Automobile Club in connection with the forthcoming great event. Col. Chaloner Knox and Mr. R. J.

Mr. L. P. Mooers on the "Peerless" Racer—One of the American Competitors. (See page 85.)

race. Nine of the clocks will be required, and after the race an inscription will be placed upon their faces to the effect that they were the official clocks used on the occasion of the Gordon Bennett race. They will then be sold to members of the A.C.G.B.I. at cost price.

McCredy were probably the first to suggest the course that has been adopted, and Mr. W. G. D. Goff has also rendered great service in making preliminary arrangements.

At the French Automobile Club, objection is reported to

A "Napier" Gordon Bennett Racer.

(Some particulars of this car were given on page 53 of our last issue. The vehicle weighs 16 cwts. 97 lbs.)

A NEW trophy, value two hundred guineas, has been promised by Mr. Scott Montagu, M.P., as a second award in connection with the race. It will go to the team of three cars

have been taken to the hour fixed for the start of the contest, which, it is contended, should be either four or five o'clock in the morning, instead of seven. If the weather is hot, the strain

of running at high speed for nine hours will, it is urged, be too hard on the drivers, whereas by an earlier start this objection is sensibly modified.

So that there shall be no possibility of their cars suffering damage prior to the Gordon Bennett race, Messrs. S. F. Edge and C. Jarrott have withdrawn from the Paris-Madrid race.

On page 84 we give an illustration of the racing car built by the Peerless Motor Company, of Cleveland, Ohio, for the American Automobile Club's Eliminating test in connection with the Gordon Bennett race, and which will be driven by Mr. L. P. Mooers, who is seen at the wheel in the picture. The main frame is of channel steel, the motor has four vertical cylinders, while the direct system of transmission to a live axle is adopted. The machine, with its long square motor bonnet and diminutive driver's seat, presents a racy and striking appearance.

In the course of the annual motor-car exhibitions at the Agricultural Hall there has generally put in appearance at least one new car which instantly became surrounded by a large crowd of interested spectators. Many of our readers will remember the excitement in the arena caused a few years ago by the arrival of the Whitney steam car, and twelve months later by the first Wilson and Pilcher petrol car. This year was no exception to the rule, the 1903 *clou* being found in the racer which the Star Engineering Co. have built for the Eliminating Contest to be held early this month in anticipation of the Gordon Bennett race. We are this week able to publish a few brief particulars of the car, an illustration of which is given on page 81. The main frame is constructed of wood and steel, the underframe supporting the motor and gear being of angle steel. The vertical engine comprises four separate cylinders. No information is available as to the dimensions or horse power of the motor, which is water-cooled by means of a gear-driven pump, and a honeycomb radiator with fan of the Albany type. The engine, which runs at a medium speed, is controlled by a governor acting on the outlet from the carburettor. The throttle valve can also be controlled either by the hand or foot. The ordinary system of ignition by means of accumulators and trembler coil is adopted. Large bearings are provided between the cranks on the crank shaft, which is, it may be remarked, hollow. The power is transmitted through the clutch to a Panhard type of gear box, giving three speeds forward and a reverse, controlled by one lever. This drives a differential countershaft which is connected with the rear wheels by side chains. Plain bearings are adopted, while, like the crank shaft, the shafts in the gear box are hollow. The car has a long wheel base, and is mounted on equal-sized road wheels 34 in. diameter, shod with 3½ in. pneumatic tyres. Complete with two-seated racing body, ready for the road, the weight of the vehicle comes out at about nineteen cwt. The lightness of the chains and some of the other parts was somewhat unfavourably commented upon by many of the engineering visitors, but "the proof of the pudding is in the eating," and everyone is now looking forward to the behaviour of the car in the Eliminating Test. It was taken out for a short run on Saturday morning last, and, although it was not possible to get on the top speed, there was no room to doubt that on the open road the Star racer will prove a flier.

MESSRS. HUMBER, LIMITED, inform us that they have appointed the Victoria Carriage Works, Limited, 25, Long Acre, W.C., agents for the sale of their cars in London, where they will be on exhibition and trial.

AMONG the cars entered for the Paris-Madrid race is a "Spyker," which is to be driven by Mr. E. Broadbent, the works manager of the Bradford Motor Company. The vehicle will be fitted with a six-cylinder engine developing 54-h.p., a novel feature being that the power will be transmitted to all the four road wheels.

STEAM POWER FOR AUTOMOBILES.

A LECTURE on the above subject was recently delivered at the Automobile Club of America by Prof. John E. Sweet, of Cornell University, who states that he had been urged to get out a design for an automobile engine on the lines he thought most suitable. This he had done, and it was his intention to inform his audience in what respects his machine had been successful and wherein it had failed. It was his opinion that as two cylinders were required, the engine might as well be made compound, which would lead to a considerably higher steam economy. To obtain complete balance with a two cylinder engine, the cylinders of which must necessarily be set at quarters, was impossible, but a fair balance could be obtained by placing the two cylinders at right angles to each other. This arrangement had been adopted in his engine, the high pressure cylinder being arranged horizontally and the low pressure cylinder vertically. The valves employed were described as of the piston type with plain surfaces. All the working parts of the machine were enclosed and ran in an oil bath. Special effort had been made to avoid all possibility of parts coming loose. No stuffing boxes were used on the piston rods, the rods being made a ground fit in the cylinder heads. The piston rods and crossheads were made in a single piece, and the connection rod also was made in a single piece; that is, without bearing caps. The question now was how to reverse the engine. The eccentrics had been turned in one part with the crank shaft, so that they could not be shifted, which was not a good arrangement. It was then decided to reverse by interchanging the admission and exhaust passages, which would allow of backing at a slow speed. The object was obtained by means of two common plug valves, with channels cut in them, the two valves being operated simultaneously. The engine worked with a constant cut-off at three-quarter stroke, and, being well balanced, would run as high as 1,500 revolutions per minute. Tests made by Professor Carpenter had shown that the steam consumption varied between 27 and 30 pounds per horse power hour. None of the troubles they had expected had materialised, but where they had least expected trouble the engine had failed. The valves had proved entirely unsuitable for the work, and had become inoperative after only a short time of use. The reversing plug valve had been found even less satisfactory than the main valves. A vote of thanks was tendered Professor Sweet at the conclusion of the lecture.

SIR DAVID SALOMONS is contributing a series of articles on "Electrical Ignition in Gas Motors" to the "Electrical Review."

THE Earl of Buckinghamshire has recently joined the ranks of automobilists, and has placed an order for a 10-h.p. Argyll car.

THE Centre Steering Tractive Company gave a very successful demonstration last week at Hampton Court of their system by which an ordinary omnibus can be converted into a motor 'bus. The system consists in attaching an ordinary four-wheel tractor driven by steam, petrol, or electricity to any existing omnibus or four-wheeled vehicle by removing the front wheels of the vehicle and substituting for them the rear wheels of the tractor (an operation which took about three minutes in the case of the omnibus used in the trial). The transformed (and now six-wheeled) vehicle is steered by the hind wheels of the tractor. Notwithstanding its unusual and somewhat ungainly appearance, the vehicle certainly proved well able to turn round in its own length, and in other respects to be easily controlled. It has the advantage that it enables the existing rolling stock to be utilised without further expense. The tractor on view was steam driven, weighing about 2½ tons, and capable of travelling an average distance of 30 miles without a stop, at speeds up to 15 miles per hour. Steam is generated in a water-tube boiler at 250 lbs. pressure. A vertical compound reversing marine-type engine, capable of developing 35-h.p., drives through chains on either side on to the front or driving wheels.

CONTINENTAL NOTES.

BY "AUTOMAN."

THE Mercedes radiator is well known to everyone who knows anything about automobiles, and has become the subject of controversy. It is, however, rapidly becoming a standard article of commerce, and no doubt in a short time no motor-car will be complete without a radiator made on the same principle or on similar lines. Everyone knows that the new products of the Cannstatt Daimler works are now by common consent christened after the Spanish christian name of M. Jellineck's daughter, Mercedes—Mercedes is the Spanish for Wednesday. The Mercedes radiator has, however, another name, and it is this other name which occupies my attention to-day. It is called the "*nid d'abeilles*." This has been erroneously translated into English as "bee-hive." I fear it is too late to stop the wrong translation from getting vulgarised. The French for "bee-hive" is "*ruche*," and the radiator resembles a "bee-hive" just about as much as it resembles a rabbit-hutch. "*Nid d'abeilles*," literally translated, means "bees' nest," and is only used in connection with wild bees—a wasps' nest is also called a "*nid de guêpes*." If one takes a nest of wild bees or wasps, the nest consists, of course, of waxen cells in which honey, pollen, or larvæ are lodged, and the radiator in question has somewhat

in Nice in the time allowed; the Gardner-Serpollet 'bus arrived at four o'clock with a bent front axle, caused by a "cannivau," and the Bardon wagon arrived late in the evening.

THE Nice week is now in full swing, and to-morrow the great event, the mile and kilometre race, will decide the fortunes of the competing makers. M. Leon Serpollet holds the record with 120 kilometres per hour (74½ miles). This, of course, only refers to the Nice record. The cars which are competing this year include Panhards, Mors, Mercedes, De Dietrich, Gobron-Brillies, and Gardner-Serpollets.

THE meeting opened on Sunday last with a battle of flowers, in which motor-cars suitably decorated were the great attraction. Neither the sun nor the numbers of cars which took part were as favourable as possible to success, but still some automobiles were most handsomely got up, and Mr. Warden had a Panhard car hidden in white flowers which was particularly handsome-looking; whilst a dog which accompanied him in the car was dressed as a *chauffeur*, goggles and all, and created a great deal of amusement.

THE 90-h.p. Mercedes will not be ready for the Nice meeting, but are being held back for the more important events of Paris-

The Serpollet 'Bus.

The Bardon Lorry.

THE CRITERIUM DES TRANSPORTS (AUTOMOBILES).

the appearance of such a nest cut in two. The correct English translation of "*nid d'abeilles*" in this connection is therefore "honeycomb," and instead of talking about "bee-hive radiators," which has no signification whatever, we should talk about "honeycomb radiators."

THE second annual Criterium des Transports Automobiles, commonly called the Paris-Nice caravan, started in the Bois de Vincennes on Saturday, March 21st, with a five hours' trial around the lake, with the following results:—

Name.	No. of laps.	Time occupied. h. m.	Petrol used kilos.
Peugeot	43	5 5	12.915
Bardon	43	5 4	5.460
Serpollet	62	4 58	61.680
De Dietrich	53	5 0	22.400
Ader	115	5 0	26.110

ON Sunday morning only three of the competitors turned up for the start to Nice, namely, Bardon, De Dietrich, and Serpollet. They valiantly set off on their interesting journey. Towards the end of the tour the weather became very bad indeed, and only the De Dietrich omnibus arrived on Friday, March 27th,

Madrid and the Gordon Bennett Cup, and it is rumoured that there will be some difficulty in getting them under the 1,000 kilo. limit. In the absence of the 90-h.p. the 60-h.p. Mercedes will have to do duty, and no less than eight of these new cars weighed in for the Nice week on Sunday morning. Their respective owners are Gray Dinsmore, Prince Lubecki, Higginbotham, Warden, Count Zborowski, Baron de Caters, Harmsworth and Terry. In addition to the Mercedes, only two Mors cars and one Rochet-Schneider weighed in on the first day in the 1,000 kilo. category. All the Panhards withdrew and forfeited stakes. It seems evident that this year's struggle at Nice will be confined to a duel between Mercedes and Mors, with the advantage of numbers largely in the favour of the former.

As the Gordon Bennett race is now only three months ahead of us, news of the competing cars is gradually leaking out. It is supposed that the Germans will have some difficulty in keeping under the 1,000 kilo. limit, and this sounds like having to use unexpected means of lightening the cars, which generally ends in cutting too fine and going too near the safety factor. Panhard, it is said, has got to the limit of his horse-power, and will use the same engine as last year or nearly so. Of the Mors

cars it is said the motor has worked up to 110-h.p. on the brake tests, so that at first sight it would seem that Mors was the most serious competitor. It is a most unfortunate thing that the dates of French races clash with those of the Irish week, for it will prevent a number of enthusiasts and good sportsmen from going over to Ireland. The hill climbs of Albertville, Laffrey and Mont Ventoux fall respectively on the 2nd, 5th, and 6th of July, but efforts are being made to put them off to a later date.

THE Spanish section of the Paris-Madrid course has been practically settled. M. Tampier has been over it with the Spanish authorities, and with some slight alterations the roads turn out, according to his account, to be remarkably good. There seems to have been a splendid effort made by the Spanish authorities, and stones have been laid on all the bad places. The steam roller is about to begin its work, and then, it is said, the road will be very good indeed. There are very few neutralisations in Spain, but, on the other hand, a good many level crossings and *cannivoux*. M. Tampier reports that the crossing of the Guadarrama range of mountains is not as difficult as La Turbie.

THERE has been a terrible story abroad about a car which was attacked on the Spanish roads by an angry crowd and stoned, and about a company of guards having been sent to catch the evil-doers and bring them in chains to Madrid for punishment. It turns out, however, that the story has been distorted and exaggerated, for the real truth is that an automobile party had the misfortune to steer into a milestone and break a front wheel. They were obliged to stop at a little village, and wait for it to be repaired. The inhabitants along the line of route are said, on the contrary, to be most enthusiastic about the race.

THE entries have reached the number 243, which has been secured by the Wolseley Tool and Motor Car Company, Limited; No. 241 falls to the Eagle Engineering and Motor Company.

A MOTOR garage has been opened in Peterborough by Mr. A. J. Robertson.

THE first motor-car auction sale on the Tyne has just taken place at Messrs. George and Jobling and Co.'s garage in South Street, Newcastle.

WITHIN the past few days The Motor Mart, Limited, have sold cars for Lady Sarah Wilson, Lord Willoughby de Eresby, and the Hon. E. G. S. Churchill.

THE Electric Ignition Company, of Birmingham, inform us that they have appointed Mr. E. J. Hardy, 39, Hendon Road, Sparkhill, as their sole agent in Coventry.

THE executive committee of the Cork International Exhibition have decided to offer a valuable cup for a mile or a three miles automobile race at Cork, after the Gordon Bennett race.

A SUGGESTION has been made that the London County Council should authorise the expenditure of £400 on two motor launches to be used on the lakes of Battersea and Victoria Parks.

MESSRS. S. W. STRINGER, LIMITED, of 43, Effingham Street, Rotherham, are keeping a stock of petrol, oils, etc. They have also facilities for carrying out repairs, and can send men out on motor-bicycles, on receipt of wire or telephone message, to repair breakdowns on the road.

THE Begbie Manufacturing Company, Limited, has been registered with a capital of £10,000 to adopt an agreement with Messrs. A. Firth and S. D. Begbie, and to manufacture, repair, and deal in apparatus, engines, etc., used by motor manufacturers, etc. The registered office is at Cumberland Park, Willesden Junction.

THE SPARKING PLUG "DISCOVERY."

THE sparking plug "discovery" continues to attract considerable attention in motoring circles, and new devices providing for the external gap in the high tension circuit are making their appearance almost daily. This week we give illustrations of another batch. One of the simplest and most compact is than of Messrs. Salsbury and Sons, Ltd., illustrated in Fig. 1. As will be seen, in this the gap is provided within the

Fig. 1.

plug itself, the lateral hole being formed in the porcelain, and the central rod made in two pieces. To avoid all danger from explosion of accumulated vapour, the spark gap may be enclosed with a mica window, or thin copper gauze. Fig. 2 shows another neat contrivance which Messrs. Brown Bros., Limited, have just put on the market. The Brown Spark Intensifier is intended

Fig. 2.

to be fixed to the end of the high-tension wire, the loop end, being provided for attachment to sparking plugs of all kinds. The points are enclosed in a glass tube which is hermetically closed, thus obviating all danger of a naked spark igniting any escaped petrol gases. Another advantage of the "Brown" device is that the points can be adjusted to any distance. Fig. 3

Fig. 3.

Fig. 4.

illustrates the "Phlarix" glass-covered intensifier of Messrs. H. and A. Herbert. Like the "Brown" this is intended to be fixed at one end to the high-tension wire and by the other to the plug, the gap also being adjustable. Messrs. G. T. Riches and Company are marketing the arrangement shown in Fig. 4, while Mr. Chas. H. Rush, of Gray's Inn Road, W.C., has sent us a sample of one he has just introduced. We are unable at present to give an illustration of this, but may say that it is of the naked gap spark variety; it is, however, exceedingly simple and compact.

THE makers of the Tony Hubert cars are reported to be about to bring out an electrical change-speed gear for petrol cars.

THE *Making Mail* of the 23rd February records with pleasure the arrival of a 16-h.p. motor omnibus built by the Motor Manufacturing Company, Ltd., for the Consolidated Investment Company of Johannesburg.

MOTOR-CYCLING NEWS.

DURING the last German military manœuvres some trials were made by Herr Hauptmann Reinecke, head of the cyclists' corps of the 2nd Lower Silesian 2nd Infantry Regiment with a motor-bicycle made by the Neckarsulmer Fahrradfabrik. The officer in question, who is shown at side of his motor-cycle in the accompanying illustration, has just issued a report on the result

of the experiment in which he expresses the opinion that the use of the motor-bicycle in military operations is not only practicable but advantageous, and that every military cycle corps should be provided with at least two motor-cycles for dispatch carrying and relay purposes.

THE programme of the sports meeting to be held on the Preston Park track, Brighton, on Easter Monday includes a three mile motor-cycle handicap.

ON Saturday last a hill climbing competition was held in connection with the Ulster Centre of the Motor Cycle Union of Ireland. The course was a public side road in Glenmachan. There were two sharp turns in the road, the gradient was not sufficiently steep the entire way, and the surface was a trifle uneven. To add to these drawbacks, the weather was most unfavourable, rain and hail rendering the road sloppy and slippery. The distance to be covered was 600 yards, and telephonic communication was established between the starters and timekeepers, thus getting over the difficulty caused by the crookedness of the road. The handicap was framed according to the power of the engine and the weight of the rider. Competitors pedalling after the line was crossed were disqualified, and one attempt only was allowed. Thirty entries were received but only fifteen started. Four prizes were offered and awarded as follows.

	Nett Time.	Handicap Time.
	Seconds.	Seconds.
1.—T. Mallon (2-h.p. Quadrant) ...	56	28½
2.—L. Porter (2½ h.p. Werner) ...	46½	34½
3.—R. G. Wilkinson (2 h.p. F.N.)...	48	37
4.—R. W. Ireton (2½ h.p. Riley) ..	46½	37½

A FIVE-MILE motor-cycle handicap is included in the programme of the sports meeting which the Bury St. Edmunds Bicycle and Athletic Club will hold on Easter Monday.

A ST. LOUIS motor cyclist, Mr. F. Weber Benton, proposes to make a tour this summer from California to St. Louis on a motor-cycle. He will be accompanied by an assistant, who will take

photographs to illustrate a proposed series of articles on the trip. They expect to penetrate spots hitherto inaccessible, except on foot, thereby demonstrating the practicability of the motor-cycle for such travelling, and at the same time securing much material that will make interesting reading. The travellers will descend into old Mexico, cross the scenic belt of Arizona, touching the territory of the cliff dwellers and passing through the depths of the Grand Canon of the Colorado. The start will be made from California early this month, and the distance of 3,500 miles is expected to be covered in about three months.

A MOTOR-CYCLING tournament has been arranged to be held at the Memorial Grounds, Canning Town, on Saturday next. The programme includes an open handicap and a series of races between Chase and Martin. Five events will be contested—viz., one mile with flying and standing starts, and five miles flying and standing starts, in all of which Chase will ride a 2½-h.p. Bat, and Martin a 2½-h.p. Excelsior. The fifth event will be one mile, Chase riding a 4½-h.p. Soncin, and Martin a 2½-h.p. Excelsior, Martin receiving half a lap start.

TWENTY motor-cyclists are required by Captain W. P. Wethered, Cyclist Officer of the Home Counties Volunteer Brigade, for the cyclist manœuvres on the 10th and 13th inst. The riders must already be members of a volunteer corps, and should obtain consent from their commanding officer to take part as a member of the Composite Motor Cyclists' Company or Section, under Captain Wethered. Gentlemen who are willing to take part in these manœuvres are requested to send in their names, with rank and corps, to Mr. F. Straight, at the Automobile Club, by Monday next.

IN the programme of the sports meeting of the Irish Cyclists' Association, to be held at Ball's Bridge, Dublin, on Easter Monday, we notice a five mile motor-bicycle pursuit race.

The Grmonde Motor Bicycle and Trailer.

THE New York Motor Cycle Club has appointed a committee to obtain an expression of opinion from other motor-cycle clubs and unattached riders as to the desirability of effecting an American national organisation. The idea is to hold a meeting of motor-cyclists at some central point during the early summer, with the view of bringing the organisation into existence.

AT the last run of the Wolverhampton A.C. it was noticed that of seventeen vehicles taking part, six were of local manufacture.

HERE AND THERE.

A MOTOR-CAR club is being suggested for Stourbridge.

THE Halifax Club will have a run to Southport on Easter Monday.

THE Marquis and Marchioness of Tullibardine have been paying a round of visits in Glasgow by motor-car.

A FEATURE of the Aintree racecourse last week was the large number of motor-cars. Everywhere automobilism is in the ascendant.

THE Automobile Exhibition at the Agricultural Hall, according to the *World*, still further strengthened the position of the motor industry.

THE opening run of the Brighton Motor Club will take place on Good Friday, starting at 11.15 from the headquarters, 12, Marlborough Place. The destination is Arundel, and all motorists are cordially invited to join in the run.

AN auction sale of motor-cars is announced at Cheltenham

MESSRS. HOBSON, RICHARDS AND COMPANY will hold a sale of electric motor-cars at Manor Street, King's Road, Chelsea, S.W., on Tuesday next.

THE Velox Motor Company, Limited, and the Humber Company, Limited, are both at work on new types of popular-priced petrol cars.

A MOTOR repairing shop has been opened at 219, South Street, Perth, by Mr. Jas. M'Farlane. A stock of petrol, oil and motor accessories will be kept.

AT the Society of Engineers, on Monday next, a paper will be read entitled "Road Maintenance and Administration," by Mr. Robert J. Thomas, M.Inst. C.E.

A MOTOR-CAR is to be presented to Dr. Jacob, the new Bishop of St. Albans, by his friends in the diocese of Newcastle, which he is leaving. Both the Duke of Northumberland and Earl Grey approve of the idea.

One of the new 60-h.p. Mercedes Cars which will take part in the Paris-Madrid Race. *(La France Automobile)*

THE first 18-h.p. 1903 Mercedes car in this country, which was exhibited on Mr. J. E. Hutton's stand during the last two days of the Agricultural Hall Show, was sold on Saturday last to Mr. H. W. Spiller, of London.

THE Huile "Vitesse" Company, Limited, has been registered with a capital of £32,000 to carry on the business of dealers in oils for the lubrication of cylinders of automobiles, motor cycles and general machinery.

MR. GEORGE R. HELMORE, secretary of the Automobile Mutual Protection Association, tendered his resignation at the annual general meeting recently held, and it was accepted with regret. Mr. Helmore will remain in office pending the appointment of his successor.

MESSRS. A. DARRACQ AND COMPANY, LIMITED, have been registered with a capital of £375,000 to acquire the business of A. Darracq et Cie., carrying on trade at Suresnes, France, and elsewhere; to enter into a deed of contribution between A. Darracq et Cie. and this company for the transfer to this company of the said business in consideration of an allotment of 100,000 preference and 217,214 fully-paid ordinary shares, whereof the Anglo-French Motor Syndicate, Limited, is to receive 57,109 shares in respect of services rendered.

AT the inaugural meeting of the Norfolk Club at Yarmouth, on Saturday the 11th inst., the cars will be stored at the Victoria Mews, while luncheon is in progress at the Royal Assembly Rooms. All motorists touring in the neighbourhood are invited to the latter function, which will take place at 1.30 p.m.

AMONG those who placed motor-cars at the disposal of the candidates in the recent Chertsey election were Mr. A. J. Balfour, Mrs. Leopold de Rothschild, Lord Churchill, Mr. Griffith Boscawen, M.P. (who drove himself), the Hon. R. Guinness, Captain Pearce, Dr. Bruce, Mr. C. D. Rose, M.P., Sir C. McLaren, M.P., Sir George Newnes, M.P., Mr. A. E. Derry and Mr. J. Allen Baker, L.C.C.

MOTORISTS are reminded that the entries for the Glasgow to London Non-stop Trial, 13th and 14th May, particulars of which have already appeared in our columns, close on April 13th. Copies of the conditions and entry forms may be had from the secretary of the Scottish Club (Western Section) who are organizing the trial, Mr. R. J. Smith, 59, St. Vincent Street, Glasgow. Although the trial is called non-stop, a night is to be spent in Leeds *en route*, but no time is allowed there for replenishing, etc., the cars remaining under absolute custody of the Club from arrival to departure.

THE Isle of Thanet highways were in perfect condition for motoring last week-end, and policemen were cautious and sensible.

A MEETING of motor traders in Scotland is to be held in Edinburgh on April 14th, to consider the question of forming a Scottish Motor Traders' Association.

THE Italian kilometre record now stands at 30 seconds, this having been accomplished on the road between Fiumicino and Rome last week by Baron Franchetti.

A CONFERENCE of the Clubs affiliated to the A.C.G.B.I. has been held, at which the Liverpool Self-propelled Traffic Association, the Scottish, Manchester, and Yorkshire Clubs expressed opposition to affiliation to the Motor Union.

MESSRS. C. S. ROLLS AND CO. have sent us a copy of a descriptive pamphlet they have issued dealing with the Krebs automatic carburettor. They are keeping a 7-h.p. two-cylinder Panhard car fitted with the carburettor ready for trial by intending purchasers.

THE United States Long Distance Automobile Company is building a 40-h.p. four-cylinder petrol car to the order of the U.S. Ordnance Department. The body will be practically a machine shop, fully equipped with all the necessary tools and spare parts, to follow the artillery branch of the service.

An "Argyll" Car in the Highlands.

MR. H. CHARNOCK has opened a garage and repair shop in connection with the Bull's Head Hotel, Hazel Grove, Cheshire, of which his father is proprietor. This establishment is on the main road from Manchester to Buxton, Macclesfield, etc., and Mr. Charnock is well able to render assistance to motorists passing that way.

A USEFUL item of news comes to hand from Mr. G. M. Harris, resident engineer of Alexander's Electric Works, Carlisle. It is to the effect that these works are always available for charging accumulators, both small ignition batteries and the larger batteries for electrically-driven cars. The works are on the route of the Cup race. The leading Irish hotels are also arranging for the storage of cars, and the Midland Great Western Railway of Ireland is prepared to accommodate motor-cars at its hotels at Mallaranny, Co. Mayo and at Connemara.

THE Automobile Club of America has definitely decided to hold a trial of commercial motor-vehicles. The dates chosen for the contest are May 20th and 21st. The course each day will be 20 miles, and will be gone over twice, making 40 miles in all per day. All classes of vehicles will take part in the test; the electric, petrol and steam classes will be each subdivided into four classes, based on the load to be carried, which will be respectively 750 pounds, 2,000 pounds, 3,500 pounds and 10,000 pounds.

MR. LAMB, the Secretary of the Stanley Automobile Exhibition, informs us that in consequence of the unsuitability of the Earl's Court Exhibition Buildings, the Stanley Club have decided not to organise an automobile exhibition there in 1904.

LIEUTENANT MARK MAYHEW, of the Middlesex Imperial Yeomanry, is to be appointed to the command of the new Motor Volunteer Corps, with the rank of Lieutenant-Colonel. Captain Skeffington-Smyth, 9th Lancers, has been nominated as Adjutant.

THE Pope-Robinson Company, of Hyde Park, Mass., U.S.A. have sent us a copy of their catalogue, in which the Robinson touring car is fully described. The vehicle, which is on Panhard lines, is fitted with a four-cylinder engine, the cylinders being 4in. dia. by 6in. stroke.

MR. N. CHEREAU, who is now managing the London business in Bleriot lamps, is also acting as London manager, at 54, Long Acre, W.C., for the Societe Anonyme des Etablissements Falconnet-Perodeaud, whose specialities include an armoured anti-slipping protector for pneumatic tyres.

CLIMBING a mountain through snow to the hubs was the severe test recently given a 10-h.p. Martini car by a Swiss automobilist, Captain Nabholz von Grabow. The ascent was made up the Uetli mountain, 2,863 ft. above the sea level. The latter half of the ascent was a rough road through wood and fields, used only for wood transport, which was covered with deep, soft snow.

THE Automobile Internationale, Limited, has been registered with a capital of £50,000 to acquire the business of La Societe Anonyme Dechamps, Bruxelles, and all or any of its assets and liabilities, to adopt an agreement with Mr. L. Swan, and to carry on the business of manufacturers of motor-car, cycles and vehicles of all kinds.

MR. FRANK ZIRBES, of Racine, Wis., is coming over to England in the interests of the Mitchell motor-bicycle, and will compete in motor-cycle races wherever eligible this season. It will be remembered that last year Mr. G. Vernon Rogers came over and competed in several events, but his promotion to the sales management of the Wisconsin Wheel Works will keep him at home this season.

THE Lancashire Wagon Company, Limited, has been registered with a capital of £250,000 in £10 shares, to adopt an agreement for the acquisition of the business of a company of the same name (incorporated in 1857), and to carry on in the United Kingdom or elsewhere the business of making, building, or manufacturing railway carriages, motors, motor-cars, etc. The registered office is at 22, Broad Street, Bury.

AT Dublin, on Saturday, the Marquis of Downshire was charged with having negligently managed his motor-car on the previous evening, with the result that Elizabeth Magee, a widow, aged sixty-five, was knocked down and seriously injured. The evidence showed that the car was travelling at the rate of six miles an hour, that the defendant sounded the horn several times to warn the woman, and that everything was done to prevent the accident. The Marquis afterwards conveyed Mrs. Magee to a hospital in the car. The case was adjourned, the defendant promising to appear again to-day (Saturday).

THE Ordnance Survey is about to commence the publication of a new pocket map on the scale of two miles to one inch of certain areas of England and Wales, and an advanced proof of the Bath sheet has reached us. This map has the hills shaded, woods coloured green, roads sienna, water blue, and contours brown; the bolder slopes are brought out by stipple shading in brown, and many altitudes are given along roads and at other principal points. The map is mounted on linen, folded outwards so as to admit of its being read without necessarily opening the whole map, a method specially adapted for motorists. It shows very distinctly all the chief features, including towns, villages, roads, railways and stations, rivers, canals, hills, and county boundaries. It was in the first instance prepared for War Office purposes, but will be on sale to the public.

The Motor-Car Exhibition at the Agricultural Hall.

(SECOND NOTICE.)

Photo by]

General View of the Large Hall.

[Argent Archer.

"GRUMBLE though they may at the number of exhibitions which they are expected to support, the manufacturers of motor-cars do not manifest any disposition to neglect them. The fact remains that the third show of the year in London, which opened at the Agricultural Hall on Saturday last, and closes this evening," said the *Field* of the 28th ult., "is the largest of the series, and has the disadvantage to the visitor that it is rather too extensive for convenient inspection." Below we continue our report of the leading exhibits, the conclusion of which will be given in future issues.

PETROL CARS.

While perhaps comprising no new feature, the 16-h.p. "Automotrice" chassis shown by the SOCIÉTÉ FRANÇAISE D'AUTOMOBILES gave every evidence of good workmanship. In the fore-part of a wood and steel frame is set a four-cylinder engine, having mechanical inlet valves located on the opposite side to the exhaust valves. The governor, in conjunction with which is an accelerator, is adapted to act on the inlet. Four speeds forward and a reverse are provided, the power on the top speed being transmitted direct through a longitudinal shaft and bevel gearing to the rear live axle. The Société Française also exhibited a 9-h.p. tonneau car with De Dion engine, a 21-ft. motor launch, with 4-h.p. "Abeille" petrol engine, a Herald 24-h.p. four-cylinder motor, a "Zebus" 2½-h.p. motor bicycle, and samples of the Dalifol 1½-h.p. and 2½-h.p. bicycle motors, and "Gallia" ignition accumulators.

The LONDON MOTOR GARAGE COMPANY, Limited, had two large stands, on which were staged an interesting collection of 10-h.p. Lanchester, 20-h.p. Mercedes, 15-h.p. "Pipe," and 12-h.p. two-cylinder, and 16-h.p. four-cylinder "Magnet" cars. As these have all been dealt with previously in the *Journal*, it need only be mentioned that the 20-h.p. "Magnet" was fitted with a special tonneau body seating six persons. The novelty on the stand was the chassis of the new 15-h.p. four-cylinder "Pipe" car. The engine has mechanically-operated inlet valves, interchangeable with the exhaust valves. All the valves are on one side, and operated by the same cam shaft. The carburettor is fitted with a jacket through which part of the cylinder cooling water can be made to pass. In other respects the chassis follows the lines adopted in the standard type of "Pipe" car.

The novelty on the stand of Messrs. HEWETSONS, Limited, was, of course, the new "Benz Parsifal" cars with vertical engines. The new car is of 10-h.p. The motor comprises two cylinders, and, to permit of easy access to the valve chambers, the covers are held on their seatings by box-nuts, which have simply to be loosened to allow inspection. A low-tension system of ignition is adopted, the current being generated by a gear-driven magneto. The latest type of radiator and a spray

carburettor are used. An improved form of lubricator is fixed on the dash, for general lubrication, and a hand force-pump is used to feed oil to the crank-chamber and gear-box. The change speed is actuated by a single lever, which provides a direct drive on top speed, three speeds and a reverse being available. A metal-to-metal brake, operating on a steel drum, is placed immediately behind the gear-box, and the usual side brakes are fitted. Vehicles of the two-cylinder type are constructed in three sizes, 8, 10, and 12-h.p., and the general workmanship is of that class which has made the Benz vehicles so popular. The well-known Benz cars with horizontal engines were represented by a 6-h.p. Doctor's car, and a tonneau, a 7-h.p. car with double-cylinder tandem engine at the rear, a 7-h.p. lorry, to carry loads up to 25 cwt., and a 10-h.p. tonneau with bus top. The latter has a double-cylinder engine with three speeds and reverse, the power being transmitted by a single wide belt to the change-gear shaft and thence by chains to the rear road wheels. We hope to illustrate the latter vehicle in an early issue.

The BURLINGTON CARRIAGE COMPANY, Limited, displayed three of the latest De Dietrich (Turcat-Mery) cars—a 16-h.p. four-cylinder tonneau, a 24-h.p. four-cylinder Limousine, and a 10-h.p. two-cylinder tonneau, and a chassis. Although combining many of the best points of the latest Panhard and Mercedes practice, the new car exhibits much originality in detail. Broadly it follows the standard arrangement of vertical motor in the fore part of the frame, friction clutch, change-speed gear, and two side chains. The motor comprises two or four cylinders. The governor runs in an oil bath case, and magneto ignition is employed. The carburettor is fitted with a regulator or throttle, by means of which, and the firing control, the motor is claimed to be as flexible as a steam engine. The various details have been carefully thought out, this being especially noticeable as regards the friction clutch, which can be adjusted with very little trouble.

The leading feature of attraction on the stand of Messrs. C. S. ROLLS and Co. was undoubtedly the 80-h.p. Mors racer on which the Hon. C. S. Rolls recently established a record kilometre run at Welbeck. The vehicle has already been illustrated in the *Journal*, as has also the 10-h.p. Panhard car, with removable brougham top. Well-finished specimens of the 7-h.p., 10-h.p., 15-h.p., and 24-h.p. Panhards were also staged, the latter being fitted with a Muhlbacher tonneau body, with a removable hood extending over front and back seats. The details of the Panhard cars are now too well-known to need description, while as to the body work of the vehicles exhibited it is almost needless to say that this is of the highest class.

The DU BOIS Co., Ltd., had hoped to have on view a new 11-h.p. two-cylinder petrol car and a 10-h.p. steam car with tonneau body, the boiler being located under a bonnet, but, unfortunately, the vehicles did not arrive from America in time.

A new exhibitor in the South was THE MO-CAR SYNDICATE, Limited, whose Arrol-Johnston cars attracted considerable attention, probably by reason of the marked difference between them and the type to which we have become accustomed. The cars shown comprised a couple of four-seated dogcarts, a six-seated car with canopy (Fig. 26) and a chassis. The makers explain that their object has been not to produce a light semi-racer, but a car, while capable of high average speeds, which shall be comfortable, reliable, durable, and easy of manipulation. The 12-h.p. car can keep up an average speed of eighteen miles an hour over such roads as prevail in the South of Scotland, can climb any ordinary gradient fully loaded, and

Fig. 26. —The Arrol-Johnston 12-h.p. six-seated Car

if desired, can run up to over thirty miles an hour on the level. The engine, which is mounted high up on the frame, under the rear seats, is of the balanced type, and comprises two cylinders and four pistons, the pistons receding from each other and the combustion chamber being directly in the centre of the cylinders. It develops 12-h.p. at a normal speed of 700 revolutions per minute. The connecting rods work on two rocking levers, placed at each end of the cylinders, and from the other end of these the power is transmitted to the crank shafts below. A rotary magneto-electric machine driven by chain off the crank shaft is provided for igniting the mixture, which is supplied by a special float-feed carburettor. The exhaust valves are lifted by cams on a pair of two to one shafts and through the medium of a hit-and-miss governor of the pendulum type. On one of the control levers is fitted a screw handle which regulates the tension of the governor spring, thus acting as an accelerator or retarder, and allowing the speed of the engine to be controlled by the driver. Four forward speeds and a reverse motion are provided by a sliding train of wheels. From the engine the power is conveyed by a Renold silent chain through a clutch to the change-speed shaft, and from the lay shaft by a second silent chain to a short intermediary shaft at the rear of the live axle, to which it is connected by spur gearing. A double system of lubrication is provided, one by means of gravity and the other by means of a force pump driven from the engine, which forces the lubricant up through the rocking lever and connecting rod bearings. The back axle, which is of very ample proportions, is fitted with roller bearings. The car is fitted with two

Fig. 27.—The Horbick 10-h.p. Car.

independent brakes, one acting on the change gear shaft by means of a foot-lever, the other on the rims of the wheels, to be used as an emergency brake, through a hand-lever. It is claimed that the strength of the cars, together with the manner in which the bodies are hung on the springs, renders it possible to use solid tyres with the greatest comfort. The water circulation for the cooling of the engine is maintained by a chain-driven pump and Clarkson radiator. We may add that one of the cars on the stand was driven down by road from Paisley, the journey of 443 miles

being taken in easy stages, and covered in two and a-half days. A novel method of starting the engine from the seat is provided, this consisting of a rope passing over a flanged pulley, on pulling which the compression is immediately released, and by further pulling round the pulley a gear is put into engagement with a pinion on the engine crank shaft.

A new firm at the London Show, of which more is likely to be heard in the near future, was Messrs. HORSFALL AND BICKHAM, whose cars include a number of interesting features, and bear evidence of careful construction and design. The exhibit comprised an 8-h.p. chassis (Fig. 28), and two complete 10-h.p. cars (Fig. 27); as the general arrangement is the same, the following description may be taken as applying to both vehicles. The main frame is of tubular construction, an underframe of planed channel steel being provided to support the motor and gear box. In the fore-part of this is carried a two-cylinder motor, the dimensions of the 8-h.p. being 3 9/16 in. cylinder diameter by 4 in. stroke, the normal speed being 900 revolutions per minute. The 10-h.p. engine has cylinders 4 1/8 bore by 4 3/8 in. stroke, 800 revolutions being the normal speed. The two cylinders, together with their heads, are cast in one piece. An automatic governor acting upon the throttle valve is fitted, while the normal speed of the engine can be varied by a lever on the steering pillar through a Bowden wire. A similar lever on the other side of the pillar times the ignition. The levers project from small friction discs fitting against flat faces, and pressed up against them by an adjustable nut. The wires leading to the ignition plugs are connected to spark gaps enclosed in a glass-fronted case on the dash, the current sparking across them on its way to the cylinders. In the same case is mounted a watch, the light given by the jumping spark being sufficient to illuminate the watch dial at night. Three forward speeds and a reverse are provided, the power being transmitted direct on the top speed by a cardan shaft and bevel gearing to the rear live axle. In the 10-h.p. cars a spring cushion is introduced in the small part of the clutch, which is of the expanding type. The change-speed gear is of the sliding type, the side shaft being noticeable in that it, together with its spur wheels, is machined out of a solid bar. The bearings of the gear-box are double, and are "ring" lubricated, light chains, however, being substituted for the ordinary rings. A telescopic coupling is introduced on the universally-jointed shaft, con-

Fig. 28.—Plan View of Chassis of Horbick 8-h.p. Car.

veying the power from the gear-box to the rear axle. The foot-operated band brake behind the gear-box is of the metal-to-metal type, and the hand-actuated brakes on the hubs of the rear wheels are of the expanding form, the latter being an improvement since the photograph reproduced in Fig. 28 was taken.

The new PRITCHETTS AND GOLD petrol car in general arrangement follows the lines of the Panhard type of automobile. The frame is of pressed steel. The power is supplied by a Blake 14-h.p. four-cylinder vertical motor, fitted with water circulating pump and radiator. The normal speed is 900 revolutions per minute; by means of the throttle and accelerator the speed can be varied between 250 and 1,500. Electrical ignition is adopted. The transmission is on Panhard lines, three speeds forward and a reverse being provided. From the differential shaft the power is conveyed to the rear road wheels by side chains. A comfortable tonneau body is fitted, while there are the usual brakes. The brakes on the rear wheels, which are compensating, are controlled by a hand lever, which also throws out the clutch, and in addition applies the countershaft brake at the same time. The various details appear to have been well thought out, resulting in a vehicle of substantial and attractive design.

• A public service vehicle of the type now in use between the Marble Arch and Cricklewood was shown on the stand of STIRLING'S MOTOR CARRIAGES, LIMITED. An illustration of this has already been given in the *Journal*, so that we need only mention that it is fitted with a vertical two-cylinder motor developing 12-h.p., and that seating accommodation for twelve passengers is provided. On the same stand Messrs. Stirling had on view a 2 1/2-h.p. petrol motor, with propeller and reversing gear, for a small launch.

MESSRS. A. DOUGILL AND CO., LIMITED, had hoped to have shown one of the Hagen petrol lorries capable of carrying a load of three tons, and of hauling a trailer; but, unfortunately, were not able to take advantage of their space. The vehicle is fitted with a 7-h.p. single-cylinder engine running at the slow speed of 450 revolutions per minute. The transmission

is on novel lines, and cannot be well described without drawings, which we hope to publish in a subsequent issue.

— Quite a new car to the English market is the "Spyker," shown on the stand of the BRADFORD MOTOR CAR COMPANY. They are made by the Trompenburg Manufacturing Company, of Trompenburg, Holland,

Although represented only by a single car, the PHOENIX MOTOR COMPANY had an exhibition which was worthy of much attention. This consisted of a Phoenix 12-h.p. tonneau car (Fig. 30) the frame of which is constructed of one piece of channel steel. The engine is of the double-cylinder vertical type, the cylinder being $4\frac{1}{2}$ in. diameter by $4\frac{1}{2}$ in. stroke, and the

Fig. 29.—The "Spyker" Car.

the whole output for the next three years having been secured by Mr. House, of the Bradford Company. They are made in two sizes—12-h.p. double-cylinder and 20 to 24-h.p. four-cylinder. The car staged was a handsomely-finished 20 to 24-h.p. tonneau (Fig. 29) and judging from the large number of motorists to whom vehicles have already been sold it is likely to become a familiar type in the North of England during the coming season. The design of the car is on up-to-date lines, the engine having mechanically-

normal speed 800 revolutions per minute. The water circulation is maintained by pump and a combined honeycomb cooler and tank. The governor is adapted to act on the gas admission, an auxiliary valve being provided by means of which cold air is drawn in the engine when the latter is throttled down. A hand lever, acting on the throttle valve, is also provided. Three speeds forward and a reverse motion are provided, the drive on the top speed being direct. From the gear-box the power is

Fig. 30.—The "Phoenix" 12-h.p. Car.

operated inlet valves. Pressure on our space this week prevents us from referring to the various features of interest, but we hope to deal with the car in detail in an early issue. On the same stand were staged a 10-h.p. Panhard car with Lamplough Roi-des-Belges tonneau body, and a 9½-h.p. Clement car, with mechanically-operated inlet valves.

conveyed through an universally jointed shaft and bevel gearing to the rear live axle, which is entirely enclosed, and runs on roller bearings. A special flexible coupling is mounted between the clutch and the gear-box. The brakes on the hubs of the rear wheels are, contrary to the usual practice, operated by a pedal, the depression of which also disengages the clutch,

the hand-lever at the side controlling a brake on the cardan shaft. The car, which appears to be well finished, weighs complete about 15 cwt.

Foremost among the exhibits of the GENERAL MOTOR CAR COMPANY, Limited, was a 30-h.p. tonneau car fitted with a Buchet four-cylinder motor, four speeds and reverse, and chain drive. On this stand was also to be seen a neat little tradesman's delivery motor-car, with 4½-h.p. motor, belt and chain drive; this is designed to carry a load of over 200 lbs. and two people at a speed of twelve miles an hour. Another van, intended to carry from 6 to 7 cwt., was fitted with a 6-h.p. Aster engine. It has two speeds, the transmission being by belts to the countershaft, and thence by a single centrally-located chain. The General Company appear to be devoting considerable attention to the construction of light motor delivery vans.

A new type petrol car was to be seen in the "Kensington," jointly shown by Messrs. RAWLINGS BROTHERS and Messrs. OFFORD and SONS. They are made in two sizes, 9-h.p. two-cylinder, and 15-h.p. four-cylinder, an example of each being staged. The vehicles throughout are on Panhard lines—vertical motor in front, speed-box with four speeds and a reverse on one lever, differential countershaft, and side chains. The 9-h.p. engine has two cylinders, and the 15-h.p. four cylinders; the normal speed being 950 revolutions per minute. The governor is adapted to act on the inlet, while we noticed that the cam shaft is driven off the crank shaft by helical gear wheels. Special couplings are provided between the clutch and the gear box, and between the latter and the differential shaft, allowing the frame

latest productions is a powerful vehicle fitted with a 15-h.p. four-cylinder engine, mechanical inlet valves, governing on the inlet. The gear is of the Panhard type, giving four speeds forward and one reverse, all actuated by one lever. The car which the Star Company have built for the Eliminating Contest of the Gordon Bennett Cup Race put in an appearance on Thursday last week, and naturally came in for a large amount of attention. An illustration and brief description of it are given elsewhere in the present issue.

The exhibit of the BRITISH PEERLESS MOTOR COMPANY comprised a "British Peerless" chassis and a complete tonneau car. These, as the name implies, are of English construction. The frame is of tubular construction, in the fore part of which is set an 8-h.p. single cylinder vertical motor. The cylinder is 4½-in. diameter by 4½ in. stroke, the speed being from 1,200 to 1,300 revolutions per minute. A feature of the engine is that the crank case and girder supports, the latter being equal to the full width of the frame, are made in one piece. The pump is so made that it can quickly be detached, while a throttle valve is provided. Three speeds and a reverse are provided by the usual type of sliding gears, controlled by one lever. From the gear box the power is transmitted by universally-jointed shaft and bevel gearing; a flexible joint is also provided between the clutch and gear box. The steering is by wheel, worm, and segment. A foot brake is provided, and in addition an emergency brake is fitted at either end of the back axle, controlled through equalising gear, from a

Fig. 31.—The Kensington 9-h.p. Car.

to rock without in any way disturbing the drive. Ring lubrication is adopted on all the main bearings. A central oiler is provided from which tubes branch to the different bearings. Each branch can be regulated independently, although all can be cut off, controlled, or opened simultaneously by a single lever. When the motor is stopped, no oil flows, but when it is started, the exhaust gases press on the surface of the oil, and the feed starts. The brakes are entirely metallic, and before acting disengage the clutch. The double-acting brake on the differential shaft is operated by a pedal; the wearing part has a cast-iron lining, which can be easily renewed. The brakes on the rear wheels are operated by a hand lever, and are of the internally expanding type.

Four or five cars were to be seen at the stand of the STAR ENGINEERING COMPANY, one being a facsimile of the vehicle supplied to the Automobile Club—a 7-h.p. twin-cylinder car, with tonneau body. The motor is governed on the inlet, and is water-cooled by means of pump and radiators. The gear is on Panhard lines, giving three speeds forward and one reverse, all actuated by one lever, and the power is transmitted from the countershaft to the road wheels by two side chains. Two independent double-acting brakes are fitted, one on the countershaft and the other on brake drums on the rear road wheels. The wheel base is very long and the wheels are 32 in. equal, fitted with 3½ in. pneumatic tyres. Another noteworthy vehicle was a 10-h.p. car. This is similar in design to the 7-h.p., but has a four-cylinder motor and four forward speeds. One of the Star Co.'s

lever at the driver's right hand. When either brake is applied the clutch is automatically thrown out.

Two cars formed the exhibit of the CANTERBURY MOTOR COMPANY. The first of these was a neat little four-seated vehicle. This follows standard lines, being fitted with a 6-h.p. De Dion engine in front, and having three speeds forward and one reverse; the power is transmitted by bevel gear to the rear live axle. Both hand and foot brakes are provided, both, on application, first disengaging the clutch. The brakes on the rear wheels are of the internal expanding type. The larger car, while following the generally accepted lines, contains a few special features. The frame is built of wood and steel; the motor is a 12-h.p. double-cylinder Aster with water circulation maintained by pump and honeycomb radiator. The water-circulating pipes are of flexible tubing. Three speeds forward and one reverse are controlled by one lever. From the gear-box the power is conveyed to the differential shaft by bevel gearing, and thence to the rear road wheels by side chains. The clutch is of the internal cone type, and between it and the gear-box is a special coupling to enable the clutch to be taken out easily when necessary. The differential gear on the countershaft lies outside the gear-box, and the sprockets on the end of the countershaft are so constructed that they can be changed without removing the hubs of the wheels. In contradistinction to the usual method, we noticed that the brakes on the hubs of the rear wheels are operated by a pedal, and the countershaft brake by a hand-lever.

The "Weller" car, which only made its appearance about a couple of months ago, has come into prominence with a bound, the stand of Messrs. WELLER BROTHERS, Limited, at the Show last week, being continuously surrounded by a crowd of interested spectators. Their exhibit comprised a 20-h.p. four-cylinder touring car (Fig. 32), and a 10-h.p. two-cylinder chassis, the arrangement in both being practically identical. As we gave a lengthy description of the car in our issue of the 14th February last, it is only necessary to briefly mention the more salient points. In the

rear wheels through a clutch, gear box, differential countershaft, and two side chains. Four speeds forward and a reverse are available. The four speeds are actuated by a cam-gearing controlled by a lever on the steering column. The reverse is actuated by a pedal, and enables the car to be reversed on any speed without changing gear. The depression of the pedal first puts on the brakes and then reverses the motion of direction. Contrary to usual practice, the rear wheel brakes are operated by the pedal, and the differential brake by a side lever. The car has a long wheel base,

Fig. 32.—The "Weller" 20-h.p. Car.

first place, the motor, cooling apparatus, gear box, differential shaft and exhaust box, are all supported on an under-frame of stamped steel suspended from the main frame of similar construction by three connections, one at each end of the differential shaft and one at the fore-end of the under-frame, the latter connection being made with a swivel joint, so that no give or flexibility in the main car frame is communicated to the under frame, thus enabling the roughest roads to be traversed without danger of throwing any bearing in the running gear out of alignment. These three connections are secured by means of castellated nuts, by undoing which the driving mechanism (Fig. 33) may be entirely dropped out of the car, if necessary. The four-cylinder motor is novel, in that each is complete in itself except that the crank shaft is in one piece; the four cylinders with their crank cases being connected together by long external bolts. The cylinders are 4 in. bore by 5 in. stroke, the normal speed being 1,000 revolutions per minute. Mechanically-operated inlet valves with variable lift and period

and with its aluminium body weighs about 24 cwt. As mentioned last week, Messrs. Weller have been commissioned by Mr. E. Owers to build an 80-h.p. racing car, to be ready for the 1904 season.

The VICTORIA CARRIAGE WORKS, Limited, who have been appointed London agents for the Humber petrol cars, exhibited a 12-h.p. tonneau and a 20-h.p. chassis of this type. As the mechanical details have recently been dealt with at length in the *Journal*, it is only necessary to add that the Victoria Company are devoting much attention to the design and construction of bodies for these vehicles, so that any type of carriage desired by the purchaser can be turned out.

A representative display of "Prunel" cars was to be seen on the stand of Messrs. BRUN AND ROBERT. In their general arrangement all these vehicles follow standard lines. First we noticed a tonneau car fitted with a 6-h.p. De Dion engine, three speeds and one reverse, with direct drive on the top speed, and transmission by cardan shaft and bevel gear on to

Fig. 33.—The Lower Frame, with Motor, Clutch and Gear of the "Weller" Car.

of lift, controlled by centrifugal governor and hand accelerator, are employed. Both inlet and exhaust valves can be withdrawn by loosening one nut, while to fit new brasses to the connecting rods it is only necessary to draw one cotter pin. Large inspection openings are provided in each crank-case, enabling the connecting rod brasses to be taken up without dismantling the engine. A single camshaft operates the inlet and exhaust valves. Magneto ignition is adopted, two sparking plugs being provided for each cylinder, one being in reserve. The power is transmitted to the

live axle. A 9-h.p. tonneau with De Dion engine, three speeds forward and a reverse, and chain driving next claimed our attention, followed by a tonneau with 12-h.p. Aster double-cylinder motor. The largest car on the stand was a handsomely-finished Limousine, with Aster 16-h.p. four-cylinder motor, four forward speeds and reverse motion, and chain drive. Finally, we may refer to the 9-h.p. delivery van, similar to that which did so well in the A.C.F. trials in November last. It is constructed to carry a load of one ton in addition to two passengers.

The chassis of a 9-h.p. Beckett and Farlow car and a 16-h.p. tonneau car of the same type formed the exhibit of Mr. L. A. BECKETT. They are built by a Belgian firm of engineers to the designs of M. E. Mathieu, who has had a long experience with motor-cars. The vehicles comprise a number of special features, some of which have already been alluded to in the *Journal*. In outward appearance they follow the now generally accepted design. Under the bonnet in the fore part is set, in the smaller car, a single-cylinder vertical motor, rated at 9-h.p., the cylinder being 110 mm. diameter by 130 mm. stroke, and the normal speed 1,000 revolutions per minute; and in the larger vehicle a two-cylinder engine developing 16-h.p. A special form of centrifugal governor is employed, this working

Fig. 34.—The Beckett and Farlow Contact Breaker.

in oil in an extension of the crank case; it is adapted to act on the supply of mixture to the explosion chamber by means of a butterfly valve in the admission pipe; this valve being also controllable by a small handle on the steering column. The exhaust valve springs are in duplicate, and are not placed around the valve stem as usual, but at the sides. They work in tension, and are easily detached. The motor is fitted with electric ignition of a special form, having a wipe contact working in conjunction with a high-speed trembler coil. The circuit is completed by a cam touching the contact blade, at the same time lifting it, which causes it to make a connection with a platinum screw. The arrangement is such that, supposing the screw should have come out of adjustment and the blade does not touch it, the current will pass through the cam itself. (See Fig. 34.) By thus always having two paths open for the current to flow along, it is claimed to be almost impossible for a mis-fire to take place. By giving the contact-box half a turn, it can be detached from the engine, thus allowing it to be inspected and adjusted in the hand. The motor transmits its power through a friction clutch to a gear-box, and thence by universally-jointed shaft and bevel gearing to the rear live axle. Three speeds forward and a reverse motion are provided, all controlled by a single lever. The change-speed gear is of the usual shifting pinion type, but in the method of effecting the changes much ingenuity has been displayed; the operation of changing speed being effected by mere finger pressure on the side lever. Great care has been taken to reduce losses by friction, it being claimed that from 85 to 90 per cent. of the power developed by the motor is given off the rims of the wheels. The engine, clutch, and gear-box are so mounted that by undoing four lugs they can be dropped out of the frames.

The MOTOR TRACTION COMPANY, Limited, had a varied display of Salisbury single-cylinder 7-h.p. and 10-h.p. two-cylinder cars, and Germain 7½-h.p. two-cylinder and 15-h.p. four-cylinder vehicles, the details of which were given in our report of the same company's stand at the Stanley Motor Show in January last. The body work of these vehicles is of a high order. This is a department to which the company pay special attention, their exhibit comprising a special tonneau body in wood and aluminium, with bucket front seats.

A large display was made by the ANGLO-AMERICAN MOTOR CAR COMPANY, Limited—the name by which the Oldsmobile Company will in future be known. One of the most attractive features of the stand was the 20-h.p. Winton with a tonneau body, illustrated in a recent issue. The engine is of the two-cylinder horizontal type. All parts of the mechanism are completely enclosed, and water, petrol, and oil tanks are arranged under the bonnet. The water circulation is maintained by a gear-driven pump. The Winton planetary gear system of transmission is employed, giving three speeds forward and one reverse. Attention was also directed to the Oldsmobile car, which has now a new carburettor, in which the gravity-feed system has been adopted. Many small parts have been strengthened as a result of experience on English roads, artillery wood wheels being now fitted. The Royal motor-bicycle was also to be seen on this stand; this has been recently much improved in detail, Bowden rim brakes being fitted to both wheels. There are a number of novel points about the motor well worth attention, notably the vertical hollow radiating fins.

The REX MOTOR MANUFACTURING COMPANY, Limited, displayed a couple of "Rex" cars—a 10-h.p. tonneau and a 16-h.p. six-seated double tonneau. Both have the engine in front under a bonnet, driving the rear axle through a clutch, three-speed gear box, and bevel gear. The 10-h.p. engine has a vertical single-cylinder 115mm. diameter by 115mm. stroke, and runs at a maximum speed of 1,200 revolutions per minute. The 16-h.p. engine comprises two cylinders and runs at a normal speed of 900 revolutions. An illustration of the "Rex" 10-h.p. car was given in our issue of February 7th last.

MESSRS. HAYNES AND SONS, Limited, had on view several of the "Wartburg" cars, including a little two-seated car, fitted with a 5-h.p. two-cylinder vertical water-cooled motor, located in the rear of the tubular frame. Three speeds forward and a reverse motion are provided, the

power being transmitted through a clutch and bevel gearing to the rear axle. The little car is neatly finished, and can, it is stated, maintain an average speed of nineteen miles per hour. A similar car with the engine under a bonnet in the front was also shown; the usual three speeds forward and one backwards are provided, the maximum being twenty miles per hour. The gear box is built in one with the differential case and is made of aluminium, all gears being enclosed and running in oil. The brakes are the usual foot and hand-operated, and are very powerful. One of these cars was recently successfully driven up Church Hill, Caterham, with three passengers on board. A novel little delivery vehicle, with the same under-frame as the first car above alluded to was also shown; it is intended to carry a load of from two to three cwt., and is well adapted to the requirements of tradesmen. In addition they had on view an 8½-h.p. car of the same make, fitted with a two-cylinder engine. The transmission is on the now generally adopted lines of cardan shaft and bevel gear, three speeds and a reverse being available. A special point claimed for the Wartburg cars, which are of German construction, is that the loss of power between the motor and the driving wheels, due to friction, has been reduced to a minimum. A useful feature is the free use made of draw-off cocks, these being provided to each coil of the radiator and the cylinder water-jackets, so that there should be little danger of any water being allowed to remain in the radiator or jackets and freeze in extremely cold weather.

The MAUDSLAY MOTOR COMPANY's exhibit consisted of three complete cars and a chassis. One of the cars was fitted with a convertible omnibus body, designed to meet the requirements of country gentlemen whose places are some distance from the railway; in its wagonette form it serves as a roomy touring car, whilst the omnibus top makes it specially suitable for night work. It is fitted with the Maudslay 25-b.h.p. three-cylinder vertical balanced engine (Fig. 35), and the mechanism is in all respects similar to that of the car which took part in the Reliability trials last year. The second car was fitted with a tonneau body of improved design. It has more accommodation for luggage than is usual in this form of vehicle, and two hinged seats are fitted in the front corners of the tonneau, so that six passengers can be carried in an emergency. The mechanism is also of the 25-b.h.p. three-cylinder type. Removable casings of sheet aluminium are fitted, which completely protect the whole of the mechanism from mud and dust below the car, this being now a standard fitting on all the Maudslay cars. The third vehicle was fitted with a 25-b.h.p. double tonneau with canopy, built for Mr. F. W. Webb, of the L. & N.W. Railway. A chassis to illustrate the new features of the 1903 type was also staged, which embodies the latest developments in English and Continental practice, The inlet

Fig. 35.—The Maudslay Three-Cylinder Motor.

valves of the motor are mechanically actuated, and both inlet and exhaust valves are placed in line on the cylinder head, so that they are easy of access. A fan-cooled radiator is fitted, and forced lubrication is provided throughout, the oil being circulated by a special design of geared pump. We notice that the composite frame, constructed of rectangular solid drawn steel tube, into which ash is driven, is retained in the 1903 patterns. The triple cylinders of the engine, together with their combustion chambers, are a single casting, ensuring freedom from leaky joints, and allowing the use of a high compression. With the foregoing exceptions, the details of the car are similar to those described in these columns early last year, they having been found to give satisfactory results in practice.

STEAM CARS.

Messrs. FODENS, Limited, exhibited two heavy steam vehicles, one being intended to carry a load of five to six tons, having been built for a New Zealand firm, the other to carry four tons and draw two tons on a trailer, bearing the name of Messrs. Mark Mayhew, Limited. In general

the last twelve months over thirty of these wagons were turned out by Messrs. Foden, who are now arranging for an output of two vehicles per week.

The exhibit of the CHIEF BRITISH DEPOT attracted considerable attention owing to the fact that, in addition to the British-built Gardner-Serpollet steam cars, specimens of the Chaboche steam vehicles and Delahaye petrol cars were to be seen. The latter will be dealt with in their

Fig. 36.—The "Foden" Steam Wagon.

appearance the Foden wagons take the form of a small traction engine, behind which is mounted a platform upon which the load is carried. The boiler, which is of the horizontal multitubular type, forms the front part of the framework. The sides of the frame are constructed of channel steel, tied and braced together in such a manner as to secure great strength in the complete lorry. The boiler can be fired with coke, coal, or wood. The wagon is driven by a compound steam engine fixed on the top of the boiler. The cylinders are $4\frac{1}{2}$ in. and $6\frac{1}{2}$ in. diameter, and are fitted with high-pressure gear, by means of which both can, in case of emergency, receive live steam from the boiler, and each cylinder exhaust inde-

pendent section of our report of the Show. Of the Chaboche vehicles, a 12-h.p. chassis (Fig. 37), the parts of which were shown in motion by means of compressed air, and a complete double-phæton, were displayed. The generator, which is of the flash type, and fixed at the rear of the frame, is so constructed that the joints are removed from the high temperature of the fire-box, and as the number of joints has been reduced to a minimum boiler troubles are claimed to be consequently minimised. The fuel used is common paraffin. The burner is so arranged that it can be cleaned or "pricked out" by simply pressing a knob. An automatic regulator controls the feed-

Fig. 37.—Chassis of "Chaboche" Steam Car.

pendently into the chimney. The reversing motion is of the ordinary link type. The power is transmitted by spur wheels to the compensating gear shaft, and thence to the rear axle by an extra strong roller chain. The gearing is arranged for two speeds—9 to 1 and 24 to 1. The vehicle is mounted on laminated springs, with angle axle guards containing the sliding axle boxes, similar to those on the modern railway carriage. During

water and maintains a constant boiler pressure; while an automatic device is attached to the burners operated by the temperature of the generator, and worked independently of the pressure, to prevent any undue or injurious heating of the generator coils. The engine has two double-acting cylinders, with ordinary slide valves and variable expansion gear. Two speed gears are fitted, to avoid the necessity for working the engines

at too high a pressure on severe gradients, and also to obtain more complete condensation. The power is transmitted to the rear live axle by means of a cardan shaft. The whole of the working parts are enclosed in a dust-proof oil bath, and the lubrication is entirely automatic. The water tank is placed in front; under it is the condenser, which is cooled and made more efficient by means of a fan working on a prolongation of the engine shaft. The same exhibit included six of the latest models of the well-known British-built Gardner-Serpollet cars of 6 h.p., 12 h.p., and 20 h.p., and a chassis was also shown in operation by means of compressed air, affording an interesting opportunity to compare side by side these two rival, yet distinct, types of cars, both working with paraffin and flash boilers. The various forms of coachwork shown on the stand were of a very high order, ranging from the ordinary double phaeton to a most elaborate brougham or a sporting char-a-banc.

Fig. 38.—The Stanley Steam Car.

It has not been found necessary to make any important changes in the construction or arrangement of the mechanism of the Gardner-Serpollet vehicles. Several minor improvements have, however, been made, these including the closing in of the safety-valve on the dashboard, an alteration in the burner, which can now be detached without removing any nuts, and the rendering of the engine absolutely steam-tight.

Messrs. Joseph Cockshott and Co., Limited, showed the Stanley steam car, of which a description is given on page 938 of our issue of the 7th February last. Fig. 38 gives a general view of this car, which is the design of the brothers Stanley, who, it will be remembered by old motorists, were the introducers of the steam-car now known as the Locomobile. Superheated steam is generated by the boiler, a high degree of superheat being obtained without recourse to intensely heated metallic surfaces. The boiler consists of a copper shell bound by copper-plated steel wire. The engine is of the double-cylinder horizontal type, and drives the rear axle direct through spur gearing. There are a number of special and interesting features about this car to which we shall probably refer on a later occasion.

The NEW AUTOMOBILE COMPANY had on view specimens of the Miesse 6-h.p. and 10-h.p. steam cars and a chassis of the 6-h.p. type, enabling the details to be inspected. Since these vehicles were described in connection with our report of the 1902 exhibition at the Agricultural Hall, a number of improvements have been effected in them. The steam generator has been modified, and the pedal actuating the throttle is now arranged to work similarly to the clutch pedal of a petrol car—that is to say, the pedal is depressed when it is desired to shut off the steam. Paraffin is used as fuel, but the burner is now adapted to be started by means of petrol. The 6-h.p. car carries 16 gallons of water, which is stated to be sufficient for a run of 70 miles; the fuel capacity is sufficient for a run of eight hours, at an average speed of 20 miles an hour. We are informed that in the case of a 10-h.p. car, one gallon of paraffin has sufficed for a 25-mile run. The cars are fitted with equal-sized wheels, and in outward appearance closely resemble petrol vehicles, the boiler being located under the bonnet in front.

Unfortunately, the WARFIELD COMPANY, Limited, were not able to complete their steam car in time for the Show. The new vehicle comprises a number of special features. Steam is generated in an instantaneous generator, consisting of grids of specially constructed hydraulic tubing capable of resisting a pressure of 3,000 lbs. to the square inch. The water is forced through the generator tubes by an automatic pump of special design and construction, and is, upon entering the first grid, instantaneously converted into steam. In the following tubes it is superheated and expands. The engine is of the four-cylinder single-acting vertical type; it is enclosed in an aluminium air-tight case. The power is transmitted direct from the engine to the rear axle by single-reduction spur gear. Ordinary paraffin is used as fuel. The driving mechanism is hung upon a frame separate from that which carries the body of the car, so preventing undue shock to the mechanism when driving over rough roads.

A couple of "Toledo" two-seated steam cars, one being fitted with hood, were shown on the stand of the VICTORIA CARRIAGE WORKS, Limited.

We gave an illustrated description of these vehicles in our issue of January 24th last, so that we need only mention that the steam generator is a combination of the shell and flash type generators. Two innovations enter into the make-up of the boiler—first, that of a centrifugal separator within the shells, and secondly the addition of a superheating coil. The centrifugal action causes the entire body of water contained between the walls formed by the inner and outer shells to circulate horizontally. The rotary movement thus established throws the water against small dams or scoops placed at the mouth of each tube, which direct the water into the lower ends of the tubes, thus promoting rapid steaming.

ELECTRICAL CARS.

The KRIEGER ELECTRIC CARRIAGE SYNDICATE exhibited a couple of four-seated electrical landaulettes. The feature which distinguishes the Krieger from most other systems is the method of driving direct on to the front instead of the rear wheels. This plan has been found to give most satisfactory results in practice; the front wheels are driven by two independent four-pole compound-wound motors of 4½-h.p. each. They receive current from a battery of forty-four Fulmen cells of 180 ampere-hour capacity. The battery is divided, part being carried under the driver's seat, and the remainder underneath the passengers' seats behind. The controller is adapted to give six speeds forward, two recuperating positions, a reverse motion, and two electrical brakes. The Syndicate is, we learn, about to open a garage for electrical cars at Elizabeth Street, Belgravia, S.W., where every accommodation for the charging of batteries will be provided.

One of the Vehicle Equipment Company's electrical broughams was shown on the stand of the ANGLO-AMERICAN MOTOR CAR COMPANY, Limited. The driver sits behind, as in the case of a hansom, giving the passengers an uninterrupted outlook before them. The under frame is an important feature, this being of the pedestal type, with full elliptical springs, both fore and aft. The yokes enclose the sliding blocks of the axle members and give a universal movement to them, with all the desired flexibility. The battery is of the underslung type, comprising forty-four cells, one charge of which is sufficient for a run of from 35 to 40 miles. The double motor drive is used, the motors being of the General Electric type pivotally hung on the rear axle and driving the rear wheels through spur gearing. Expansion brakes are used on drums on the rear wheels. The controller is of standard General Electric type, of the series parallel order, giving four speeds ahead and two reverse, with an interlock between the reverse lever and main controller drum. On this stand were also shown an electrical delivery van to carry 10 cwt., and an electrical lorry (Fig. 39) to carry two tons. These are a new type to England, but are, we understand, meeting with a large adoption in the United States. In both vehicles the "pedestal" pattern steel underframe is employed. This, while giving a rigid support to the platform or body placed upon it, allows the axles to have a free vertical motion, thus taking up vibration from inequalities of the road surface. The battery is underslung in every case, and is contained in four distinct boxes, each of which can be readily removed by one man. The rear wheels are driven by a pair of General Electric Company's series-wound motors, having composite rawhide and phosphor bronze pinions which engage with steel spur rings bolted on the spokes of the rear wheel. The controller gives four forward and two reverse speeds. In the case of the delivery van, the battery consists of forty-four Exide cells, the capacity of which on one charge is equal to a run of forty miles, with the car fully loaded, on level roads of average surface, at a normal speed of ten miles an hour. The two-ton truck has the same make

Fig. 39.—The Anglo-American Company's Two-Ton Electrical Lorry.

of battery and the same number of cells, but is of a capacity of 200 ampere-hours. They will run the loaded car thirty to thirty-five miles on a single charge at a speed of eight miles an hour. Both vehicles are fitted with solid rubber tyres and expanding brakes, while we noticed that the rear wheels of the two-ton lorry were provided with sand boxes, the outlet to which is controlled by a pedal. The Baker Imperial Stanhope also formed a part of the display. This little vehicle, which has already been illustrated in the *Journal*, is fitted with a small battery sufficient to run the car about forty miles on one charge. Side tiller steering and pedal-actuated brake on the differential form part of the equipment, while the controller is adapted to give three speeds forward and reverse.

One of the most successful types of electric carriages in France is that of Messrs. Ch. Milde et Cie., whose system is now being introduced into this country by the LANCASTER MOTOR GARAGE. The Milde Company manufacture electric coupés, single and double landaulets, victorias, omnibuses, and light delivery vans, but confined their exhibit to a well-finished coupé. A compound-wound Milde motor of the differential type, carried at the centre of the hind axle, drives both rear wheels through internal spur gearing. The battery is carried partly under the driver's seat in front and partly beneath the passengers' seat behind, and is made up of 42 Heinz cells of 115 ampere-hour capacity. It furnishes sufficient energy to drive the car about 40 miles on a single charge. The steering is effected by a hand-wheel fixed to a vertical pillar to which the controller is also attached. The latter gives nine forward speeds, two electric brakes, two recuperation positions, and three speeds backwards.

COMBINATION PETROL-ELECTRIC CARS.

The combined petrol-electrical vehicle is now receiving the attention of motor-car builders, and already several are on the market, two being shown at the Exhibition last week. Figs. 40 and 41 illustrate the Milde combination four-seated landau exhibited by the LANCASTER MOTOR GARAGE. Under the driver's seat is mounted a 6-h.p. De Dion motor, direct coupled to a 5-kilowatt dynamo made by the same firm. Current is sent from the dynamo to a battery of 42 Heinz accumulators located under the seats, and thence to a compound wound motor suspended from the rear axle. The latter drives the internal gear rings connected with the rear wheels through pinions on its extended shaft. The controller is indicated at C (Fig. 40), and its handle by F; it is adapted to give eight forward and two reverse speeds, as well as two electrical-braking positions. E is the steering wheel, and L L' are the levers to control the mixture in the engine cylinder and the ignition. A pedal operates a powerful band brake on the outer rims of the gear rings on the rear wheels. Notwithstanding the extra mechanism involved by the combined system, the Milde

Fig. 40.—The Milde Combination Petrol-Electric Car.

a b Accumulators. c Controller. g Circuit breaking pedal.
B Electric Motor. d Petrol Motor and Dynamo. d Petrol Tank.
e Radiator.

composite landaulette is very little larger than the electric coupé referred to above. The chief difference is a slightly longer wheel-base necessitated by bringing the driver's seat more forward, but the appearance of the completed carriage is quite as elegant as that of the electric vehicle pure and simple. While examining the car it was pointed out to us that the generating plant on the vehicle can be made use of to provide electric light for the owner's house at night, a special switch and connections on each car being provided, so that the leads of the house-wiring system may be attached in place of the motor on the car. If it is not desired to have the petrol motor at work, when the car is only being used for town work, it can be used to charge the battery *in situ* at night, while for long runs the engine can be run on open country roads and shut off when passing through towns or villages. The motor is provided with an electrical governor, by means of which it is automatically stopped when the battery is fully charged. The engine can be started from the seat, this being done by a special switch converting the dynamo, temporarily, into a motor, the necessary current being supplied from the accumulators. The frame of the vehicle is also worthy of notice, this being of channel steel, curved to follow the lines of the lower portion of the vehicle body.

One of the novelties of the Show was the new combination petrol-electrical car which made its appearance on the stand of Mr. E. W. Hart late in the week. In outward appearance the vehicle (Fig. 42) closely resembles a petrol car, from which it differs only in the fact that the usual mechanical change-speed gear is replaced by a dynamo and an electric motor. The petrol motor is of 40 h.p., and comprises four vertical cylinders with mechanical inlet valves, honeycomb radiators, and all the other improvements which the 1903 season has brought to light. The engine is connected to a special four-pole dynamo giving 200 amperes at 200 volts by a flexible coupling. The engine, dynamo, and motor are carried on a special under-frame. No accumulators are provided, the energy generated by the dynamo, being conveyed by cables to the electrical motor; the latter is

connected by spur gearing running in an oil bath to a differential counter-shaft, from which the power is conveyed to the rear axle by side chains. The inclined steering wheel carries a lever which controls the throttle valve on the engine, while the speed of the car is varied by an electrical controller, adapted to give six forward speeds, one reverse, and two electrical braking positions. A noticeable feature of the car is the absence of the usual side levers. The main frame is of steel and wood, the front end being supported on the axles by double-inverted plate springs. In racing trim the car

Fig. 41.—The Milde Combination Petrol-Electric Car.

weighs under 1,000 kilos. It has a very smart appearance, and Mr. Hart informs us that its running is remarkably smooth and quiet. We shall watch its behaviour on the road with interest.

GENERAL.

Office fittings and furniture were displayed by the SHANNON, Limited, illustrate their system of letter filing and card indexing; while the Oliver Typewriter was the feature of the OLIVER TYPEWRITER COMPANY's stand, whose desks and office sundries attracted much attention.

Of minor import, but nevertheless useful to automobilists, were the various motor polishes and enamels to be found in the Gallery. The PAGE MANUFACTURING COMPANY showed a capital motor polish and cleanser, designated "Pago," as well as their enamel polish for carriage and enamelled parts. For painting the bodies of motor-cars "Lumo" has been introduced, and other specialities at the stand were worth more than a passing glance.

The AUTOMOTOR ACCESSORIES COMPANY had a stand of varied interest, including motor oils, to which we refer elsewhere. Rosser's patent lock nut, Bell odometers, Eclair coils, etc., were shown, and an electric lamp of 8 volts, which, fitted with a parabolic reflector, throws a light forward

Fig. 42.—The "Hart" Combination Petrol-Electric Car.

some 200 yards. The "D. R." carburettor for motor-bicycles, with an adjustable float adapted for petrol or alcohol, and several of Megevet's accessories, including a soldering apparatus of ingenious design and much used in French automobile workshops, were also shown. A new design in motor caps, specially useful for night riding, is a little novelty the company is introducing, this consisting of an ordinary peak cap, the folds of which can be drawn down to cover most of the face and act as a protection for the neck.

The export and import of motor-cars is being considerably facilitated by Messrs. SHELDON AND CO., whose experience in freightage in connection with automobiles is becoming both varied and extensive. Many of the foreign cars in the Hall were brought into this country in their charge, and during recent months they have had considerable business in despatching vehicles to South Africa, the Straits Settlements, and other colonies. At the present time they are arranging to send the motor-cars of private owners to the Riviera, and in this matter are saving their clients much trouble as well as expense. So completely do the firm cater for the transport of automobiles that they are prepared to design collapsible cases, etc., for vehicles of special size, thus taking the whole matter of conveyance into their own hands.

Messrs. BOULTON AND PAUL, Limited, showed a wood motor house, 15 ft. by 10 ft. by 7 ft.—a specimen of what they are building for a good many car owners in this country. These houses are constructed of strong deal-planed frames, the walls being covered on the outside with rustic joint weather-boarding. A motor-house, workshop, and shelter is also made by this firm, who are evidently going thoroughly into the matter of providing suitable accommodation for motor-cars owned by gentlemen in rural districts.

Parsons' non-skidders were illustrated in the *Journal* on January 10th last, since when ample opportunity has been given motorists of becoming acquainted with their merits. Experience has shown that no injury results to the outer cover from their use, owing to the constant travel that they make round the tyre, while tram lines and greasy roads can be safely negotiated when they are adopted. The PARSONS' NON-SKID COMPANY is certainly introducing a speciality that is becoming appreciated by automobilists.

Messrs. H. J. NICOLL AND CO. were present for the first time, and made a very pleasing introduction into the exhibiting world. Their specialities included a new motor coat of Irish frieze, fitted with fur wind cuffs, lined with wool, and interlined with chamois, with a Prussian collar and Raglan shoulders; it has a very effective appearance, while convenience and comfort is secured by the full skirt. Leather clothing for drivers was also shown, and special raiment for ladies, including coats of pony skin, grey opossum, etc.

An assortment of general-purpose tools was shown by Messrs. LAKE AND ELLIOT, whose specialities for motorists include a useful motor jack, known as the Millennium Express jack. Its working is extremely simple; the screw is lifted by a handle until the top bracket settles against the axle; the middle nut is then screwed down to meet the top of the standard, and the arrow of the nob having been pointed upwards, the vehicle is raised by merely working the handle. Tyre levers and petrol can openers were also shown on Messrs. Lake and Elliot's stand.

The DOHERTY MOTOR ACCESSORIES COMPANY made a bold display of engine bonnets, water tanks, radiators, carburettors, etc. Their bonnets have a capital fastening, well designed to prevent the rattling often associated with such parts, and their outline is distinctly good. Aluminium bodies, wings, and bucket seats are another speciality of the company.

The Anglo-American Oil Company were represented by specimens of their sealed cans for the transport of Pratt's motor spirit—with which their name is so closely identified—according to Government regulations.

An interesting display was made by the Auto Machinery Company, Limited, whose roller bearings for motor-cars consist of rollers, outer bush, and sleeve of well-tempered steel, and accurately ground, the cage ends of steel or gunmetal, with distance rods of steel. Although the first cost of this roller bearing is rather more than that of a plain bearing, the saving in oil and power is said to be considerable, as it is practically unwearable, and the reduced starting effort obtained, amounting to as much as 80 per cent. reduction, gives this bearing an enormous advantage.

The Star Accumulator was shown by the Société Electrique, whose representative is M. Paul See, of Lille. These accumulators are in celluloid cases, and are perfectly water-tight.

A representative collection of lamps, horns, and other accessories was staged in the Gallery by Messrs. Mann and Overton's, who thus made their first appearance as exhibitors in this line of goods.

The motor lamp, illustrated in a recent issue, was to be seen on the stand of Messrs. George Polkey, Ltd. The "Polkey" head-light burns paraffin and has many good points, not the least of which is the fact that dark objects can be discerned by its means at a distance of over thirty yards. The oil is contained in the foot of the lamp, which is always cool, and the circular burner has an attachment to prevent the wick from lowering. There is a simplicity about the construction of the Polkey lamp which is a great point in its favour.

Attention was drawn to the "Cup tyre" by the Shrewsbury and Challiner Tyre Company, Limited, who urge economy as an important point in its favour.

Messrs. A. W. Gamage, Limited, had two stands, showing voiturettes in the Large Hall, their accessories and clothing department being represented in the Arcade. Baskets for automobiles, levers of every description, repair outfits, goggles, motor-horns, ignition sundries, lifting jacks, etc., formed a prominent feature of the display. In leather motor-clothing, Messrs. A. W. Gamage, Limited, had several special features for drivers and mechanics. They are also giving attention to clothing for motor owners, which is rain, wind, and grease proof. A leather waistcoat, double-breasted, and with long sleeves, is specially suitable for motor

cyclists; whilst a double-breasted Chesterfield, made in double and treble-milled meltons, Scotch chevrons, or Irish friezes, was an exhibit of interest.

The "Ayrshire" motor coat was the central feature of Mr. T. H. Holding's show of garments, eminently suitable for motorists. A new dust coat was also shown, all the garments being characterised by good appearance as well as comfortable design.

M. Andre Godin's show of the well-known Ducellier lamps was the object of much interest during the whole week. They were shown in several sizes, including a headlight for voiturettes, fitted with an optical condenser, materially increasing the lighting power. In this ordinary calcium carbide is used. A motor-bicycle lamp, with which Ducellier's generator is employed, was also on view; this containing a charge of carbide which will burn for six hours. This generator requires no gas bag, and its convenient form should be appreciated by motor cyclists. M. Godin's excellent display of lamps was completed by a lamp for brougham use, which gives an ample light for reading. It can be worked in conjunction with a generator placed outside the vehicle, so that no unpleasant smells are occasioned within the carriage. Several motor horns were also shown, in sizes ranging up to 10 in. in diameter. These are fitted with a dust grille, and are made to fit on the dashboard or wings of the car. Made in brass or nickel, some of the special patterns were particularly handsome as well as effective.

One of the most interesting exhibits to the engineering visitor at the show was the "PRIMAT" alterno-rotary petrol motor, exhibited towards the end of the week on the stand of Madame Lockert. Without drawings it is impossible for us to clearly describe this ingenious engine, but as soon as the illustrations are available we shall refer to it at length.

The LONGUEMARE carburettors for both cars and cycles were also shown on the stand of Madame Lockert. These are too well known to need description, but we may briefly refer to the new carburettor for motor-bicycles, which is made in two types, one with float and the other without, both having jackets through which part of the exhaust gases may be made to pass. The firm have also introduced a special carburettor for vaporising alcohol.

Messrs. HEWETSONS, Limited, had on view a couple of the Hewetson motor-bicycles which have already been described in the *Journal*. Magneto ignition is adopted, while the carburettor and exhaust valve are controlled by a lever fitted on the left side of the handle-bar. A wide flat belt conveys the power to the rear wheel.

For the 1903 season the motor-bicycle of the REX MOTOR MANUFACTURING COMPANY, Limited, is being fitted with a 3-h.p. engine, mounted vertically, near the crank bracket. The cylinder is 78 mm. by 78 mm. stroke. Its main features have already been referred to in our pages, but we may mention the method of carrying away the exhaust. The usual exhaust pipe and box are dispensed with, and instead the exhaust box is ingeniously designed so as to be part of the motor itself. A V-belt transmits the power to the pulley on the rear wheel.

From BURBERRY'S came a large assortment of motor clothing, including lap robes for gentlemen and skirt sacs for ladies. Liveries for mechanics were also shown; and a special feature was made of the "Slip-on" coat, which is made in five different ways to suit the climatic conditions of different seasons.

Messrs. Anderson, Anderson and Anderson's, Ltd., showed a varied collection of waterproof and weather-resisting motor garments—a department in which they are achieving considerable distinction.

A stand of effective design in a light metal drew attention to the exhibit of the Britannia Foundry Company, whereon we noticed some remarkably clean castings in iron as well as aluminium. Tyre levers and pumps also found a place among their exhibits.

Some good examples of motor-car body building were shown. Messrs. HOLLOCK AND PRATT had an attractive tonneau body with fluted panels and boldly outlined in light mauve with borders of a darker hue. Another notable exhibit was that of Messrs. W. AND F. THORN, whose main feature was a tonneau made in natural wood. This was of very graceful design, and with the canopy top designed by the makers had an effective appearance. The framework is collapsible, falling to the sides in a few seconds when desired, and a front canopy is also provided which can be collapsed by the withdrawal of a couple of nut-headed screws. Aluminium as well as wooden bodies were also shown by Messrs. W. and F. Thorn, who made a very favourable impression on visitors.

AQUASCUTUM, LIMITED, made their first appearance as exhibitors with a good collection of motor garments, one of their specialities being a motor coat of pure wool, as worn by the King. It is claimed that the "Aquascutum" coat is porous, light and waterproof, while, being of wool, it does not court the effects of cold as do many garments now upon the market. The total weight of the motor coat for summer wear is under 50 ozs., while the heavy weight for the coldest weather only weighs about 6 lbs. Coats for ladies, motor rugs, motor caps, etc., were also shown on this stand.

Messrs. JOSEPH KAYE AND SONS, LIMITED, had their usual show of locomotive oil cans, in copper, brass, and steel, as well as seamless copper, brass and steel oil cans fitted with interchangeable spouts for all kinds of automobiles. Their improved oil economiser for storing quantities of paraffin or thick lubricating oils has been previously described in our columns, and will be found very useful for motorists living in out of the way districts. Messrs. Kaye and Sons have lately brought out a new squirt oil can fitted with a small pump which forces the oil into any part of the machinery as desired.]

(To be continued.)

CORRESPONDENCE.

CHAINS AND LIVE AXLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I do not quite follow Mr. Begbie in some of the points which he raises. The question at issue is briefly the relative advantages of the Panhard type gear, in which the engine drives a countershaft with a differential, by means of bevel gear, and this drives the road wheels by chains, or of the Renault type, in which the chains are done away with, and the differential is at the middle of a live axle, and therefore the use of chains is obviated.

It is often said by the advocates of chains that it is easier to mend a chain than a bevel gear. Certainly, and it is easier to put in a new sparking plug than mend a chain. What has this to do with it? If the chains did away with any of the gear, it would be a debatable point, but at present they do not. As a matter of fact, the one car that went hopelessly to pieces in the Paris-Vienna race from its gear going wrong was the Gordon Bennett Panhard. If it was so easy to mend, why did they not do so?

The fact is that, so far from making the differential more reliable, chains do the reverse. It is well known in engineering circles that small fast-running parts are more liable to wear and go wrong than large and slow-moving ones, and as the differential on the countershaft goes faster than the axle, it has more wear. Further, as this shaft is in addition to the axle, it has to be made very light to get the weight down at all. Mr. Begbie makes a great point of the bearings in a live axle not being good enough to keep the gears in mesh properly. I do not see any difficulty in this at all myself, the gear-box being usually a substantial casting; in any case, the differential on the countershaft is in a worse position as a rule, the gear-box there being usually an aluminium casting, and nothing like as rigid as the malleable one used for live axle gear-boxes.

I do not know in the least what Mr. Begbie means by saying that the "balance gear has to take up the greater portion of the weight of the car." In all the live axles I have seen the weight is carried entirely on the axle bearings, and the car could be towed along with every single gear wheel in the differential smashed to pieces.—Yours truly,

F. STRICKLAND.

THE NUMBERING PROPOSALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—On these may I write you selfishly and sincerely. Since 1898 I have driven all sorts and conditions of vehicles from a Beeston tricycle to a Panhard racing car. My legal expenses during that comparatively long time have amounted to £2 and costs, inflicted for driving at excessive speed. (As a matter of fact, on this occasion I was crawling along on a burst cover.) Inquiry has shown me that this is not by any means exceptional good fortune; it is astonishing to find so many others who have been equally fortunate. Can a stronger argument be advanced for "leaving well alone," "letting sleeping dogs lie," etc.?—Yours faithfully,

CHAS. SANGSTER, M.I.M.E., M.C.E.I.

MECHANICALLY-OPERATED INLET VALVE FOR 3½ H.P. BENZ CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "A. G. J.'s" enquiry relative to above, which appeared in the issue of the *Journal* for March 21st, I may say I have fitted the above to my 3½-h.p. Benz., and after running about 200 miles, have found it perfectly safe, and a great improvement. I think there should not be much danger of the exhaust gas firing the petrol in the carburettor, as there is a stronger spring provided to close the valve quickly. Of course, the timing would require to be correct to get the best results, and precaution should be taken to retard the sparking to ensure no backfiring upon starting the engine, otherwise the motor will run back rather more freely than with the automatic valve. I also found a stronger spring was required on the air inlet valve.

The advantages I find with this new arrangement are that I can run my engine much slower, enabling me to keep it going during the time I am in a customer's establishment, also I can drive on top speed in town at a much reduced rate, allowing me to keep on top where I was formerly compelled to reduce to slow. I can also take top speed on gradients where before I had to change to slow. I have run the car for the past eighteen months entirely for travelling purposes, and am very pleased to find an arrangement to improve the going, which the above certainly has done.—Yours truly,

R. STEELE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As there appears to be no independent reply forthcoming re the letter by "A. G. J.," on our mechanically-operated inlet valve for Benz cars, we should like to point out that the mechanical valve, being worked by an instantaneous cam, and the valve being fitted with a very strong spring, any possible danger of exhaust gases passing into the carburettor is obviated. Furthermore, the valve is bound to open full at commencement of suction stroke, and close instantly at completion of stroke, which

ensures a full supply of gas at all speeds at which the engine might be running. Trusting this will make it quite clear to your correspondent.—Yours faithfully,

RATCLIFFE BROS.

THE SPARKING PLUG "DISCOVERY."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice Dr. Hardwicke mentions that had I put the petrol rag under the gap spark it would have fired, as the petrol vapour is light. In this he is quite wrong; petrol vapour is much heavier than atmospheric air, a fact which cannot be too widely known. I can call to mind at least two accidents that this knowledge might have prevented. One case was one in which some wet petrol rags were carried over instead of under a naked light; in the other case some petrol was spilt in a motor inspection pit; a considerable time was allowed for the petrol to dry up, and then a lighted candle was taken into the pit; nobody was killed, but they will not do it again.

The following little experiment is quite safe, and will demonstrate what

I say. Put a small quantity of petrol into an enamelled steel jug (about the half-gallon size); hold it over a fire until just boiling. The heavy vapour in the jug can now be seen and pours out like a liquid. If a funnel is prepared with a piece of wire gauze over the bottom of it, the vapour can be poured out of the jug through the funnel and set on fire at the bottom, without setting fire to the vapour or petrol in the jug. If there is no wire gauze the fire will go up through the funnel and into the jug. Have a rolled-up cloth ready and, if this occurs, push it into the jug. There is not the least danger, however, if the experiment is done as I suggest. I do not say that the gap spark will not fire petrol, but that it requires a rich mixture, so that is fairly safe.—Yours truly,

E. ESTCOURT.

MR. MAWDSLEY BROOKE writes: "In reference to Dr. Hardwicke's letter, some two years ago, in conjunction with Mr. Estcourt, I experimented with petrol vapour, and we found that it did not rise, as Dr. Hardwicke states, but fell."

ALLEGED OBSTRUCTION OF THE POLICE.

Two Surrey policemen were taking the name of a motorist at Thames Ditton who was alleged to have been furiously driving his car, when Mr. E. C. Webb rushed up, and, according to the constables, said, "Take no notice of those liars. They have only timed you with a d—d oilcan." His interference caused a large crowd to collect, and resulted in the constables taking him into custody. On Monday he was charged at the Kingston-on-Thames Police Court with obstructing the police. The magistrates thought that Mr. Webb had interfered unwisely, discharging him with a caution.

A MOTOR-CAR ACCIDENT.

A FRENCHMAN named Alban Gentilh has surrendered to his bail at the Marlborough Street Police Court (London) to answer a charge of furiously driving a motor-car in Hyde Park, and causing serious bodily harm to William Smith, of Harleyford Street, Vauxhall. The Treasury prosecuted, and it was alleged that Gentilh, whilst driving the car at a furious rate, suddenly swerved to the "off-side," and knocked down Smith, who was riding a bicycle. Although ordered to stop, he took no notice, and drove out of the park at a rapid pace. The injured man was taken to St. George's Hospital suffering from concussion of the brain. The case was adjourned, bail being allowed in the sum of £100.

Where no alleged speed is given it is understood to be above the legal limit.
*Motor Cycle Cases.

At the Kingston Court on Monday an inspector assured the Chairman of the Bench that the justices had nothing to do with the trapping of motorists on the highway.

SERGEANT JARRETT proved the case against Mr. Goody at Woking. At the same court, for leaving a horse and cart unattended in Chertsey Road, Woking, on February 21st, William Cutler was fined 10s., Police-constable Eade giving evidence.

In the case against Colonel Crompton, the police evidence was to the effect that he was driving a car at the rate of 22 miles per hour. Defendant disputed the accuracy of the constable's watch, and said he had a Government apparatus on the car which showed the speed to be exactly 17½ miles an hour. He went on to say that if he was fined the magistrates would weaken his authority as vice-president of the Automobile Club, because if he brought up a Club member for being an inconsiderate driver, he might turn round and say, "You have been convicted yourself." The chairman of the Bench said a paper issued by the defendant's Club had been sent to him, and in it he found this amazing statement: "The Chairman of the Kingston County Bench was seen out measuring the Portsmouth Road." A paper which could publish that ought not to be read by respectable people. The Bench had decided to impose a penalty of £3.

In fining M. Walcker (who came from Paris to see the Motor-Car Exhibition at the Agricultural Hall), Mr. d'Eyncourt said he had even greater difficulty in arriving at the pace of motor-cars than he had in judging the pace of horses. It was admitted for the defence that the limit of speed was being exceeded. If there was any place in London where pace ought to be slow it was down Pentonville Hill. It was one of the sharpest hills in London. The pace of motor-cars did not seem to be so much one of standard as the circumstances under which it was indulged in.

ANOTHER summons for the excessive driving of a motor-car has been heard at the Arundel County Bench. The summons was against Ellen Wigley, wife of Frank Wigley, of Kingston Hill, and was for driving at 22½ miles an hour on the Arundel and Worthing road. The peculiarity of the case was that defendant, when timed, was motoring with her solicitor and husband to the Arundel Court, at which she defended another charge of excessive driving within Arundel. That case was dismissed, as reported in last week's *Journal*. Defendant did not appear, nor was she represented. A letter from her solicitor (Mr. Staplee Firth) ran: "I have advised my client not to go to the expense of defending this case, as it would cost more than if she is fined. But I ask you to refuse to allow your Court to be made the medium of such stupid and impudent barbarity." A fine of £7 10s. and costs was imposed.

NO LIGHT.

C. A. PASCALL, of Barnes, has been summoned for driving a motor-car at Slough after sunset without a red light behind. He was fined 10s.

POLICE TRAPS.

Now that the touring season is beginning news of police traps will be welcomed for publication in the *Journal*.

The police between Pontypridd and Taff's Well, on the Cardiff road, utilise the telephone in the capture of motorists.

The Surbiton Parade, on the Portsmouth road, is a place along which motorists should go carefully.

A POLICE trap is in active operation between Hove and Shoreham.

The police are timing cars over the road from London to Cambridge. Their great efforts are being made between Sawbridgeworth and Bishop's Stortford.

MR. G. H. WARNE, of Warne's Hotel, Worthing, writes warning motorists to be on the look-out on Sunday at Washington, just at the junction of the road which branches off to Steyning, about seven miles from Worthing. The police of the Steyning division are said to be determined to catch certain scorchers returning from Brighton, via Steyning. Motorists should drive slowly over Broadwater Common, one mile from Worthing, as many children run out of a school facing this road, and it has been found necessary to place a constable there every Sunday to protect them.

At the extreme end of Hove a constable frequently hides behind a wall.

At Lancing coastguard station, on the roadside, two miles from Worthing, there is a small hut or shed. Some time ago an unsportsmanlike constable jumped out of this and got something for his trouble. Motorists are earnestly requested not to wound the constable should one spring out of this hut.

THE temperature of the Worthing police is reported by Mr. Warne as normal. The speed of motorists entering Worthing is under the legal limit, with the result that there have been no fines. Last Sunday twenty-five cars passed through the town.

SEVERAL automobile firms gave facilities for their work-people to visit the Exhibition at the Agricultural Hall, among them being the Clarendon Motor Company, Limited, who ran a special saloon from Coventry for the benefit of a score of their workmen to visit the Hall. The manager, Mr. W. H. Hammon, believes that the expense of the organisation of such a trip is well repaid in the enlightenment of the workmen's minds as to what is being done in the industry.

TO CORRESPONDENTS.

All communications intended for insertion in this *Journal* or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, APRIL 11, 1903.

[No. 214.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE decision of the authorities to make a Government measure of the Bill for the holding of the Gordon Bennett Race in Ireland put an end to all doubt concerning its success. It is an exceedingly novel matter to be made the subject of Parliamentary action, and strongly illustrates the remarkable advance which has been made in motoring within the last few years. If the race comes off without any mishaps, the result will be beneficial to the whole kingdom, as it will hasten the introduction of other forms of advanced locomotion. There is no fear, however, that the usefulness of the horse will be minimised, says the "Freeman's Journal." The patient animal will be spared the drudgery of doing work which was unsuitable for him. Most people can remember the pitiful sight of a pair of tram horses tugging a big tram-car, and being stopped in the middle of some up-grade to set down a passenger. Then came most painful work to get the huge car in motion again. Electricity has spared us a continuance of this revolting sight; and other forms of locomotion will release thousands of poor beasts from the terrible existences they lead in carrying loads beyond their powers. The horse will be used for light and pleasant work, and his breed will be further improved when mechanical traction takes over the drudgery. The horse will be a friend, not a slave.

Touring Experiences.

ALTHOUGH the weather has this season not been very favourable to automobile touring, many motorists have not thereby been deterred from making excursions. Much useful information will therefore be added to the stock of experience of motoring tourists. Many valuable lessons will, no doubt, be learned by automobilists when, for instance, their vehicles are in want of small repairs far away from a well-equipped workshop, and we would like to hear from any of our readers who may meet with some interesting experience during their Easter tours. Motorists always like to read of the experiences of their *confreres*, particularly as to what trouble they had to contend with, and how it was remedied. A knowledge of how to cope with troubles and breakdowns on the road is one of the prime essentials to successful touring by motor-car.

A School for Chauffeurs.

MR. MARK MAYHEW, L.C.C., has written to Mr. Sidney Webb, L.C.C., who is a member of the Council's Technical Education Board, suggesting that the board should take up the instruction of motor-car mechanics and drivers. Here is a grand opportunity for the Polytechnics. There is no doubt that the theory and working of the petrol engine and the transmission of its power to the car ought to be taught in these modern institutions. There is an attractive opening for intelligent young men, who would be able, with instruction, to properly carry out the work which is now, in many cases, wretchedly performed by most incompetent individuals. Mr. Mayhew's views will be endorsed by many an owner of an automobile.

Common Sense from the Bench.

COUNTY magistrates are now joining hands with those motorists who advocate the abolition of the speed limit, and their adhesion to this view should influence many who have hitherto been inclined to favour numbering to withdraw from such a position. During the hearing of nine summonses against motorists the other day, the Chairman of the County Bench at Kingston, Mr. W. Y. Cockburn, said it had been stated that the Act under which "we proceed is practically obsolete, and that it ought to be repealed. I agree, and I think that the best thing to do would be to abolish the speed limit altogether, and leave only that section of the Act which makes motorists responsible for travelling to the danger of the public. But Portsmouth Road on Sunday mornings is one of the most dangerous roads in Surrey. Within half a mile nine down-grade roads lead into it, and the scores of people coming down these roads have to reckon with cyclists and motorists at the bottom. Yet, in face of these facts, the War Office recently sent a man to test the speed of motor-cars on the Portsmouth Road." We quite agree with the suggestion that the speed limit should be done away with, and that motorists should only be charged when driving to the danger of the public.

Motor-Car Lamps.

CONSIDERABLE comment has been made recently on the gradual increase in the candle power of the headlights carried on motor-cars. Although fairly powerful lamps are a requisite to safe travel at night, consideration for other road users would seem to point to a limit of power which should not be exceeded. The glare of the headlight of hundreds of candle power is certainly annoying to persons meeting a vehicle carrying such a light, and has a tendency to scare horses. The practice of carrying excessively-powerful lamps is a parallel to the use of unduly powerful horns. No definite limits can well be prescribed, and legislative regulation of these points would be objectionable. Automobilists should use their own judgment in these matters, remembering that if undue liberties are taken in these respects the public may retaliate through oppressive legislation. Much of the objection to powerful lamps can, remarks the "Horseless Age," be overcome by the use of suitable shields, which reflect the light on to the road instead of throwing it up in the air. Horses would then not notice the glare of the lights until within a very short distance of the vehicle, which would have passed them before they had time to cut any capers.

The Cost of Maintenance.

IN his magazine Mr. Henry Norman, M.P., attempts to answer the question "Can I afford a motor car?" But here the factors in arriving at some estimate of the cost are so various that no two agree. Taking, however, a £350 car for four persons and giving it fair usage the net yearly cost is put down at £176 after saving £40 in cab and railway fares and paying £104 for wages. This is upon a mileage basis of 4,000. For a car for two and employing no driver the cost is put down at £60, and this is rightly considered a justification of the purchase.

Noiseless Cars.

EFFORTS are being made by many makers to reduce the noise made by petrol cars, and just as the dust nuisance is being considered in trials of motor-cars so the noiseless running of the vehicles is being made a subject of study.

Electric and steam cars have proved attractive to many people on the ground of their quiet behaviour, and when the touring petrol car can be produced to travel as noiselessly as the most famous car of the year a great advance in business will immediately result.

A Fowl Story.

THE landlord of the "Cock" Inn at Hutton (Staffs.) was contemplating the traffic before his house recently, when a motor-car went hurtling by in the direction of Tutbury. A minute later one of his fowls was brought to him; it had

expired in consequence of pressure exerted by the motor-car wheels on the roadway, the poor hen being between the upper and lower surfaces. The driver of the automobile expressed his willingness to pay the estimated value of the fallen fowl—and this was done. The automobile may have greater effects on the poultry industry of the country than is apparent on first consideration. In his paper at the Automobile Club the other

A Roadside Incident.

week, Mr. M. O'Gorman mentioned that when touring near Gloucester on his motor-bicycle on one occasion he was trying to think out how it was that the natural process of elimination had not produced a breed of chickens that did *not* cross the road under wheels, when he felt a thud like kicking a football, and saw that the middle of his front wheel had bumped a hen, which went away squeaking hysterically. He thought he had broken its wing. The old lady who owned the bird caught it. Mr. O'Gorman got off and found nothing wrong, so he gave her sixpence, in return for which bounty she told him her secret. "When I wants a pullet killed I sends them into the road, and it's like as not it's killed and paid for, and I has my pullet into the bargain."

Navigating the Air.

MR. G. A. SMALLBONE, who for several years was manager for Messrs. Spencer and Co., the well-known aeronauts, and is now the president of the Greater Britain Aerial Navigation Club, is the inventor of an appliance for steering the ordinary

pear-shaped balloon, and will shortly put it to a practical test. Meanwhile, the Aero Club is arranging an interesting programme for the summer, and opportunities will be given for motor-cars to pursue the balloons at some of the meetings. The Crystal Palace and the Ranelagh Club will be the scenes of operation, a special night ascent being contemplated for June 6th.

Road Maintenance.

THERE was a practical ring about the paper by Mr. R. J. Thomas at the United Service Institution on Monday, and from his position as county surveyor of Buckinghamshire he was able to throw light on some abstruse points. There are 62 administrative County Councils in England and Wales, excluding the County of London and county boroughs. The Isle of Wight having its own special clause in the Act of 1888, and West Suffolk having no main roads, there are thus 60 county councils responsible for the 26,978 miles of main roads existing in England. Mr. Thomas showed that the annual cost of maintaining these roads is £2,120,332, or about £78 a mile. Thirty-eight of the councils maintain their roads by direct management, eighteen entrust the work to rural district councils, and four use both methods. The direct method is, in Mr. Thomas's opinion, easier and more economical, and in touching upon the quality and nature of material used he pointed out that slag has been used to an increasing extent of late years, especially for light roads. He called attention to a recently-patented invention of an engineer of great experience, whereby hot slag is mixed with tar by machinery and impregnated with its oil. The patentee claims to produce a surface impervious to moisture—the bane of road maintenance—and free from dust and mud. Mr. Thomas thinks that carefully cut and polished field flint will bear a greater crushing strain than almost any stone, but its qualities as a road material are only moderate. "In my opinion," he added, "the most reliable granite is that which, when machine broken, contains the largest proportion of cubical and the smallest of bruised, cracked, and chipped stone when passed through a powerful crusher, has at least 75 per cent. of its weight over one inch in size, absorbs the least quantity of water, and lasts longest under traffic."

London Traffic.

WITH regard to London traffic, Mr. Thomas did not venture to suggest what he considered the most desirable surface for metropolitan streets, but he remarked that the question of traffic of varying speed traversing the same road or street at one time was a vital one. This must be admitted by anyone who has seen the lumbering wagons crawling along Oxford Street, or several railway vans loading goods in Piccadilly Circus at the busiest time of the day. The custom of drivers keeping two or three feet away from the near-side kerb seriously reduces the capabilities of the street, without yielding an atom of good to the driver, whose thoughtlessness inconveniences overtaking traffic. These matters should be subject to police regulations. He would have no double line of tramways upon any road unless its width is at least 40 feet; and would, moreover, give every encouragement to motor-cars.

Developing Irish Industry.

APPARENTLY the central idea of the scheme for developing Irish transport, which Mr. Wyndham announced in the House of Commons last week, is the utilisation of motor-cars for the carrying of Irish produce from the farms to the best available market or the nearest port. Lord Iveagh and Mr. Pirrie are said to be providing all the capital necessary for the carrying out of their plans, and the profits derived from the working of the scheme will be devoted to the development of the country in other directions. A Conference on Irish Industries will be held in Dublin on the 15th inst., when some announcement with regard to the project may be expected.

In the Lake District.

RUSKIN abhorred the railway system that darkened the verdure of his favourite hills, and belched forth smoke against the whitewashed walls of the cottages by the Lakes. Whether he would have been better pleased with the automobile is a subject of pure conjecture. Anyhow, it is likely to put an end to the long-talked-of railway extension from Langworthy to

Pooley Bridge, at the foot of Lake Ulleswater, a limited liability company having been formed for the promotion of a passenger and goods automobile service in the Penrith district. The first regular service will be between Penrith and Patterdale, and should it prove successful an early extension to the whole of the Eastern Fellside district will be made.

In Fair Devon.

Ilfracombe summer traffic, and for this purpose a motor-coach service is to be established. The motor vehicles would enable visitors from Ilfracombe to go to Lynton and back for considerably less money than the former rates and in half the time, the route taken being by way of Berrydown and avoiding the Combe Martin Hill. There is no doubt that this is but one of many similar schemes of which something will be heard during the coming summer.

In fair Devon, too, the automobile is intruding, and in moving the adoption of the report of the Lynton and Barnstaple Railway Company, the other day, Sir George Newnes, M.P., announced the intention of the directors to develop the

typical Craven scenery. It is stated that one of the omnibus proprietors, whose headquarters are at Grassington and who has run a service of 'buses from Skipton to Buckden for many years, has transferred his interest in the concern to the Edinburgh firm, and has also parted with his two licensed houses, one at Grassington and the other at Kettlewell—an appreciation of the signs of the times that bespeaks intelligent foresight on the part of this livery-keeper.

An Echo of the Show.

THE value of the Agricultural Hall Motor Car Exhibition in practically popularising automobilism continues to find confirmation in the local journals published in various parts of the country. From a Darlington paper we learn:—"The motor fever is upon us. Motor-cars and motor-bicycles have become quite common in the streets of the sister towns, and only last week four well known Stockton gentlemen—to wit, Councillor T. E. Atherby, Councillor Stephenson, Mr. Richard Gaunt, and Mr. N. Downing—travelled to the Automobile Show in London and purchased cars of the latest design. One, I am told, essayed

[D. Lawrence.

On the North-East Coast.

OR more strictly utilitarian import is the good news from the north to the effect that in order to enter effectively into competition with the northern railway companies for the quick delivery of freight traffic, one of the leading shipping firms (Messrs. Furness, Withy and Co.) on the north-east coast is proposing to institute a daily service of fast steamers between London, Newcastle-on-Tyne, and other ports on that part of the coast. On arrival in port the traffic, it is stated, will be delivered over the surrounding district by a service of motor cars. In Lancashire the electric tramways are providing good facilities for the conveyance of goods as well as passengers, and the promise of comparison between the two rival systems of road transport is an event of considerable importance.

Other Developments.

THE rumour is current in Skipton that an Edinburgh firm has taken the preliminary steps for launching a motor-car service in that district, and that during the summer this class of vehicular traffic will ply for hire between Skipton and Buckden—a charming run of about twenty miles through

bringing the 'animal' home by road, but when somewhere near York it turned stupid, and had to be left for the night at a farm."

Esperanto—An International Language.

THE question of an international language has long attracted considerable attention, and since the Touring Club de France has taken an active interest in its development that known as "Esperanto" has come into much prominence in cycling and motoring circles in France. Whether it has a brilliant future before it, we are not, for the moment, concerned. Touring on the Continent has, however, become a favourite means of spending a holiday to many English motorists, among whom may be some of a linguistic turn of mind. To such, the "Students' Complete Text Book of Esperanto," by Mr. J. C. O'Connor, B.A., just published by the "Review of Reviews," should prove instructive, as it contains a full grammar, exercises, conversations, commercial letters, and two vocabularies. Esperanto Societies already exist in France and Sweden, and one has recently been formed in this country. With the view of increasing the number of English students, the author has endeavoured, with apparent success, to prepare a text-book

which, while being brief and clear, contains everything necessary for a sound knowledge of the language.

The 1903 Exhibition.

Now that the great Exhibition is over and bookings for the 1904 Show are well advanced, it is very clear that the business done was substantial and satisfactory. Before the event anticipations of good trade rose high, and all in the industry looked forward to a week of great things. Although in some cases the superlative hopes indulged in hardly realised the wild visions that had been pictured, there is no doubt that the exhibitors left the Hall with plenty of interested inquiries that are now being turned into orders. In the great majority of cases the business actually done at the Show was better than at any previous display, and the prestige of the Agricultural Hall Exhibition was enhanced in value.

Next Year's Show.

UPON this point we speak with confidence after a glance at the plans for next year's show. Firms have already booked their old places, and, in many cases, suggestions for extensions of space have had to be declined owing to the re-allotment of stands in close proximity, while restrictions have also had to be made. Next year the Minor Hall will be wholly devoted to heavy vehicles, while elsewhere, spaces are being taken up with an eagerness that bespeaks success.

The Mercedes Metre.

THE poet of the motor-car has arrived, and his "imperishable poem," as Mr. William Archer describes it, appears in the current number of the "World's Work." Mr. W. E. Henley has caught the rhythm of the motor and transferred it to lines that will live. His eulogy is a vivid conception of the automobile movement, and every motorist will appreciate this fine tribute to the newer experiences of speed which the motor-car has rendered possible.

"Hence the Mercedes !
Look at her. Shapeless ?
Unhandsome ? Unpaintable ?
Yes ; but the strength
Of some seventy-five horses :
Seventy-five puissant,
Superb fellow creatures
Is summed and contained
In her pipes and her cylinders.

Yet ask but a sign,
But a proof of her quality,
Handle her valves,
Her essentials, her secrets,
And she runs down the birds
(You can catch them like flies
As, poor wretches, they race from you !) ;
Ay, and becomes
As the Spirit and Mind
Of God's nearest approach
To Himself hath so willed it,
The Angel of Speed—
Speed in the Laugh of the Lord.

Thus the Mercedes
Comes, lo, she comes,
This astonishing device,
This amazing Mercedes,
With Speed—
Speed in the Fear of the Lord."

Considerations of space forbid the publication of further extracts from a poem of three or four hundred lines which is the most remarkable contribution to the magazine literature of the the current month.

A Pungent Introduction.

THE art of catalogue writing is not easily acquired—in fact, it has no settled standard by which to be judged. A well-known automobile firm has, however, obtained the services of a virile writer whose pungent vocabulary is utilised to introduce the technical details as follows:—A man who does not own a motor car has two courses open to him: he can buy one, or he can console himself by trying to believe the marvellous yarns which represent car owners as spending half their time in gaol, and the other half in a hospital. When the motor was a fabulous monster of which terrible tales were told by people who had never seen a car to others who knew no more about the matter, these stories were not hard to believe. Every new invention is at first regarded with dread. When railways were proposed, it was very gravely asserted that the sparks from the engines would set fire to every cottage and risk within half a mile of the line. The slanders upon the character of the motor-car, if one takes the trouble to analyse them, may be reduced to four elementary falsehoods: that the car is dangerous; that it often refuses to move; that its owner is perpetually harassed by the police; and that the cost of up-keep is inordinate. Now let us put four home truths against these four silly stories:—(1) A motor-car is safer than a vehicle drawn by a horse, much safer than a vehicle drawn by two horses, and much safer than a horse ridden by a man. (2) A car does not stick unless you stick it. (3) The police no longer persecute automobilists. (4) It costs less to keep a car than to do less work with horses." For the arguments by which these points are reached, readers must be referred to the catalogue of the Farman Automobile Co., Ltd.

Racing at Nice.

AT the last moment official permission to run the mile and kilometre races on the Promenade des Anglais at Nice was granted, the events being held between 5.30 and seven o'clock on Tuesday morning. Special measures were taken to prevent the public from even approaching the course. The chief performance in the contests was that of M. Serpollet, who covered the kilometre, with a flying start, in 29 1-5 sec. The time does not constitute a record. Nor were the times lowered for the mile, which the winner (Braun) covered in 1 min. 3 4-5ths secs. on a Mercedes.

AMONG the motorists passing through Dulwich on Sunday was the Prime Minister.

MESSRS. DE DION-BOUTON, LIMITED, have removed from Brook Street, W., to larger premises at 10, Great Marlborough Street, Regent Street, London, W.

ON the 15th inst. Messrs. Corrigan and Company will hold a motor-car auction at the Earlsfoot Rink, Dublin.

TWO Gobron-Brillie racers put in their appearance at Nice on Friday last week. They are fitted with engines of no less than 110-h.p. The four-cylinders have eight pistons.

THE Prince and Princess of Wales paid a visit to Hampton Court Palace on Sunday afternoon, when they travelled from London by motor-car to see the Duke of Teck, who is in command of the Palace guard.

MR. HARVEY FOSTER, the President of the Sheffield Automobile Club, has offered two challenge cups to be competed for by members of that organisation. The first contest will take place on May 16th, on the Padley Wood Hill.

MR. WALTER LONG, replying to a question in the House of Commons on Tuesday, said he did not think legislation as to the length of automobiles would be practicable. He hoped, however, to make proposals for the general regulation of motor-vehicles.

WE have received a number of new catalogues and circulars from the General Electric Company, Limited. One is a copy of the eleventh edition of section "W," which is devoted to electrical wires and cables, while one of the circulars describes an electric motor-car bell and a motor-bicycle ignition coil lately introduced by the company.

GORDON BENNETT RACE NOTES.

WE shall be pleased to receive the names and addresses of qualified repairers, etc., in Ireland, so that they may be notified to motorists who will be crossing the Irish Sea for the Gordon Bennett race. In our next issue we propose to give the names of some leading firms supplying petrol, etc., and shall be glad to have the assistance of readers on the other side in making this list complete.

THE unfortunate death of Count Zborowski has naturally led many to inquire as to what effect it is likely to have upon the prospects of the coming event. It should be remembered, however, that the conditions between the hill-climbing race on the La Turbie road, and those in the Irish counties are entirely

SOME enthusiastic Manchester motorists have chartered one of the Manchester and Dublin Steamship Company's steamers for the outward and homeward journey from Cottonopolis to Ireland in connection with the race. Mr. T. F. Dodd, of Trafford House, Urmston, is one of the party, and local motorists desiring to join the contingent should communicate with him ere long.

GREEN and red flags will be used to warn the competitors when they are approaching curves on the route.

MR. G. N. JESSOP, of Maryborough, has offered to find accommodation for four or five cars at his stores free of charge during the Gordon Bennett race.

DURING the automobile fortnight in Ireland some interest

The Austrian Military Authorities Accustoming Horses to the Motor-Car.

--- [Allgemeine Automobil-Zeitung].

different. In the one case there was a winding course with at least one competitor unused to his vehicle, whilst in the other there are convenient and long stretches, with comparatively few sharp turns; but more than that, each of the competitors will be perfectly well acquainted with the vehicle he is driving, and this constitutes a factor of safety leading to the confident hope that no such unfortunate event will mar the prospects of the great event.

THE Northern Railway Company of France and the South-Eastern and Chatham Railway Company have offered the French Automobile Club to supply any members desirous of visiting Ireland to see the great race with first-class return tickets between Paris and London, at the price of second-class return tickets.

ing motor-cycle events will be decided. On the Saturday following the great race there will be three races over the course mapped out in Phoenix Park, Dublin, and on Tuesday, July 7th, there will be three similar events over the four-mile course at Newcastle. The races will probably be for three classes of vehicles: the first for touring cycles up to 2 h.p., the second for touring or racing cycles up to 3 h.p., and the third for cycles of over 3 h.p.

THE Eliminating test for the American Gordon Bennett team is to be held to-day (Saturday).

THE demand for high-class pleasure horses is reported to be as great or greater than ever, while the demand for the utility animal of commerce is steadily on the decline, the development of mechanical traction being held as the cause.

D

CONTINENTAL NOTES.

BY "AUTOMAN."

TO say that a profound impression has been caused on the Continent by the terrible death of Count Zborowski hardly expresses the situation adequately. The news of the tragedy began to filter through in automobile circles in Paris by Wednesday noon, with exaggerated details, but it was not until the morning papers of Thursday appeared that the shock came to the public. Automobile racing has come to be quite a feature in French modern life, and almost everyone in all grades of society knew by name and reputation the late Count, who was a familiar figure at the A.C.F., and better known as the capitalist of the Falconnet tyre manufactory.

To say that the death of Count Zborowski is universally regretted, not only by all those who knew him personally, but also by the great mass of automobilists, and all those who take an interest in automobilism on the Continent, is only stating the plain facts, for he was known and recognised to be a first-class sportsman. He raced for racing's sake, and ran straight, with a courage which nothing daunted. The Paris-Vienna race taught this lesson to everybody, for he started in this competition, one may say, single-handed. I mean that there was no pro-

Count Zborowski's Car after the Accident.

vision made for assisting him over the road, and, unlike the case of those who ran for Panhard-Levassor, Mors, Renault, and the leading makers, who had relays of men all along the roads from start to finish, ready to assist with information and supplies the competitors who were driving their cars, Zborowski had only himself to depend upon. I well remember his blue-painted Mercedes, with the No. 26 painted on the front of the honeycomb radiator, rushing to the winning-post at Belfort, at Bregenz, and at Salzburg, and I shall not easily forget that memorable day on the Vienna racecourse, when his car came up in a cloud of dust, the real winner of the Paris-Vienna contest. For, in spite of the fine which was added to his time through a quibble with which the actual speed of his car and the actual time occupied in running the race had nothing whatever to do, the Count, outside circles who are interested otherwise, is always considered on the Continent to be the real winner of the Paris Vienna motor-car race of 1902.

THE sad accident on the Turbie Hill, which robbed us of a leader and which may have other far-reaching results, disastrous to automobile interests, I will describe as I had it from an eye-witness. It was 9 o'clock on Wednesday morning, and the sun shined brightly out of a Mediterranean blue sky; everything

looked as if the Turbie contest was going to be a great success. The Count's 60-h.p. Mercedes, painted blue like his Paris-Vienna winner, was fifth to start. Under ordinary circumstances the Count was rather a placid man, and particularly cool and calm. But on this particular morning he seemed to be nervous and agitated, and instead of, as was his habit, attending to his own car, and taking no notice of the others, he went from car to car in an agitated manner. Werner, Degrais, Hieronymus, and Gasteau had gone off one after the other, and it came to the Count's turn. He was so impatient that he made a false start, and had to be stopped. The course of the Turbie Hill, as it was arranged for this year's competition, consisted of a short distance of flat before the ascent began, a sharp turn to the left, about a quarter of a mile from the start, and a steep incline on the right hand side of the road. Just about the centre of the bend the road is bordered by perpendicular rocks. The Count started on his second speed, but almost immediately got in his third, and then his fourth, and swung wide open his gas and ignition levers, to get the utmost possible speed out of his car. Arriving at the corner, he rather hugged the right hand side of the road towards the rocks, intending, no doubt, to make a great sweep round. His mechanic, Baron Palange, who was seated on the footboard, and his head out of sight, was seen to raise his hand off the splash board—then the right hand side of the car grazed the rocks, and all was over in a second. The contact with the rocks at the fearful speed stopped the car, which skidded right round to the left, thus throwing the unfortunate Count against the face of the rock, where he was instantly killed. The more fortunate Baron, seated as he was on the left hand side of the car, and safeguarded by the splashboard, was thrown out into the road and only slightly injured.

NEARLY everybody puts the accident down to excessive speed at the bend, but in my opinion this is a mistake; I think a careful study of the conditions, as I propose to explain them, will bring automobilists to my conviction. There is no doubt that the speed was great. It is computed by Jellineck and others at 106 kilometres per hour, though how they arrive at this figure I am at a loss to know. Because the gas lever was wide open and the fourth speed in, it is argued that the speed must have been 106 kilometres an hour; but in this calculation it has been forgotten that the car was climbing a steep incline, so that, to calculate the exact speed, it would be necessary to take into consideration the weight of the car, the incline, and the wind pressure. Be this as it may, the accident, in my opinion, was not caused by the speed, even if this was 106 kilometres an hour.

THE cause of the accident was undoubtedly a momentary error of judgment on the part of Count Zborowski. If those who are constantly on the road will consider for a moment, they will remember the occasions when, in turning a corner, they have hugged too much the side of the road opposite to the turn, and when they found it difficult to keep out of the ditch. Now, if the high speed was the cause of the accident, the car would have overturned, which it did not do. The unfortunate Count took too wide a sweep, instead of taking a sharp cut at the left hand corner, and this wide sweep would gradually store up a centrifugal force, not only in the car, but also in the two occupants, and the reason that the Baron de Palange was seen to lift his hand was without doubt the cause that his body was swung over out of balance towards the Count. It must be remembered that the Baron de Palange's head was below the splashboard, to keep out of the wind, and he, therefore, did not see the danger. The Count's body would be also swung out towards the road, which would make it all the more difficult for him to get round the corner.

If additional proof of this theory be required, I should find it in the fact that Bauer was killed on the 30th March, 1900, at exactly the same place, on a car which could not go half as fast, whilst since then there have been two competitions round the same corner on faster cars, and under worse conditions. Even

granting that Count Zborowski's car was going at a higher speed than any of the four cars that preceded him on the 1st inst., there could not be a very material difference in the speed.

As was the case in the Paris-Berlin race, when Brasier had the misfortune to run over a child between Epernay and Rheims, the French Governmental authorities have completely lost their heads. There was, however, an excuse for hasty action in 1901, for at that time the general public in France were against motor-racing. The daily papers howled for its suppression, and the Government had to face the interpellation of M. Gautier de Clagny and a clamouring Chamber. This time almost all the daily papers and the great majority of the public have had nothing to say, except to express regret at the loss of a good sportsman. The Minister of the Interior, M. Combes, notwithstanding, not only put the veto on the Turbie hill-climbing trials, but stopped the kilometre and mile races on the Promenade des Anglais.

THERE was some excuse for stopping the Turbie hill-climbing competition, for, after all, there is little sense and no utility in holding such a competition on a dangerous, sinuous hill. The winning car is not necessarily the best car: it may, on the other

depended upon this contest for large orders, and they are naturally indignant that the authorities should have ruthlessly done them this injury.

Of the Nice meeting there only now remain the brake test and the *Concours au Bidon*, but all the enthusiasm is gone, and no one takes any interest in what is left. For the brake tests Rochet-Schneider had the monopoly of the day, and proved their car could be stopped in 6 metres, going forward, and in 1.85 metres going backward.

THE Spanish part of the Paris-Madrid course has been definitely fixed. Every level crossing, turn in the road, *dos d'ane*, *caniveau*, village, and every bridge has been classed, marked, and indicated, so that the competitors will have no difficulty in knowing the road, if they pay attention to the instructions. There are only seven neutralisations. Sixteen chronometers are being sent from Paris to the different controllers in Spain, and trial runs are being made in and out of the controls, so as to teach the Spanish timekeepers their work. Each provincial committee has at its head the dignitaries, municipal and prefectural, so that the organisation of the race

The Nice Week—The Touring Cars at St. Martin-Vesuble.

hand, be an inferior car, driven by a man who turns the corners at the greatest speed, and risks the overturning of his car. It would be more logical and much wiser to seek out a long, straight hill, for instance, Gailon, where the trial of cars would bring out the points of the best vehicle distinctly and almost independently of the driver.

To stop the kilometre and mile races on an asphalt track, perfectly straight, and from which the public are absolutely excluded, is not only ridiculous, but it is unworthy of anyone placed in a serious and responsible position. The injustice of the proceedings can be gauged if one considers for a moment that every year both jockeys and gentlemen are killed in flat-racing and steeplechasing, and yet no one thinks of stopping race meetings on account of such accidents. Yacht racing, too, has its fatalities. Football claims its victims, as does almost every sport, and yet no one thinks for an instant of interfering, except to take prudent and useful precautions. Large sums of money have been spent by various automobile manufacturers in view of the mile and kilometre competitions of Nice, and all this money will be absolutely thrown away. Several makers

in Spain will be as complete as possible and thoroughly official. Prizes are rolling in from every side, and both the Duc de Asturias and the Infante Isabelle are giving awards. The town of San Sebastian gives two, and other towns along the road will no doubt follow this example. The winner of the race will have nothing to complain of from the point of view of prizes. The number of entries stands now at 254, Nos. 251 and 252 being taken by Bat motor-cycles. The entries with a single fee will close on the 15th inst., after which date until the 15th of May double fees will be charged.

THE "Circuit des Ardennes" has been definitely fixed for the 20th and 21st of May. It is to be a two days' event, so that the tourists (cars, voiturettes, and motor-cycles) can run together on one day, and the heavy cars and light cars together on the next day. The course on the first day will not be the same as last year, but will be 91½ miles in length, without neutralisations, and also without any level crossings. Twice round will constitute the race. For the light and heavy cars last year's course will be maintained—that is to say, 317½ miles. The meeting, coming just as it does before Paris-Madrid, cannot possibly be

very complete, but may, on the other hand, serve as a training ground for some of the starters in the big event.

THE Alsace branch of the De Dietrich Co. have just completed a new 24-h.p. car to the designs of Signor E. Bugatti, a young Italian engineer, who lately drove the vehicle from Niederbronn to Vienna, where, at the exhibition, it attracted considerable attention. The engine is on novel lines, comprising four cylinders cast in two pairs, and having no water jackets in the usual sense of the word. Instead, each pair of cylinders is enclosed in an aluminium case, through which the water is circulated. To admit of this, it has been necessary to arrange the sparking plugs and the inlet and exhaust valves directly on the top of the cylinders. Signor Bugatti, who is now head of the technical department of the De Dietrich Co.'s Alsace works, is building a special 50-h.p. racer for Paris-Madrid. This will have a four-cylinder motor on the lines of the one referred to above. The frame will be of tubular construction, the tubes being used to carry the cylinder-cooling water. The car will be long and narrow, the wheel base being no less than $11\frac{1}{2}$ ft. and the track under 4 ft. The driver's seat will be located directly over the rear axle.

THE programme of the Aix-les-Bains "automobile fortnight" has been drawn up by the Automobile Clubs of Avignon and Rhone as follows:—June 18th, Mont-Ventoux Hill Climb; 19th, "Caravan" Avignon-Grenoble; 20th, arrival at Aix; 21st, Battle of Flowers; 22nd, Automobile paper chase; 23rd, Road Race from Albertville to Montmelian and back; 24th, Dent du Chat Hill Climb; 25th, Kilometre trials near Aix; 26th, an excursion; 27th, run from Aix to Grenoble; and 28th, Laffrey Hill Climb.

THE *Concours au Bidon* was run off on Sunday at Nice. In this, each competitor was given 100 grammes of petrol for each 50 kilogrammes of the weight of the car complete in running order, the vehicles being run until they came to a standstill. The results are appended:—

	Car.	Petrol allowed Kilog.	Distance run. Kil.
1.	F. de Millo	4 h.p. Renault	1 ... 33.707
2.	Balon	6 h.p. De Dion Bouton	1.08 ... 31.483
3.	Portal	6 h.p. De Dion Bouton	1.066 ... 31.54
4.	Cannet	6 h.p. Panhard	2.505 ... 29.27
5.	Balot	12 h.p. Georges Richard	2.165 ... 26.03
6.	Dumas	8 h.p. Rochet-Schneider	2.255 ... 24.470
7.	Lafrete	6 h.p. De Dion	1.3 ... 24.28
8.	Marchal	12 h.p. Rochet-Schneider	2.24 ... 19.63
9.	Joliot	16 h.p. Rochet-Schneider	2.815 ... 19.08
10.	Dupre	6 h.p. Panhard	1.865 ... 18.653
11.	Bary	12 h.p. Mors	2.495 ... 24.220
12.	Tiran y	4 h.p. Renault	1.145 ... 13.

THE body of Count Zborowski was transferred on Friday morning last week to a special carriage at the Nice station of the Paris-Lyons-Mediterranean Railway to be conveyed to Melton Mowbray. Wreaths of flowers, sent by the Automobile Clubs of Nice, France, Great Britain and Ireland, and Germany, were laid on the coffin. Brief addresses were spoken by Count de Montsaunlin, vice-president of the Automobile Club of Nice, and Baron von Zuylen, president of the Automobile Club of France.

THE Sheffield Automobile Club have had a pleasant meet at Bawtry, on the Great North Road. The following members had arrived when the club photo was taken, viz., Messrs. E. F. Coupe, 8-h.p. Daimler; Ben Hind, 6-h.p. Darracq; E. H. Hill, 6-h.p. Benz; Jas. Barber, 12-h.p. Belsize; Brooke Shaw, 5-h.p. Decauville; J. H. Pickford, 10-h.p. Wolseley; A. J. Blyde, 3½-h.p. De Dion; J. and A. J. Robson, 6-h.p. Locomobile; D. Bookless, 6-h.p. Marshall; Percy Thompson, 8-h.p. M.M.C.; W. Watts, 6-h.p. Humber; A. T. Dewhurst, F. B. Cawood, H. E. Mallinder, J. Walker, and F. W. Oates, on motor-tricycles; W. James, E. M. Machin, and W. Coldwell, on motor-bicycles; T. W. Revill and G. Flather, 3½-h.p. quad.

SOME USEFUL NOTES.

ALWAYS carry a spare washer with the spare plug. To detach a washer from an old plug requires a good deal of time and still more patience. If no spare washer is to hand, a ring of well-oiled brown paper will form an efficient temporary substitute.

A FEW drops of oil should occasionally be applied to the "exhaust" tappet, so that it may percolate down between the tappet and the guide in which it works. The lubrication of this guide, which on some engines depends on the oil splashed up by the "half-time" wheels, is often inefficient and may not be enough to prevent "seizing" of the tappet.

UNLESS there is a weak spot in your tyre and you fear a burst, always pump it hard. When the car has a full load on board, the tyres should never splay more than half an inch. The disadvantages of driving on a soft tyre are (1) increased tendency to skid; (2) "rolling" of the tyre in the rim, tending to tear off the beading; (3) increased liability to puncture.

BOILS on tyre covers are due to accumulation of dirt from the road between the layers of rubber, which has gained admission through a cut. The dirt should be carefully removed with a pen-knife or other suitable instrument, the original cut being, if necessary, enlarged for the purpose. The chink left in the rubber should next be cleaned out with petrol, and its walls solutioned together. The tyre must not be used for eight hours, so as to enable the solution to "set" thoroughly. If a boil is neglected it will gradually increase in size, and so weaken the cover at this spot as to prepare the way for a burst.

AUTOMOBILISTS have been so much accustomed to receiving spirit for use in their engines of very slight variation in density that they have become indifferent as to testing its specific gravity. But the spirit supplied sometimes varies from the density of .680 to .685 degrees at 60 degrees Fahr. Hence the necessity of occasional tests being made to find the specific gravity; correction should be made for the temperature unless it happens to be exactly 60 degrees Fahr. The rule is, according to Messrs. Carless, Capel and Leonard's little hand-book:—For every two degrees which the thermometer of the Fahrenheit scale registers above 60 degrees, one degree should be added to the reading of the densimeter, and *vice versa* for every two degrees which the thermometer may register below 60 degrees Fahr., one degree should be deducted from the reading of the densimeter. To save the trouble of thinking of this rule and making the calculation, the following table shows what the reading of the densimeter will be at various temperatures from 30 degrees Fahr. (2 degrees below freezing point) up to 90 degrees Fahr. if the petrol is of the proper standard sp. gr. .680. The first and third columns represent the temperature as shown by thermometer, and the second and fourth columns indicate the correct reading of the densimeter for the corresponding temperature:—

Densimeter			Densimeter		
Deg. Fahr.		Reading.	Deg. Fahr.		Reading.

MOTOR-CYCLING NEWS.

THE head-quarters of the Motor Cycling Club during Easter will be the Red Lion Hotel, Salisbury. A start will be made from the Marble Arch on Good Friday morning at 10.30, calling at the Town Hall, Staines, at 12 o'clock, for South London members to join there. The members taking part in the Club's Easter Tour will return to London on Monday.

MEDALS are to be awarded by the Alpha Motor Cycle Club, of Brooklyn, U.S.A., for the best attendance on club runs during the year. The system to be adopted is a novel one. One point will be deducted for all failures to reach the fixed destination, and another if the rider does not make the return trip, the awards, of course, being made on the total scores at the end of the season.

IN another column we publish the views of Mr. E. H. Arnott with regard to the classification for motor-bicycles, which should be carefully studied by English makers. He hopes that the Automobile Club will accept the Continental ruling which has proved so satisfactory, both from the point of view of

The Humber Motor-Tricycle and Traller.

sport and mechanical improvement, and will not inaugurate a new classification at variance with that of every other country.

ON the 25th ult. the motor-cycle section of the Austrian Touring Club held a consumption trial for motor-bicycles over a 100 kilometre course near Vienna. The contest was confined to machines weighing under 50 kilogrammes, with an allowance of 7 kilogrammes for those having magneto ignition. Although speed was not a factor in the result, only those attaining a rate of over 25 kilometres (15½ miles) per hour were eligible for awards. There were fourteen starters, of whom all but one finished. The first three, together with their petrol consumption, are shown in the following table:—

		Consumption of petrol.
1. Herr Bayschlag	1½-h.p. Opel	2 lbs.
2. Herr Frén	1½-h.p. Helios	2½ lbs.
3. Herr Curjel	1½-h.p. Laurin-Klement	3¼ lbs.

OWING to the greasy state of the track at Canning-town on Saturday only one of the five matches arranged between F. W. Chase and H. Martin was decided. The result was:—One Mile Match (standing start): H. Martin beat F. W. Chase by six yards. Time, 1 min. 34 2-5 sec. A Five Miles Handicap resulted thus:—T. E. Newman, 2½-h.p. machine, 8 sec. start, first; J. F. Crundall, 2½-h.p., 5 sec., second; H. Collier, 2½-h.p., 5 sec., third; T. H. Tessier, 3-h.p., 5 sec., fourth. Won by 150 yards; nearly a lap between the next two. Time, 7 min. 33-5 sec.

IN response to several representations, the committee of the Scottish Automobile Club (Western Section) have agreed to form a motor-cycle section in connection with the Glasgow to London non-stop trial, 13th and 14th May. The entry fee is four guineas, and the last date for receiving entries is 1st May.

THIS week we select for illustration the motor-bicycle recently put on the market by the Swift Cycle Company, Limited. The

Fig. 1.

frame of the machine is of strong construction, allowing the engine to occupy a space midway between the two wheels, and fairly low down. It is provided with a duplex head built on the same lines as the old Swift multicycles. The engine is a 2-h.p. "Ariel" placed vertically in a looped frame, to which it is attached by three brazed joints bolted to the aluminium crank chamber. The carburettor is of the surface type, with the usual throttle and gas mixture levers A and B on the top bar. At C is the speed control lever, which advances and retards the timing of the explosion by rotating the fibre commutator block around the two to one shaft. This lever is provided with a spring contact against a notched quadrant E, by means of which it may be kept in a positive position when once adjusted by the rider. When the timing of the ignition is sufficiently retarded a trip on the timing lever comes in contact with an exhaust valve lifter. The contact breaker is shown in Fig. 2. The cam 7 raises the end of the spring H, and causes it to make contact with the platinum-headed screw on the post 6. It will be seen that the shape of the cam 7 is such that a quick break is made, thus preventing undue burning of the platinum on the spring blade and adjustment screw. The device is not a trembler but simply makes and breaks the circuit, the trembler being

Fig. 2.

provided on the coil. Belt transmission is adopted, while a lubricating tank and pump are provided. Two rim brakes are fitted, both operated from the handle-bar.

MR. CATHCART WASON, M.P., has suggested to the Home Office that a corps of policemen on motor-cycles should be established so as to "impose restraint on those who are driving in crowded streets at a furious pace to the danger of the public."

HERE AND THERE.

A NEW list of petrol agents has been issued by Messrs. Carless, Capel and Leonard.

THE Indian Government is said to be prepared to levy an import duty of 5 per cent. on petrol cans.

THE Japan Automobile Co., with a capital of £100,000, has been organised in Tokio to operate a public service of motor vehicles.

Photo by]

The C.G.V. 8-Cylinder Petrol Car.

[Argent Archer.

AN article on emergencies of the road, and how the motorist should meet them, appears in the current "Idler." After all, however, experience is the only satisfactory guide.

MR. D. CITROEN has just issued a handsome coloured show-card. It depicts a depot window, in which is staged a Minerva motor-bicycle undergoing critical examination at the hands of a lady and gentleman. Motor and cycle agents would do well to write for a copy.

FROM the Franklin Manufacturing Company, of Syracuse, N.Y., U.S.A., comes a copy of "Poor Richard's Almanack." This is on the lines of an almanack first published in 1732 by Benjamin Franklin, but for 1903 is made to sing the praises of the Franklin petrol car, the feature of which is the use of a 10-h.p. 4-cylinder air-cooled motor.

A DIRECTORY of the Merchants, Manufacturers and Shippers of the World for 1903 has just been issued by Kelly's Directories, Ltd. It is the seventeenth edition, the first having been published in 1877. In the concluding week of August last the compilers received the corrected lists for 212 different towns and ports, and the numbers for the weeks following were 160, 205, and 106 respectively; in the week ending October 18th the number was 348, and for the two weeks following 169 and 294. Of these numbers about two-thirds of such corrected lists came from agents starting from Central and Southern Europe, Asia, North Africa, Mexico, Central and South America, &c., from their head London office, and other agents working directly under the superintendence of their agents in New York, Hamburg, &c. For correct information as to the remoter towns and ports they have largely to depend on the invaluable assistance rendered by H.M.'s Consuls and Vice Consuls, by Secretaries of Chamber of Commerce, bankers, &c. The book is intended to bring together, in one volume, not only the names of the manufacturers, merchants, exporters, &c., of the United Kingdom trading with the Colonies and abroad, but also those of all the more important foreign merchants (whether exporters to or importers from the United Kingdom), and further, those of the manufacturers of the principal goods imported into the United Kingdom. The publishers thus offer a guide to both the import and the export trades of the world, containing a large amount of information not to be found in any other book. Accuracy has been ensured in a great volume in which the automobile section is now increasing in importance.

THE Edinburgh city authorities are purchasing a steam motor fire engine at a cost of £1,050.

THE Midland Automobile Club is making Hereford its headquarters for the annual Easter Monday tour.

THE first run in connection with the South Wales and Monmouthshire Automobile Club will take place on Easter Monday, the destination being Llantrisant.

THE Ranelagh Motor Company, Limited, has been registered with a capital of £1,500 to carry on the business of manufacturers of motor-cars, etc., at 6, Ranelagh Parade, Barnes.

A GERMAIN car built in 1895 for M. M. Gillard, president of the Liege Automobile Club, has run for over 60,000 miles and is still in daily use between Liege and the Vielle Montagne Zinc Works.

THE Carl Oppermann Electric Carriage Company, Limited, is opening a large motor garage at 6 and 7, Halkin Street, Grosvenor Square, W. It will have accommodation for about 200 cars, with every facility for charging the batteries of electrical vehicles.

THE Woolliscroft Motor Company, Limited, has been registered with a capital of £30,000 to carry on the business of manufacturers of and dealers in motors, motor cars, etc. The first directors are Messrs. W. A. Taylor, W. W. Woolliscroft, and F. C. Colliard, and the registered office of the company is at 177-179, Foleshill Road, Coventry.

ABOUT 100 motor-car mechanics held a meeting in New York recently and took initiative steps towards forming a club for social and professional purposes, a committee being appointed to frame rules. Among the objects will be the regulation of trade abuses, the elimination of dishonest mechanics, and the adoption of a system of grading for members.

A Wartburg Car in the Snow on the Summit of "Ther Fueselberg," near Eisenach, Germany.

THE Wearwell Motor Carriage Company, Limited, have issued a new catalogue of the Wearwell motor-bicycle and motette. In addition to particulars of these machines, the list contains a complete description of the engine and some of its parts. It is fully illustrated with diagrams and engravings, and contains some useful hints on driving, lubrication, and other matters of importance to the motor cyclist.

A MOTOR-LAUNCH is being built for the King at Tagg's Yard, East Molesey.

THE White Steam Car Company is about to open a new depot at 35 and 37, King Street, Regent Street, W.

THE Motor Manufacturing Company, Limited, have just issued a complete handbook to the M.M.C. 8-h.p. cars, which should prove indispensable to users of these popular little vehicles.

CALIFORNIA is to have an automobile endurance run of 100 miles from Oakland around the bay, through San Jose to San Francisco. Each stop for any cause will be penalised, and time-keepers every twenty-five miles will regulate the speed to not over twenty miles an hour.

THE accompanying illustration shows the combination spring hanger, radius rod and swing shackle lately introduced by the Brecht Automobile Company of St. Louis, U.S.A., for whom Messrs. Shippey Bros., Limited, are agents in this country. The motor equipment may be fastened anywhere on the angle iron frame in front of the axle, with chains running from the sprocket

on the axle to the transmission gear of the engine. The chain, which frequently becomes slack and runs off the sprockets, by the movement of the vehicle springs is, it is claimed, always kept in proper tension by means of this device. The combination spring hanger and radius rod permits the use of semi-elliptic springs, which allow the vehicle to be hung low, and insuring easy riding and absolute safety. The radius rods are fastened on both sides of the gear and also act as a brace for the axle. The swing shackle in connection with the rod and hanger enables the spring to move freely and easily.

ON Good Friday the Yorkshire Automobile Club starts for Bowness, the arrangement being that all sections meet at Skipton at the point where the Addingham Road branches off, at 11 a.m., the route taken being via Hellifield, Settle, Kirkby Lonsdale and Kendal. Between Kendal and Bowness the road is rather hilly, but the whole route is in fairly good condition. The headquarters at Bowness will be the Crown Hotel and the Bellsfield Hotel.

AT a meeting of the Roads and Bridges Committee of the Holland County Council, held at Spalding recently, it has been reported that the agreement between the Midland and Great Northern Joint Railway, the Holland County Council, and the Sutton Bridge Urban District Council, as to freeing from tolls the bridge over the river Nene at Sutton Bridge, had been approved.

THE report for 1902 of the Continental Caoutchouc and Guttapercha Company (Hanover) states that the prices of raw indiarubber further declined in the course of the past year. Until the last few weeks of the past year the supplies were effected in a regular manner; but towards the end a rapid upward movement set in on the raw indiarubber market, such as has been seldom witnessed before. Within a short space of time the price for fine Para rose from 3s. to 3s. 9d.; in other words, by 25 per cent., whilst medium qualities for various reasons occasionally rose by 60 per cent. All these increased prices are still prevailing, in consequence of which the leading manufacturers contemplate a corresponding increase of sale prices, all the more as there is in all probability a further rise in store.

MR. A. E. PETTIFER, of Bromyard, has opened a motor garage, with inspection pit, large enough to put up a dozen cars. Petrol, motor grease and oils are kept in stock.

THE collector of Customs in Mauritius says there is an opening there for reliable and not too costly motor-carriages with two and four seats, steam driven, and fired by ordinary oil preferred.

WITH reference to the description of the Pognon sparking plug in a recent issue of the *Journal*, Messrs. Isler and Company write us to the effect that this is an infringement of the patent of M. Crouan, the inventor of the space or gap to prevent corrosion, and that they are taking action in connection with the matter.

THE American Motor-car and Vehicle Company, of Fremantle, Western Australia, have under consideration a projected motor-car service from the coast to one of the gold fields 220 miles inland. The present route by rail is 180 miles longer, with a consequently increased cost of haulage, which is at the rate of 7d. per ton per mile, and the value of goods hauled during the year is £800,000. It is estimated that a motor service for heavy goods could be run at the rate of eight miles per hour at a cost of 2d. per mile, provided ordinary paraffin was the fuel used.

A GENERAL meeting of the Aeronautical Institute and Club was held on Friday, the 20th ult., when Dr. Barton announced that the Institute was organising an exhibition of balloons and aerial machines in July next. M. Aug. E. Gaudron read a paper on "Twenty-four Years of Ballooning." M. Gaudron was apprenticed to an aeronaut in Paris, and on his second ascent he had a thrilling experience. The balloon was not sufficiently inflated by the appointed time, but in order not to disappoint the spectators M. Gaudron detached the car from the balloon, which, thus being freed, slowly ascended, with the youthful aeronaut hanging on the ropes. The gas was escaping from the balloon, and before he ascended far M. Gaudron became unconscious. He was found, still unconscious, on a haystack, some distance from Paris. M. Gaudron's paper was followed by an exhibition of lime-light pictures, some beautiful specimens of balloon photography being thrown on the screen.

HEREWITH we illustrate the new pneumatic wheel for motor-cars which Messrs. R. S. Wood and Company have lately put on the market. As will be seen, the idea is to fit a solid rubber tyre into a metal rim, which in its turn bears upon an inflated rubber tube confined by metal flanges bolted to the sides of the ordinary wood felloe. To prevent the rim and tyre, which come

in contact with the road, creeping and wearing, the inner tube bolts are placed through them at certain intervals, the rim carrying the solid rubber tyre being slotted to allow of the necessary up-and-down movement without permitting creeping. The makers, who are prepared to fit the arrangement to any existing wheels, claim that it gives all the advantages of the pneumatic tyre without the drawbacks of the latter in the way of liability to puncture.

The Motor-Car Exhibition at the Agricultural Hall.

(THIRD NOTICE.)

Photo by]

A View of the Large Hall from the Gallery showing the British Automobile Commercial Syndicate's Stand.

[Argent Archer.

NEXT week we shall complete our report of the eighth annual Motor-Car Exhibition at the Agricultural Hall, London, a task which has become increasingly difficult each year, owing to the greater number of firms in the industry, and the corresponding additions to the exhibitors. The work entailed is obviously heavy; in fact, one newspaper went so far as to excuse some peculiar blunders "by the inevitable stress of show time." The issues of the *Journal* for March and April will present a comprehensive view of the automobile industry at the present time.

PETROL CARS.

The Dechamps cars were once more to be seen at the stand of the GRAPHIC MOTOR AND ENGINEERING COMPANY. The general arrangement closely follows what may be termed Panhard lines, the power being conveyed through a clutch, gear-box, and two side chains, four speeds and a reverse, all controlled by one lever, being available. The engine is fitted with automatic governor acting on the inlet. A special feature of the Dechamps cars is to be seen in the band brakes connected with the rear wheels, the band being put in and taken out of contact with the drum by a double-threaded screw actuated by a hand lever. A complete 18-h.p. car was shown, the body work (by Hamshaw, of Leicester) of which was well worthy of inspection; it takes the form of a roomy Lonsdale wagonette to seat five passengers inside. Side by side with this car was a 14-h.p. double phaeton; access to the rear seats is obtained at the sides, instead of having to lift up one half of the front seat, neat steps being fitted for the purpose. The vehicle has a four-cylinder balanced engine (stroke, 115 mm.; diameter, 95 mm.) water-cooled by means of pump and radiators, and three speeds forward and a reverse actuated by the same lever. We may also briefly mention a 9-h.p. double phaeton with two-cylinder engine (stroke, 130 mm.; diameter, 100 mm.). The novelty on the stand was the chassis of the latest type of Dechamps car—a 20-h.p. with wood and steel frame. The engine has four cylinders, cast in pairs, mechanical inlet valves, on the same side, and operated by the same cam shaft as the exhaust valves, governor acting on inlet, honeycomb radiator, etc. Four speeds forward and a reverse are obtained by means of one lever, the power being transmitted from the countershaft by side chains. An improvement is to be noted in the steering pivots of the front wheels, these being supported top and bottom. The engine can be run at a speed of as low as 200 revolutions per minute. Throughout the new vehicle is on up-to-date lines, and appears to comprise many good points, not the least of which is the efficiency of the brakes.

Messrs. RAWLINGS BROTHERS, LIMITED, the London agents, displayed a chassis and several complete 12-h.p. Belsize cars made by Messrs. Marshall and Company. The main features of these double-cylinder cars have

already been dealt with in these columns, but we may mention that the 1903 models are being fitted with an improved irreversible steering gear and a positive clutch; they are driven through bevel gear on to a live axle, a lid being fitted to the case on the latter to enable the gear to be readily inspected. The pump is so arranged as to be quickly detached when necessary. Other features that we noticed which, while small in themselves, are useful "refinements," are a small bracket on the motor on which to rest the sparking plug for testing purposes, and the hinging of the steering wheel at the upper end of the column, so that it may be tilted up, and so give freer access to the driver's seat. The motor, which develops 16-b.h.p., is of the vertical two-cylinder type, the cylinders being 4 in. diameter by 4½ in. stroke. The cylinder and head are cast in one piece, an extra large water space round the cylinders and the valves being provided. The governor, which acts on the throttle, is enclosed in a dust-proof case practically forming part of the crank chamber. A filter is placed between the pump and water supply. This can be removed for cleaning by undoing a thumb screw, a tap on each side of the pump being provided to cut off the water while this is being done. Three speeds forward and one reverse are provided, controlled by one lever. Both the top and bottom shaft are easily removable, and each gear wheel can be replaced independently of the others. Altogether the car strikes us favourably, particularly on account of the care paid to the little details.

The NEW AUTOMOBILE COMPANY had an interesting array of the latest types of Rochet petrol cars. First we may mention the new 6½-h.p. light car, of which an illustrated description was given in a recent issue. The change-speed gear on these vehicles is exceedingly ingenious, three speeds and a reverse controlled by one lever being available, the power of the engine being transmitted direct on the high gear. Another car on the stand was the 16-h.p. vehicle, which is fitted with a most comfortable body. The power is supplied by a four-cylinder engine, governed on the inlet, and fitted with Grouvelle and Arquembourg "cloissonée" radiator. Four speeds and a reverse motion are provided, the gear-box being connected to the rear road wheels through a differential countershaft and side chains. Probably the most interesting car on the stand was the new 9-h.p. Rochet, fitted with a two-cylinder engine, governed on the inlet, new style radiator, and a change-speed gear giving a direct drive on the third speed, the power being transmitted by a cardan shaft and bevel gear to a live axle. On this stand were also shown an 11-h.p. Limousine and an 11-h.p. Roi des Belges tonneau with two-cylinder motor and the special Rochet change-speed gear described in the *Journal* about two years ago.

The exhibit of the MAIL MOTOR COMPANY comprised a four-seated landaulette fitted with a 12-h.p. two-cylinder vertical motor, with governor acting on the exhaust valves. Except for the engine being located under

the front seat the vehicle is built on the standard lines, the power being transmitted to the rear live axle through a longitudinal shaft and bevel gear, three speeds forward and one reverse being available.

Georges Richard and Mercedes cars again formed the exhibit of Messrs. MANN AND OVEBTON'S, LIMITED, who occupied two large stands. Of the former type of cars examples of the 10-h.p., 12-h.p., and 24-h.p. vehicles were shown. To deal first with the 10-h.p. two-cylinder car; the cylinders are 100 mm. diameter by 100 mm. stroke, the normal speed being

bearings are lubricated by means of rings running in an oil bath. Semi-irreversible steering, with tangent screw of the re-enforced Panhard type, with ball thrust bearing, is employed. The 24-h.p. car is on similar lines throughout, except that the engine comprises four cylinders, and that the wheel base and track are longer, these being respectively 7 ft. 5 in. and 4 ft. 3 in. Altogether the Georges Richard cars have been brought well up to date, and should continue to be a popular type in this country as well as in France. One of the handsome cars of the Show was to be seen

Fig. 43.—Plan of Chassis of Georges Richard 12-h.p. Car.

1,000 revolutions per minute. The cylinders are cast in one piece bolted to an aluminium crank chamber. The governor is of a special circular type, cased in, so as to be entirely dustproof, and acting on a throttle valve on the inlet. The gear box is made of aluminium, bolted on to the under-frame of the car. It is provided with three speeds forward and a reverse, the drive on the top speed being direct. The live axle carries the differential and bevel pinion, to which the drive is taken by means of a cardan shaft from the gear box. The reverse is operated by means of a separate lever, and is so arranged that when the reverse motion is in no forward gear can be put in, and *vice versa*. A foot-operated metal to metal brake acts on a wide drum at the back of the gear box, while a hand lever controls brakes on drums fitted to the rear wheels, all being double acting. The 12-h.p. car (Fig. 43) has a double-cylinder engine, Fig. 44 (104 mm. by 100 mm.), governed on the throttle in a similar manner to the 10-h.p. The Brasier system of magneto ignition is employed, arrangements being provided for

Fig. 44.—The Georges-Richard 12-h.p. Motor—Inlet Side.

the ignition to be retarded or advanced as desired. The water is circulated by a gear-driven pump through the latest type of Loyal radiator. The transmission is by bevel gear on to a live axle, and is the same as in the 10-h.p. car, with the exception that there are four speeds forward instead of three, and a sliding universal joint without bolts. The universal joint between the clutch and the gear box works both ways, thus obviating any wear in the bushes of the engine and gear box. The engine is lubricated by means of an automatic lubricator on the dashboard; the live axle

at this stand, viz., a 20-h.p. Mercedes-Simplex. The details of this well-known type need no description at this time, but we mention that the car exhibited was fitted with a comfortable tonneau body, painted in the usual Cannstatt red colour. Reference may also be made to a large framed sheet of drawings of the new 50-h.p. racer on the construction of which the Hotchkiss Company, the well-known French gun builders, are at present engaged.

Well-finished examples of the 10-h.p. and 16-h.p. Ariel cars, both fitted with tonneau bodies, were shown on the stand of the ARIEL MOTOR COMPANY, LIMITED. The vehicles have undergone considerable improvement for 1903; both the 10-h.p. and the 16-h.p. models are fitted with four forward speeds and a reverse, the wheel base has been increased, and the road wheels are all of equal size. The frame is built up of steel tubing, stiffened by an underframe, to which the engine is bolted. The 10-h.p. motor has two cylinders, 3 $\frac{1}{8}$ in. bore, 4 in. stroke, cast in one piece with combustion chamber and water jacket complete. The crank-shaft is built up with two fly-wheels, which are inside the crank case. The engine is of the high-speed type, developing 10-h.p. at 1,700 revolutions per minute. The 16-h.p. engine has four cylinders, 3 $\frac{1}{8}$ in. diameter, by 4 $\frac{1}{2}$ in.

Fig. 45.—Chassis of Ariel 10-h.p. Car.

stroke. A point worthy of mention is that the exhaust pipes are of flexible, metallic tubing. A small additional air inlet is fitted on the inlet pipe which automatically comes into operation as the admission of gas is throttled by the governor. The latest type of radiator is fitted in front below the frame. The ignition is electrical, and on the 16-h.p. chassis we noticed that the new external jump sparking had been ingeniously fitted. From the engine the power is transmitted to a friction clutch and gear-box, and thence, by means of bevel gear and cardan shaft to the rear live axle. A double-acting, metal-to-metal band brake is fitted to the secondary shaft outside the gear-box, and actuated by foot lever, which, when applied, immediately releases the clutch. Double-acting band brakes are also fitted to each of the rear wheels, actuated by a hand lever. Altogether the exhibit of the Ariel Company was one deserving close attention.

The DELAHAYE CHIEF DEPOT are now introducing the Delahaye cars into this country, and at the Exhibition displayed two well-finished specimens of the 24-h.p. cars, outline elevations and plans of which were reproduced in our issue of the 20th December last in connection with the report of the Paris Salon. Although the latest models have vertical engines, the Delahaye Company have not given up horizontal engines altogether, or they are still fitting them to the larger types of cars, such as omnibuses

this country. The motor is of 5-h.p., the mixture being supplied through an automatic induction valve. The transmission gear is operated by a lever placed to the right of the driver, the drive being conveyed from the countershaft to the live back axle by a chain. Electric ignition is fitted, and there are two speeds forward and one reverse. There are two brakes actuated by foot levers, one being applied by a clutch band to a flange attached to the driving sprocket, and the other being an emergency brake

Fig. 46.—The Delahaye 24-h.p. Car.

and delivery vans. The 12-h.p. motor comprises two separate cylinders and the 24-h.p. four. Each cylinder with its valve chambers are cast in one piece, and the head is formed of a plate which is removable to expose the pistons. The cylinder is water-jacketed down to about two-thirds of its length, and below this the air circulates around the motor, to be warmed before entering the carburettor. The cranks are set at 180 deg., and the engine is further balanced by dividing the weight of the flywheel on each end of the crankshaft. The cylinder diameter is 100 mm. and the stroke 140 mm., the normal speed being 950 revolutions per minute. A noticeable feature of the vehicles is the independence of the motor, change-speed gear box (which gives four forward speeds and one reverse), and differential,

acting directly on the rear axle. The capacity of the petrol tank is five gallons, and the maximum speed is given at 25 miles per hour. Although shown without mudguards, these can be fitted if desired. On this stand the Lipscomb car was also shown, the main features of which have already been familiarised to motorists in our columns.

Two well-finished specimens of the Brown car were shown by Messrs. BROWN BROS., Limited. Except that one has a differential countershaft connected by side chains to the rear wheels, while the drive in the other is by cardan shaft to a live axle, the two cars are identical in construction. The now generally-adopted lines are followed, a two-cylinder motor developing 8-h.p. being located in the front part of the frame, the water circulation

Fig. 47.—The "Brown" 8-h.p. Chain-Driven Car.

each of which may be removed without interfering with the other. The countershaft carrying the differential is solidly bolted to the sides of the frame, and is connected with the rear road wheels by chains. The workmanship throughout is worthy of the old-established Delahaye firm, whose present output at their Paris works is thirty cars per month.

The English Motor Company showed the Oilmobile two-seated vehicle, similar to the car of somewhat kindred name which is already familiar in

is maintained by pump and radiators. Three speeds forward and a reverse are provided, the change speed gear being of the sliding type, controlled by one lever. The road wheels are of equal size, 32 in. diameter in the case of the chain-driven car, and 28 in. in the gear-driven vehicle. The cars complete weigh about 12 cwt., and appear to be of sound construction.

Two attractive stands were occupied by Mr. E. W. HART, one in the Large Hall and one in the Gallery. Among the petrol cars shown were a

9-h.p. Renault, one of the latest types of 10-h.p. two-cylinder Renault cars, and a 20-h.p. Flying Darracq, with a racing body. A 40-h.p. Panhard of the Paris-Berlin type, with a "Roi des Belges" body, attracted much attention, its white enamelled body, with red upholstery, giving it a charming appearance. Several Mercedes cars were staged, including the 16 and 28-h.p. types, both fitted with tonneau bodies. Altogether Mr. Hart's display was thoroughly up-to-date, and well representative of the latest phases of motor-car design.

The BEAUFORT MOTOR COMPANY had a big display of the Beaufort cars, ranging from 8-h.p. to 20-h.p., the latter being well up to date, it being described as the 1904 model. The first car we examined was the new 10-h.p. Beaufort, of which a chassis was shown (Fig. 48). This has a channel steel frame, in the fore part of which is set a two-cylinder vertical engine. The valves are all mechanically operated, the inlet valves being located on one side of the motor and the exhaust on the other. The governor, which is entirely enclosed and runs in oil, is adapted to act on the admission of gas; the throttle valve being controllable from the steering column by a lever, which also acts as an accelerator. With the lever right back the throttle valve is closed; in the central position the engine is working normally, while when the lever is pushed forward the governor is thrown out of action. The ignition is by magneto machine, which is driven by spur wheels instead of a chain, so coupled up that it cannot be set incorrectly. The pump is also gear-driven. A special feature of the carburettor is the provision of a petrol filter which prevents any dust or water passing

Martin de Plazanet and Co., of Paris. This has four separate cylinders, a noticeable feature being the fitting of compression release cocks to the inlet valves. On this stand was also shown a 8-h.p. Gillet-Forest delivery van, intended to carry a load of 15 cwt. This vehicle was illustrated in these columns a few months ago.

Quite a new car to this country is the "Martini," which is being introduced by Mr. MORGAN DONNE. The vehicle, which is of Swiss construction, is provided with a motor developing 17-h.p. at a speed of 1,000 revolutions per minute. The four cylinders are cast in pairs, the dimensions being 100mm. bore by 130mm. stroke. The inlet valves are mechanically operated, and located on the opposite side to the exhaust valves. Magneto ignition is adopted, the sparkers being so arranged that they can be removed very quickly. A honeycomb tank and cooler with fan is used in connection with the water circulation, while the governor is adapted to act on a throttle on the inlet pipe. Four speeds forward and a reverse are provided, the power being transmitted through a friction clutch and gearbox to the differential shaft, and thence by side chains to the rear road wheels. Although the arrangement follows the usual lines, there are a number of novel features about the car. Thus, the clutch spring can be adjusted from the rear, and either half of the differential shaft may be quickly withdrawn and the rear wheels can be instantly detached without in any way interfering with the brakes. The axles and differential shaft run on ball bearings; the pedal brake is water-cooled, while the lubrication is automatically performed. The chassis weighs about 12 cwt.

Fig. 48.—Chassis of Beaufort 10-h.p. Car.

into the spraying chamber. Three speeds and a reverse are provided; the power is transmitted by clutch, gear box and cardan shaft to a live axle, the latter being entirely enclosed and running on ball bearings. The lubrication of all the bearings is controlled from the dashboard. The 14-h.p. Beaufort car is on similar lines to the 10-h.p. vehicle, the engine being larger and the various parts correspondingly strengthened. We now pass to the 20-h.p. car, which has a four-cylinder engine, cast in pairs, mechanical inlet valves, and enclosed governor. Two systems of ignition are provided—magneto and the ordinary high-tension by accumulators and coil. It is claimed that by means of the latter the engine may be started from the driver's seat by simply switching on the current. Four speeds and a reverse are controlled by one lever on the steering column, the change speed gear being so arranged that any desired speed is obtained direct without going through any other speed. The drive on the top speed is direct. This car, which is chain driven, is provided with a special form of tubular radiator. Still another new 1904-model car was to be seen in the two-seated vehicle, with 9-h.p. single-cylinder motor, mechanical inlet valve, two speeds and reverse. The Beaufort cars appear to comprise a number of useful features, the merits of which are being quickly recognised.

The exhibit of the BUCKINGHAM PALACE GARAGE COMPANY comprised a 20-h.p. "Monarque" petrol motor; this has four cylinders cast in pairs, with ordinary suction valves. A governor is provided, acting on the inlet. Another new petrol motor was to be seen in one of 10-h.p. made by Messrs.

Altogether the "Martini" car strikes us most favourably, and it should soon become a popular type in this country.

The principal features of the Gobron motor-cars—the two-cylinder, four-piston, balanced motor and the mechanical carburettor—have already been described in the *Journal*. The GOBRON MOTOR COMPANY, which is now handling these cars in this country, exhibited a 20-h.p. chassis and a complete double phaeton, and a tonneau of the same power. The frame is of tubular construction, and in the latest productions the motor is located under a bonnet at the front. In each of the two cylinders the combustion chamber is located between two pistons which work in opposite directions to each other. The upward pair of pistons are connected to a crosshead linked by side rods to the crank shaft; the lower pistons are connected in the usual way by means of the usual connecting rod. The ordinary form of carburettor is dispensed with, a special injector device being used. The timing of the ignition is controlled from the steering wheel, and is so arranged that the quality of the mixture can simultaneously be regulated. The governor is adapted to act on the mechanical carburettor, temporarily shutting off the petrol supply, should the speed become too great. Four speeds and a reverse are available, the change speed gear being of the sliding type, and the differential shaft connected with the rear wheels by side chains. The Gobron cars are well known for their quiet, vibrationless running, while another noticeable feature is the fact that the carburettor will work equally well with petrol or alcohol or a mixture of both.

A new firm in the trade is the LANCASTER MOTOR GARAGE, who had an imposing display in the Gallery, where was shown one of the most attractive little two-seated vehicles in the Exhibition. This is the "Baby Mass," of which an illustration is given in Fig. 49. In general arrangement it follows the standard lines, being fitted with a $4\frac{1}{2}$ -h.p. Aster motor, water-cooled on the thermo-syphon system. Three speeds forward and a reverse are provided, the power being transmitted by a universal shaft and

Fig. 49.—The "Baby Mass," $4\frac{1}{2}$ -h.p. Voiturette.

bevel gear to the rear live axle. The car is built low, and in view of its price we expect to see a good many in use in the near future. The "Mass" 6-h.p. car, with detachable tonneau, while on standard lines, appears to be of sound construction. The motive power is supplied by a 6-h.p. De Dion engine, with both pump and gravity water circulation. Three speeds forward and a reverse motion are controlled by a single lever, a cardan shaft connecting the gear-box with the live axle. The 12-h.p. "Mass" car has an Aster two-cylinder governed engine, with four speeds ahead and one reverse, direct drive on the top speed, live axle, etc. On the same stand were shown three 10-h.p. Panhard cars of the latest type, one fitted with a luxurious Limousine body, and the other with a Roi des Belges tonneau reflecting much credit on their builders, Messrs. Lamplough, of Paris.

The RIDLEY AUTOCAR COMPANY, LIMITED, are devoting their attention to the production of popular-priced cars, their exhibit being confined to a $3\frac{1}{2}$ -h.p. voiturette and one with $4\frac{1}{2}$ -h.p. engine (Fig. 50.) The feature of these vehicles is found in the transmission, for the details of which we refer readers to the drawings given in our issue of January 11th, 1902. The frame is of tubular construction, in the fore part of which is a single-cylinder

Fig. 50. The Ridley Voiturette.

motor, with water circulation on the thermo-syphon system, no pump being used. Two speeds are provided, the power of the engine being conveyed through a universally-jointed longitudinal shaft and skew bevel gearing to the rear axle. The change-speed gear is combined with the bevel gear drive. There is no balance or differential gear in the ordinary sense of the word, the rear road wheels being fitted to the single piece axle by free-wheel clutches, so that the outer wheel can overrun when turning corners. The longitudinal shaft does not terminate at the bevel pinion,

but is extended, and passes over the main axle, thus avoiding the necessity for cutting either of them. As the pinions and wheels are in different planes, the teeth of the latter have to be cut on the skew to gear properly. The pinions are always in mesh with their respective wheels, but are only fixed to the shaft one at a time by means of a sliding clutch, the parts of which are coupled so that the engagement of one pinion is preceded by the disengagement of the other. The whole arrangement is enclosed in an oil-tight casing, provided with ball bearings for the shaft and axle. It will be seen that the gear not only acts to transmit the power to the rear axle, but as a change-speed gear, without taking up any more space in the gear box. The car is provided with compensating brakes on drums the rear hubs, tyre brakes being also fitted for emergency purposes.

Every time we visited the stand of the MOTOR CAR COMPANY, LIMITED, we found it the centre of a circle of interested visitors, the object of their attention being the chassis of the latest type of 16-h.p. Decauville car, and it must be said at once that half an hour spent on the details of this vehicle could not prove other than instructive. As will be seen from Fig. 51, it possesses the feature of a steel shield preventing mud and dust approaching anywhere near the vital parts of the mechanism. Use has been made of this shield in supporting the motor and gear box from the frame of pressed sheet steel. The engine is four-cylindrical, each pair of cylinders having its own crank case. The water jackets are divided verti-

Fig. 51.—Chassis of Decauville 16-h.p. Car.

cally, so that it is impossible for the water to escape without first travelling entirely round the cylinders. The fly-wheel is supported both upon the engine and the gear-case sides, thus relieving the former of too heavy a strain. The engine is governed on the admission, and this is supplemented by a throttle, controlled from the steering post, by which the speed of the engine can be still further reduced. An accelerator pedal is also provided; the normal speed is 900 revolutions per minute. The inlet valves are mechanically operated, and located on the opposite side of the engine to the exhaust valves. With regard to the ignition, this is on the accumulator and coil system; the main wires to the commutator are very short, terminating in electrodes attached to a fixed insulating plate, over which the electrodes have sufficient movement for timing purposes without the wires being moved. A dynamo is attached to the dashboard and is driven by a band from the engine shaft. By this means, whilst the car is running, the batteries are constantly being charged. The spring of the friction clutch, which is of the internal variety, is fixed on an extended boss of the fly-wheel, the opposite end of the spring engaging with a tail from a ball race. The engaging portion of the clutch, forming part of the fly-wheel, is detachable in two halves. The change-speed gear is of the sliding pinion type, giving three forward speeds and a reverse, all operated by one lever. The drive to the rear axle is by means of bevel gear and a shaft with universal joints. The latter are of a special

enclosed type, running in oil. A large inspection cover is fitted to the gear box, an arrangement which greatly facilitates any necessary examination of the gearing. The rear axle is of such design that all the weight supported by the rear springs comes on the axle sleeves and none on the shafts which transmit the power from the differential gear to the road wheels. These shafts fasten into the side gears of the differential by means

joint being perpetually immersed in grease. The carriage itself is most comfortably suspended, a transverse spring in connection with the two elliptics being used. The tonneau is very roomy, whilst seats of the bucket type are employed for the front.

Among the new cars which made their appearance at the Show were the "Hurst," of which both a 12-h.p. and a 24-h.p. were shown. They are

Fig. 52.—The "Hurst," 24-h.p. Car.

of squared end portions and to the hubs of the wheels by means of a claw clutch at the outer end of the hubs. When the caps are taken off from the hubs the shafts may be withdrawn by means of any small tool, such as a screwdriver. The car is well equipped in the matter of brakes. The hand-applied brake tightens bands upon steel drums fixed to the rear wheel hubs, and that operated by the driver's foot expands a series of bronze blocks acting upon the inside of the same drums. All bearings are mechanically oiled by dynamo ring lubricators. The method by which the engine is secured to the frame is novel. The whole block constituted by the motor and gear is securely bolted to a sheet of steel, referred to

the production of Mr. G. HURST, and were well worthy of close inspection. The following description, which relates to the 24-h.p. car, may be taken, however, as applying to both, the 12-h.p. vehicle (except that it has only a two-cylinder engine) being constructed on similar lines. The main frame is constructed of wood and steel, the engine and gear being supported on an underframe of angle steel. The 24-h.p. engine comprises four cylinders, $4\frac{1}{2}$ in. diameter by 5 in. stroke, the speed ranging from, it is claimed, as low as 100 up to 1,000 revolutions per minute. The inlet and exhaust valves are extremely accessible and may be inspected by the removal of two nuts. The governor which acts on the inlet is of the usual centrifugal

Fig. 53.—The M.M.C. 20-h.p. Car with Canopy. (See page 121.)

above, this in turn being firmly attached to the framework of the vehicle. On the same stand was shown a 20-h.p. and a 10-h.p. Decauville car. The 20-h.p. vehicle is provided with two engines of the 10-h.p. type coupled together on a common crank chamber. A fortified back axle, similar to that in the 16-h.p. car, is used. Automatic lubrication is provided throughout, the cardan joint being protected by a special cover which insures the

type, and can be thrown out of action by a small lever on the steering column. The water-cooler is of the multitubular type, with fan. The change-gear is enclosed in an oil-tight case, and contains the usual double train of wheels and a positive clutch giving a direct drive on the top speed. The change-speed gear is controlled by a lever situated on the right hand side of the driver, and gives a range of three speeds forward and a reverse

From the gear box the power is transmitted by a longitudinal cardan shaft and bevel gearing to the rear live axle. A double-acting, foot-controlled, metal to metal brake is provided on the bevel pinion shaft, while a hand lever controls band brakes acting on large drums fastened to the hubs of the rear road wheels. The vehicles have a striking appearance, and, judging from a brief inspection, the various details appear to have been carefully worked out.

A big display of M.M.C. cars was made by the MOTOR MANUFACTURING COMPANY, LIMITED, ranging from the popular 8-h.p. voiturette to a powerful 20-h.p. car. The former has three speeds forward and reverse, and has

Fig. 54.—Chassis of Chenard-Walcker 14-h.p. Car.

recently been improved as regards the steering, which is now of the irreversible type. The gear is very easily changed, the pairs of gears being always in mesh. The M.M.C. 10-h.p. two-cylinder car is now fitted with a new closed end motor, a patent governing device acting on the induction pipe. In connection with the latter it may be mentioned that when the throttle valve is closed, shutting off the supply of mixture, an auxiliary air-valve is opened, thus allowing cold air to be drawn in to assist in keeping the valve chambers and cylinder cool. The vehicle has three forward speeds, the gears being always in mesh, controlled by one lever. The design and finish of the carriage body and upholstery is well up to the M.M.C. standard. The largest car on the stand was a 20-h.p. vehicle (Fig. 53), with the latest type of closed-end motor, governed on the induction. It has a foot accelerator, which cuts the governor right out; three speeds and reverse; water-cooled brake; and mechanically-operated lubricator for the engine. The *piece de resistance* on the stand was the chassis of the latest type of 20-h.p. M.M.C., which is a fine piece of work. The engine has four separate cylinders, the inlet and exhaust valves of each being held in position by an arched piece and a single nut. A honeycomb radiator has been adopted, the holes in this being corrugated, thus increasing the cooling surface. Another new departure is the adoption of the Eisemann system of high tension magneto ignition. In other respects the details are the same as in the 20-h.p. car referred to above.

The WESTON MOTOR SYNDICATE again made the Chenard-Walcker cars a prominent feature of their stand, examples of the 10-h.p. and 14-h.p. types being displayed, the former having the Panhard type of gear and chain transmission, and the latter the Chenard-Walcker patent driving gear. In both cases the motors have mechanically-operated inlet valves, located on the opposite side to the exhaust valves, with a special form of governing device acting directly on the inlet valves by means of specially-formed cams. The valves are always given a full lift, but the time they are kept open to the full is varied by the automatic governor or by a hand "accelerator," the control being further aided by means of a "moderator" pedal which is now being fitted. The cam shaft carries a sleeve with suitably formed cams thereon; these lifting the induction valves in the same manner as the exhaust valves are lifted, with the difference that the cams are made with a lifting surface varying from a line to the maximum in width. As the cam sleeve is moved laterally on its solid shaft by the governor in exact relation to the speed of the engine, the induction valves, while always being opened to the full extent of their lift, are by the variable width of the lifting surface held open for the inlet of gas a longer or shorter time, in proportion to the required speed of the engine. The variation of the feed, and consequently the speed and power, of the engine, thus depend entirely upon the length of time the valves are left fully open, and not upon their being opened more or less. By this means a great elasticity of power resembling that of steam is obtained, and permits the engine to be run at speeds ranging from 50 to 1,200 revolutions per minute. The ignition also deserves special notice, since it is

obtained by a single contact for both cylinders. A spark is formed in both cylinders simultaneously, one firing a charge, the other being a useless one except in so far as it dispenses with tremblers, a double coil, and facilitates the synchronising of the sparking. The inlet and exhaust valves (which are interchangeable) are easy of access, and can be taken out by removing a single nut. The 10-h.p. engine has cylinders $3\frac{1}{2}$ in. diameter by $5\frac{1}{4}$ in., the dimensions in the case of the 14-h.p. motor being 4 in. by $5\frac{1}{4}$ in. Both cars are fitted with a novel combination friction clutch and brake (Fig. 56); the lever in connection with the right-hand pedal, when fully depressed, not only withdrawing the clutch, but putting on a powerful brake. The clutch is of the cone variety, and owing to the lateral thrust of the spring being balanced, no special device for compensating end thrust is necessary. The tension of this spring is adjusted by means of a single nut. Referring to Fig. 56, it will be seen that the female portion of the clutch C is mounted on and rotated by segmental studs B on the flywheel A, and is made with a boss C' running loosely on the clutchshaft E. Upon the pedal G being depressed, the male portion of the clutch D is withdrawn from contact with C against the compression of the spring surrounding the shaft E. This disengages the engine from the driving gear. A further depression of the pedal G causes the rearward coned portion of the male clutch D to be brought into contact with the coned braking ring D', which is rigidly affixed to the frame. A separate pedal is fitted by which the clutch is merely disengaged and engaged without applying the brake. The segmental studs B on the flywheel are only intended to engage the corresponding recesses in the hollow cone C in order to rotate the latter. As already mentioned, the 10-h.p. car is fitted with three speeds and reverse, with chain transmission. The change gear and differential gear box is suspended from the

frame by three pivoted hangers, which preclude any torsion of the frame due to inequalities of the road surface. The 14-h.p. car has four forward speeds and a reverse, with a direct transmission on novel lines (Fig. 55). The propeller shaft is fitted with universal joint at either end, the rear universal joint having also a sliding action to allow for deflection. It will be seen that there are two distinct axles, the lower of which is fixed and carries the weight of the chassis, whilst the upper, placed directly above it, is the driving shaft, rotated by bevel gearing and propeller shaft. The driving wheels rotate on the lower axle, and are fitted with heavy gunmetal rings with internally-cut spur gears, driven by pinions on the driving ends of the shaft. The principal claim made for this construction is that it eliminates the disadvantages of live axles divided in the centre (by the differential) where the strains are most accentuated. There can be no question that a good deal of careful thought has been expended on the design of these cars, not only to render them silent in operation, but also economical in running. The very low fuel consumption in the trials in France last year was received with much incredulity, but all doubt has been removed by the repetition of the performance in the *Concours de Consommation*, held a month or so ago.

Fig. 55.—The Rear Axles and Driving Gear of the Chenard-Walcker 14-h.p. Car.

The Salsbury light car was shown by Mr. H. P. SALSBUURY. This is fitted with a 6-h.p. De Dion or Aster engine, as desired, the gearing being of the Panhard type with three speeds and reverse. The frame is strongly built of channel steel and the engine suspended direct by means of bolts. There is seating accommodation for three passengers, a bucket seat being provided at the rear. If desired, a tonneau body can be fitted. With its long wheel base the car attracted attention among the many vehicles shown for men of moderate means.

An attractive two-seated car was shown by the CLARENDON MOTOR-CAR AND BICYCLE COMPANY. This is on the lines of the one illustrated in our issue of August 30th last. It is driven by a 7-h.p. single-cylinder water-cooled engine driving through clutch, and a gear box giving three forward speeds and a reverse, and thence by car shaft and bevel gear to the live axle. An interesting exhibit on this stand was a 65-h.p. engine (Rowbotham's patent). It is claimed that the motor is free from vibration, and requires no water tank or jacket. The principle upon which it works is somewhat similar to that of the Diesel engine, inasmuch as it uses heavy oils instead of the lighter spirits. Air enters the working cylinders under compression, which is further in-

creased by the usual compression stroke of the engine. The fuel is injected into the cylinder during the time the secondary compression is going on, and is ignited in the usual way. Instead, however, of an explosion, the fuel contained in the cylinder is simply ignited, an expansion of the gases taking place rather than an explosion. Without drawings it is somewhat difficult to clearly describe the engine, which is the result of experiments extending over several years.

The leading exhibit of Mr. FRANK MORRIS was the chassis of the 10-h.p. Sandringham car. While this follows, generally speaking, the lines adopted in the Panhard vehicles, Mr. Morris has endeavoured to produce not an excessively speedy car but one which shall be reliable. The main frame is of light U section channel steel, an under-frame carrying the engine and gear box. The vertical motor comprises two cylinders, developing 10-h.p. at 800 revolutions per minute; the engine is governed on the exhaust by a specially-designed sliding cam gear. Instead of the usual fixed cams on the cam shaft, loose longitudinal sliding eccentric cams are used, which, when actuated by the governor, control the motor by varying the lift of the exhaust valves. The ignition is electrical, a feature being the use of a special commutator on the dashboard, with bevel glass front and carbon contacts, driven by bevel geared universal shaft from the cam shaft. Tube ignition is provided as a reserve. The water circulation is maintained by a slow-running, gear-driven pump and a special radiator, placed in front of the motor, directly above the water tank, and containing 70 ft. of radiating tubes cooled by a fan. The clutch is of the cone type with ball thrust; the male portion slides upon the first-motion shaft and drives it by three feather keys. The second motion shaft is arranged above the first motion shaft in the gear-box. Four speeds are provided, the gear-box being fitted with Morris's sleeve, with interchangeable third and fourth detachable speeds by means of which they may be easily replaced at any time. The differential shaft is fitted with adjustable hardened ball thrust for forward and reverse gear. The gear-box bearings have extra large dustproof brasses, with chain ring lubrication. Double-acting expanding brakes acting on drums are fitted to the sprocket pinions, both actuated by a pedal. A hand lever actuates two brakes of the same type on drums connected with the hubs of the rear wheels. The rear portion of the body is hinged at the back so that it can be tilted up in order to get at the gearing. The vehicle is supported on substantial springs enabling solid rubber tyres to be used. The dashboard is of the curved gun carriage type, with side cupboards. Mr. Morris also showed the body of a nine-seated 10-h.p. motor-bus for hot

work, and specimens of the Sandringham cylinders and pistons, by means of which users of old 6-h.p. Daimler type cars can convert their engines into 10-h.p., and users of old 12-h.p. Daimler type motors into 20-h.p.

ELECTRICAL CARS.

Much interest was shown in the chassis of a new electrical car exhibited by Mr. E. W. HART. A noticeable feature of this is the frame, which is so constructed that any type of carriage-body can be fitted to it. It is built of wood and steel, and, instead of being rectangular in plan, the front cross bar is of a (-shape). A new departure is also noticeable in the suspension of the frame; it is supported at the rear by the usual plate springs parallel with the long members of the frame, while at the front it is carried on a transverse plate spring. A 4-8-h.p. electric motor is directly connected by spur-gearing to the rear live axle. The controller is adapted to give five speeds forward, one reverse motion, and an electrical braking position. The battery, which consists of a set of forty-four accumulators of the Phoenix or Fulmen type, of a capacity sufficient to run the vehicle a distance of from forty to fifty miles on one charge, is carried in a large tray slung underneath the centre of the frame. A novel system of support is adopted, by means of which it can be quickly lowered on to a trolley when discharged, to be replaced by a charged battery, or let on to the ground to enable a connection to be re-made, should one happen to work loose. Mounted on the frame are two transverse rods, free to rotate; to each end of these a short length of chain is attached, while on one end of each is fixed a worm wheel with which mesh worms formed on a shaft, which can be rotated from the rear of the car. On the battery tray are fitted four rings with which hooks on the ends of the chains engage. Thus the battery can be raised or lowered as desired, the chains winding themselves on the rods when the battery is raised into position. Two pedals are provided, one controlling the circuit breaker and the other a powerful hand-brake. On the same stand were shown well-finished specimens of three different types of bodies—Victoria, landaulette, and brougham, which may be fitted to the chassis of the Hart electrical car.

A type of electrical vehicle new to this country was to be seen in the Waverley shown by the WAVERLEY ELECTRICAL VEHICLE COMPANY. The display comprised five different types, ranging from a neat two-seated runabout to a tradesman's delivery van. A noticeable feature is the attention which has been paid to the question of securing great elasticity of the body suspension, no frame in the usual sense of the word being employed. The two-seated runabout, the two-seated Chelsea, and the Stanhope are fitted with one 3-h.p. electric motor, while the four-seated Surrey and the delivery van have two motors of the same power. They are of the ironclad or enclosed multipolar type, with drum armature and machine-formed armature coils; they are capable, like all electric motors, of developing much beyond the normal rate for short periods. The motors are so mounted forward of the rear axle that they are free to oscillate independently of the carriage body. In the cars with one motor a brake drum is mounted on the projecting end of the motor-spindle. The power is transmitted by a double helical or fishbone toothed pinion to a similar wheel surrounding the differential gear on the rear axle. The large gear wheel is made of gun metal, and the small pinion of solid steel, and both parts run in an oil-containing case. The double helical gear is claimed to entirely obviate all noise, and at the same time insure great durability of the parts. In the cars with two motors, they are mounted one on each side of the gear case, each driving one of the rear wheels of the vehicle through double helical gearing independently of the other, no differential gear being used. The

Fig. 57.—Rear Axle of Waverley Electric Car, showing Double Motor Drive.

cars with single motor are equipped with a battery of twenty-four accumulators of the Planté type, and those with two motors with forty accumulators, the capacity being stated to be sufficient for a run of about forty miles on one charge. The controller is adapted to give three speeds forward and reverse, and an electrical braking position, by means of which the motor is converted into a generator, thereby producing sufficient current, which is thrown automatically through resistance, for retarding the speed of the vehicle. In addition a pedal-operated hand brake is provided. The vehicles are equipped with tiller steering and wood wheels, while the bodies are luxuriously upholstered.

STEAM CARS.

General adoption of heavy steam vehicles has caused traction-engine builders to devote attention to the question of producing an engine to come within the tare-weight limits of the Act for hauling heavy loads. At the Show two engines of this kind were exhibited, one of which was dealt with in a recent issue. The other is illustrated in Fig. 58; it is the production of Messrs. WALLIS AND STEVENS, Limited, the engine they had on view being coupled up to a trailer loaded with 6½ tons of parsnips. It will undoubtedly take some time before the full value of these light locomotives is generally appreciated, but all those who have materials to remove or deliver should carefully take the matter into consideration, as, in every case where there is much work to be done, the saving effected by using steam over horses or other forms of power is very great. The engine is designed for the purpose of doing the work now done by one, two, or four heavy draft horses. For this work Messrs. Wallis and Stevens claim that it is far preferable for the motor to be independent of the vehicle it is to draw; it is easier to handle, enables a larger load to be taken, and divides the weight over eight instead of four wheels. One of its important features is that it can work with existing vans, wagons, trolleys, or any other form of vehicle suited to the special requirements of the materials to be conveyed, and also that it can be shifted from one vehicle to another without loss of time. With regard to the details, it may be mentioned that the boiler is of the loco-multitubular pattern. The engine cylinder is steam-jacketed and lagged, while the transmission is by spur-gearing, two speeds being provided. The wheels are of a stout section of T steel, with wrought spokes strongly rivetted. The hind axle is fitted with a patent spring arrangement, the forecarriage being also provided with a spring. The change speed gear is provided with a locking arrangement, which prevents the possibility of accident by the two speeds coming in contact at the same time. A very powerful brake is provided, which is applied to

bored cast-iron cylinder. The timing of the ignition, the lifting of the exhaust valve and the cut-off of the current are all operated by one lever on the handlebar. The machine is fitted with an internal expanding compensated drum brake on the rear wheel hub, and a pull-up tyre brake on the front forks, which are reinforced by two stays extending from the front wheel spindle to the ball head clip. The motor is carried vertically in front of the bracket in a bifurcated bottom tube through which the engine-cylinder passes. A novel petrol level indicator is provided, this showing the depth of petrol in the tank in inches.

On the stand of Messrs. VAN TOLL and Co. was shown a new motor-bicycle of Dutch construction, known as the "Altena." The machine is noticeable on account of its X frame, the 2½-h.p. motor being fixed vertically just in front of the bottom bracket.

Included in Messrs. BROWN BROS. exhibit was the Brown motor-bicycle. The frame is specially designed to allow of the engine being attached vertically and not built in. The motor is 2-h.p., the cylinder being 64 mm. diameter by 70 mm. stroke. It can be easily detached from the frame by removing two bolts. Special attention has been paid to the construction of the base chamber, which is oil-tight. The belt pulley is also oil-retaining, thus keeping the belt free from oil. An efficient silencer and the Longuemare carburettor are provided. The contact breaker is of the "make and break" type. An exhaust valve lifter is fitted, while the belt is of the twisted raw-hide pattern with core, or a V-shaped pattern can be fitted if desired. The weight of the machine complete, fitted with spirit and lubricating oil ready for running, is about 110 lbs. A machine built of B.S.A. fittings and provided with Minerva 2-h.p. motor, having mechanically-operated inlet valves, was also shown. On a separate stand a big display was made of motor accessories, which included almost everything a motorist may desire, from a motor to a screw.

Fig. 58.—Messrs. Wallis and Stevens's Miniature Traction Engine.

the rims of both the driving wheels, thus being able to stop or hold the engine in any position, while, in case bad roads or very steep gradients be met with, a winding drum is fitted to the engine, by means of which, though remaining stationary itself, the engine can haul up the loaded trailer.

A new steam-car named the "Hythe" was shown in an incomplete condition on the stand of Messrs. SUFFIELD AND BROWN. Outwardly it resembles somewhat the standard type of petrol car, a 20 in. tubular boiler with 689 tubes being located under the bonnet. The burner is one of Clarkson's, ordinary paraffin being used as fuel. The car is driven by a 15-h.p. engine having three cylinders—one high and two low pressure. A Renold silent chain connects the engine with the differential shaft, from which the power is conveyed by side chains to the rear road wheels.

The merits of the Hydroleum system applicable to steam cars were demonstrated by the HYDROLEUM MOTOR COMPANY, Limited. By the use of the company's feeder, together with the fittings, Hydroleum oil can be used for fuel in any make of steam car at a cost of less than one farthing per mile per ton. Ordinary paraffin, too, can be employed with satisfactory results. Some comparative tests recently carried out by Mr. Worby Beaumont in connection with a Locomobile showed that on a distance of fifty miles there was a considerable balance of economy resultant from the application of the Hydroleum system, which evidently satisfied Mr. Beaumont as to its efficiency.

GENERAL.

Among the motor-bicycles which attracted attention was the "WELER." This is made with engines of 1½-h.p. and 2-h.p. The motor has a mechanically operated inlet valve and an exhaust valve lifter. Two ignition batteries are provided, either of which can be put in circuit by means of a compound plug. The engine is built exceedingly light, the radiating flanges being constructed of stamped steel pressed on to a straight

A variety of miscellaneous parts for motor-cars was shown on the stand of Messrs. SUFFIELD AND BROWN, including electrically-welded channel steel frames, boilers, expanding copper joints, roller bearings, the Fleuss boiler feed regulator referred to in our report of the Stanley Motor Show; Joel's patent controller for electrical vehicles, the feature of which is its quick action, and a Joel "Sine" electric motor. The latter runs at 900 revolutions per minute, and gives 63 amperes at 80 volts: it is of the double-wound type, and has a high efficiency.

The Clement-Garrard motor-cycles were shown in the gallery by the GARRARD MANUFACTURING COMPANY, Limited. Their merits are generally well known, and secured general attention at the Exhibition.

At the stand of the BIRMINGHAM MOTOR MART Mr. R. J. Alpe made a great feature of his "Westland Brush" sparking plug. The terminal of the inner core consists of a bundle of wires somewhat on the lines of the old briar broom. The stem of the core is made from hard-drawn copper wire, in the head of which the pure platinum points are inserted and permanently fixed. This core is firmly cemented in the porcelain, which itself is fastened and cemented in the nut of the plug, and it is quite free in the body. There is, therefore, no strain whatever upon the porcelain, hence there is no tendency or liability to crack or burst with contraction or expansion from the heating or cooling of the engine. The end of the porcelain is formed into a ball, and will not crack or chip with the heat of the explosion. This formation effectually prevents short-circuiting. The porcelain is moulded perfectly true, and is made from a specially-selected and tough material. It will be found sufficient if the nut is screwed up lightly with the fingers to screw the terminal of the high tension wire on to the brush plug. The brush consisting, as it does, of sixteen wires, each giving an independent spark, an aggregate spark of great strength is obtained.

Messrs. F. A. PULLEN AND Co. made a display of the Moore steam pumps, which have become well-known among automobilists since they were first described in our pages. Several other specialities were also exhibited,

and their stand was of considerable interest to users of steam-cars. "Smooth-on castings" were on view, this being an iron cement for repairing blemishes, blowholes, or defects in iron or steel castings.

Messrs. BRANSON, KENT, AND CO. had a very comprehensive collection of accessories for automobilists, and showed several good lines in lamps, carburettors, horns, pumps, coils, plugs, voltmeters, tools, valves, and spare parts, switches, jacks, tool bags, etc. Their non-slipping pulley and a spark gap device were objects of much interest to visitors.

The display of Messrs. ARMSTRONG, STEVENS, AND SON was of substantial interest, and although their specialties do not lend themselves

Fig. 59.—The Armstrong-Stevens Tubular Radiator.

to artistic display, they attracted considerable notice. The new tubular water radiator (Fig. 59) is made up with solid-drawn copper tubes. The latter are flanged very effectively, and the whole design is worthy of close study by manufacturers. A spring catch fastener is employed in place of the familiar knob, with the result that vibration has no effect, and the rattle often associated with the fasteners is obviated. A good assortment of drop-forged goods was also shown.

The "Empire" storage batteries for the electric ignition of automobiles were shown by Messrs. SUTHERLAND AND MARCUSON, whose battery accessories are favourably known to motorists generally.

A miscellaneous collection of pumps, lubricators, electrical terminals, unions, stampings, etc., for automobiles was shown by Messrs. ROSS, COURTNEY AND CO., LIMITED, who also exhibited horns, pumps for motor-tyres, etc.

Among the novelties at the Show was CUTMORE'S PATENT "CARSIQ," a new method for giving the signal in connection with motor-horns. A rubber bottle-shaped bulb is encased in a spherical metal ball, in two halves, and connected together in the centre by a screw-threaded joint, the upper portion of which is provided with a metal plunger, which moves in a collar in a central vertical position, so that when influenced by pressure on the hand or other means the bulb is collapsed and the signal given instantaneously.

The Max electric accumulator was shown by Messrs. J. HOLDER AND CO., it being claimed for this speciality the triple advantages of robustness, lightness and cleanliness.

Messrs. Philipp and Co. were represented by a comprehensive display of speed gears, motor axles, motors, artillery wheels, radiators, lubricators,

Fig. 60.—Messrs. Philipp's Combined Water Tank and Radiator.

etc. Among the special articles was a ball fork swivel front axle, while considerable space was devoted to Sauerbier's radiators, in which endless spiral fins are fitted to form one body only when connected to the tubes. Among the new radiators for which Messrs. Philipp and Co. anticipate a wide market is that illustrated in Fig. 60. The new model of the Camper engine of 14-h.p. attracted much attention, as well as a new irreversible steering gear which, instead of being actuated on the usual principle of the quadrant and worm wheel, is controlled by means of two cams acting on two rollers attached to an arm on the lever connecting to the steering links.

A striking display of motor garments, both for ladies and gentlemen, was made by Mr. C. R. Base, whose tailoring taste is embodied in all his productions. The "C.R.B." specially-milled melton or frieze motor coats are among his specialties; the advantage of the style being that it gives good protection to the chest, and forms a wrap for the knees, as it is cut very full in the skirt, and buttons to the bottom inside. A motoring zibeline coat for ladies was also noticeable for the protection it gives to the shoulders in wet and cold weather, being waterproof and windproof as well as comfortable in wear and appearance. Divided aprons, leather jackets, overcoats, vests, trousers, etc., for gentlemen motorists, as well as mechanics, also had a place on the stand, on which was a good collection of garments in furs, ponyskins, etc. A comprehensive selection of gauntlets, goggles, motor veils, foot muffs, etc., completed a very interesting display.

Mr. O. C. SELBACH had a large display, showing radiators, gearing, axles, and other parts, the well-known Dubrulle lubricators, Viteesse lubricating oils, "Spitfire" sparking plugs, spark intensifiers, high speed coils, Pozzy and Potron's axles, etc. Examples of the Regal car were also on the stand, fitted with engines of 6-h.p. and 12-h.p. respectively. That of lower power has three speeds forward and reverse, the other having four speeds in addition to the reverse motion. All speeds are actuated by one lever, and there is a direct drive through on top speed, all intermediate gears being at rest.

On their stand the E. M. BOWDEN'S PATENTS SYNDICATE, LIMITED, illustrated the adaptability of the Bowden mechanism for controlling throttle, valve lifter, carburettor, and advance sparking. The Bowden patent clutch-hub and chain drive for motor-cycles was another important speciality on this stand.

The CLIPPER PNEUMATIC TYRE COMPANY, Limited, had a good show of the Clipper Continental tyres, which have rendered a good account of themselves since their introduction to the motoring world. Prominent on the stand was the new "non-slipping Clipper Continental motor tyre," which we described in a recent issue, and an illustration of which appears in Fig. 61. This is being made by the Continental Caoutchouc and Gutta Percha Company, and at their works in Hanover and on the German highways it has been submitted to a series of tests which have demonstrated its property of reduc-

Fig. 61.—The Clipper-Continental Non-Slipping Tyre.

ing sideslip to a minimum; in fact, it is claimed to obviate it altogether, a point upon which the experience of English users will shortly be available. The tyre is fitted with a flat tread extending all round the tyre. In the centre of the tread are embedded corrugated metal discs, 1 in. diameter and about 1½ in. apart, which discs are entirely vulcanised into the rubber, and lay flush with the tread itself. They can be replaced, when the corrugations are worn down, by new ones, which are screwed into the tread in an easy and secure way. The corrugated surface of the discs performs the usual service of considerably reducing the chances of side-slip.

The FISK DETACHABLE Vehicle Tyre was shown by the SOUTH BRITISH TRADING COMPANY, who also had on view the "20th Century" motor-head and side lights, the "Sterling" motor-tool kits, and other accessories familiarly known. The method of attaching depends in no way upon the air pressure in the tyre to hold it on the rim, and it cannot blow off from or creep on the rim until the clamping bolts have been removed. The tyre is attached to a perfectly flat rim, and its design is such that the base or the beads are held in such a position that the inner tube cannot be pinched, and there is no chance of any mistake being made in attaching or of the inner tube blowing out when the rings and bolts are once in place. These rings which hold the tyres in place have an inside angle surface, and the beads play the part of an inside coned wedge, serving two purposes: first, of clamping the beads together, and, second, of locking the base of the tyre firmly to the rim, thereby preventing all danger of creeping. Perhaps secondary to the ease of riding is the ease with which the Fisk tyre can be removed from and replaced on the rim, and in view of the fact that all parts are visible during the operation, there is no liability of failure. The method of manufacture is such that the outer case when off the rim assumes the same position as when attached, which enables the operator to insert the inner tube without fear of its being misplaced, pinched or wrinkled, while the tyre is being attached.

Mr. A. BAEDER showed the Helios lamp, described in the *Journal* a few weeks ago, and also some specialties in motor-car horns.

(To be concluded.)

CORRESPONDENCE.

ASSISTING THE POLICE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We should like to know if any of your readers can answer these questions:—(1) If a person is told by the police to stand in the road in the way of a car, who would be answerable for injuries? Would that person be obliged to obey, or be fined if he did not? (2) What punishment can be inflicted on any person warning the drivers of cars of a police trap? (3) Who would have to defray the cost of putting posts every quarter of a mile along the road so that drivers could check their speed? The answers to these questions will be interesting to a great many people, especially in Crawley, as this district is an affected area.—Yours faithfully,

W. W. BANNISTER AND CO.

HORSE-POWER OF MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your second notice of the recent Motor-car Exhibition at the Agricultural Hall I observe some particulars of various cars, and with great pleasure notice that you have inserted in many cases, in addition to the horse-power named by the makers, the actual bore and stroke of the cylinder and piston. One of the cars referred to is classed as a 10-h.p., having two cylinders, $4\frac{1}{2}$ -in. bore by $4\frac{1}{2}$ -in. stroke, with 800 revolutions per minute as a normal speed. I happened to be one of the visitors to the Show, and was much interested there in the design and engine of a nominal 10-h.p. car with three horizontal cylinders, $4\frac{1}{2}$ -in. diameter by $4\frac{1}{2}$ -in. stroke. The latter engine was rated at 10-h.p., with 750 revolutions per minute as normal speed, and my object in writing to you is to ascertain why the car you have described on page 92 of your last issue is classed as 10 h.p., and the other the same, when to all appearances, and with a very simple calculation, if one shows 10-h.p., the other ought to show at least 15, even with the fifty slower revolutions per minute. While at the Show I was pointed out a car with $6\frac{1}{2}$ -h.p. engine, the bore and stroke in this case being $3\frac{1}{2}$ in. by $4\frac{1}{2}$ in. On the basis of 800 revolutions per minute this engine should give barely 3-h.p., but I suppose the revolutions were calculated to be at least 1,500 normally. It seems to me that the advertised horse-power of engines is in a more or less chaotic state, and it would be an immense boon if the Automobile Club would issue to the motor papers a carefully-compiled list, giving actual b.h.p. of single and multiple-cylinder engines, say from 3 in. to 5 in., and taking, say, 800 or 1,000 revolutions per minute as a standard speed. At present one may buy a 10-h.p. car with an engine having double or half the cylinder capacity of another motor similarly rated! In counties like Cornwall it is really a most important matter that one should know the actual horse-power he is buying, for the prospect of touring in this county chiefly on bottom speed is not an inviting one for anybody who has invested in an over-rated but under-powered car.—Yours faithfully,

HARRY RICH.

MECHANICALLY-OPERATED INLET VALVE FOR $3\frac{1}{2}$ -H.P. BENZ CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—For the last three months I have been running my $3\frac{1}{2}$ -h.p. Benz with a mechanically-operated inlet valve, and have found the result satisfactory. As to the query raised by "A. G. J." in the *Journal*, I cannot see that there is any possibility of a back fire, as the mechanically-operated valve cannot open or close, except at the proper time.—Yours truly,

C. PETERSON WEEKS.

THE QUALITY OF PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We feel it our duty to put the motoring public on their guard so that they may test the quality of the petrol supplied to them. We have for some years mostly used Pratt's motor spirit, and up to within a few months ago it proved sufficiently satisfactory. The last few months we have had considerable trouble in getting our motors up to power on the test bench, and have also received many complaints from customers to the effect that they could not get their cars to go properly. We must confess that we could not understand where the trouble was coming from; it never occurred to us to try the petrol, other than to be sure that fresh stuff was being used, as, having practically had no complaints for years, we were lulled into security as to the quality of the spirit itself. Suddenly we ascertained the cause of the trouble, and on testing an entirely new consignment of Pratt's motor spirit on March 7th we found it to vary in specific gravity from .720 to .800! At last the representative of the Anglo-American Oil Company confessed that that was the kind of spirit we had been supplied with recently, and, moreover, the Oil Company wrote us: "We do not guarantee our brand of motor spirit as being of any specific gravity; owing to the great demand for this spirit, the refiners supply it as motor spirit only, no gravity being specified. The spirit supplied is in every way suitable for the purpose it is required."

In every way suitable, forsooth! Motors on the test bench with Pratt's motor-spirit only gave between 14 and 15 b.h.p., and we were

completely puzzled as to what was wrong. The substitution of another spirit, which was guaranteed in a letter as .680 to .685 specific gravity, enabled the same motors to develop 20 b.h.p. and over!—Yours truly,

CHARLES SANGSTER.

[With regard to the specific gravity, we would point out that no temperature is given in the foregoing letter; while we understand that the Anglo-American Oil Company have never given a guarantee as to the specific gravity of the spirit they supply.—Ed. M.C.J.]

MR. THOS. BROWNING, of 79, Marlborough Mansions, West Hampstead, writes:—"I have had a grease box left here which does not belong to me; it is marked, 'Louis Le Febvre Bte. S.G.D.C. No. 3.' Do you think you can find the owner? It was found on the Hendon road. I shall be pleased to hand it over with the finder's name if he will write me."

CLASSIFICATION OF MOTOR BICYCLES.

MR. E. H. ARNOTT has sent a letter to Mr. F. Straight, Assistant Secretary for motor-cycling to the A.C.G.B.I., re handicapping and classification for motor-bicycles, in which he says:—"At present the tendency seems to be, as in the case of the Reliability Trials, to classify by cylinder capacity. I think that if this standard is adopted for races a great mistake will be made, and that the standard should be fixed by weight, and this for many reasons.

"I believe that the objects of the racing rules will not be only ease of handicapping, but also the improvement of motor-cycles in general by competition, the abolition as far as possible of freaks, and the use of commercial engines, and the question is, how is this to be done? To my mind, the cylinder capacity standard absolutely fails in this, and is most unreliable as a means of handicapping, as the following points have in addition in each case to be taken into consideration when determining the horse-power: number of revolutions per minute; compression; size and weight of flywheels; size of valves, etc.

"The tendency of the cylinder capacity standard would thus be to encourage very high compression, and freakishly large and heavy flywheels, as these points would not be penalised in any way. As far as the handicapper is concerned, his lot would not be at all happy. In the case of two machines, apparently identically the same, being entered for a race (say $2\frac{1}{2}$ -h.p. with bore and stroke 76 by 76), it would not be possible for the handicapper to know that one of the engines had had a little turned off the top of the cylinder, and the compression increased—thus altering its power for better or for worse as the case might be—and it would be nearly impossible to check this. Handicapping, in the strict sense, must for motors, I think, be very much of a lottery, and I believe the simplest and best way to arrange these matters would be to work on the Continental lines, namely, *classes* confined to certain *weights*—no handicaps at all in the strict sense. The advantages of the weight system include ease of checking, only a weighing machine being required; the encouragement to manufacturers to reduce weight, this being equally as important as securing the greatest amount of power from a given cylinder capacity. The beneficial results from this system are very fully demonstrated by the enormous reduction in the weights of cars during the last two or three years, the strength apparently being in no way sacrificed. The same remark applies to continental motor-bicycles, and an example can be found in the Werner $2\frac{1}{2}$ -h.p. motor-bicycle, which is some 30 lbs. lighter, I believe, than any English motor-bicycle of the same power.

"One other feature, from a sporting point of view, is that owners of English bicycles would be able to compete in continental races, if the weight limits were fixed at the same standards. At the time of writing there is, I believe, not a single English motor-bicycle entered for the Paris-Madrid race, the reason for this being purely the question of weight, as there is not an English motor-bicycle of, say, even $2\frac{1}{2}$ -h.p. which weighs less than the 50 kilos (110 lbs.), without accumulators, specified by the French authorities.

"There is the possibility that before many years are gone England may wish to push the sale of motor-bicycles on the Continent, as has been done with ordinary cycles, but I am quite sure that unless the English motor-bicycles are run in the continental races, and run successfully, England's chance of a market will be hopeless, as the value of long distance racing tests is very fully recognised there. The classes on the Continent are:—

30 kilos (66 lbs.) and under,
50 kilos (110 lbs.) and under,
250 kilos (550 lbs.) and under,

in all cases without accumulators. I would suggest a further class of 70 kilos (154 lbs.), and under; this would include Excelsior, Riley, and other makes using M.M.C. engines, and also Humbers and others."

AN EXPENSIVE STABLE.

A MOTOR-CAR belonging to Mr. H. H. Raphael broke down, and was pushed by the driver into a stable yard in Great College Street, N.W. The manager protested, and said he would charge 25s. a week if it was left there. Judge Bacon has sanctioned this charge, which was contested on the ground of exorbitance.

* Where no alleged speed is given it is understood to be above the legal limit.

* Motor Cycle Cases.

MOTORISTS in Grahamstown, South Africa, have their little worries and perplexities. Percy Roberts, of Messrs. Davies, Marsh and Co., engineers, has been fined for riding a motor-bicycle at a speed exceeding the rate allowed by municipal regulations. Despite the fact that evidence for the defendant showed the machine was geared down to a pace of 8½ miles per hour, the magistrate convicted, and since the case motor-bicyclists in the small town (which, by the way, has very little traffic) have been so keenly watched that it is almost advisable for them to walk beside their machines. The local regulations allow a speed of not more than ten miles an hour.

HIRING MOTOR-CARS.

IN Edinburgh Sheriff Court recently, Sheriff Henderson pronounced judgment in the action at the instance of John Buick, Edinburgh, against the New Rossleigh Cycle and Motor Company, Ltd. Plaintiff stated that he and seven others hired a motor-car and man for the sum of £2 2s. for the purpose of going to Peebles on August 10th, 1902. During the homeward journey the car was overturned, the whole of the occupants being thrown on to the road and injured. The Sheriff dismissed the action on the ground of incompetency and granted the defendants' expenses. As a reason the Sheriff said the action was raised only at the instance of one of the eight persons who suffered damage. The case was appealed to the Sheriff-Principal, but in the meantime the other seven gentlemen concerned had raised actions for damages against the defendants. In the circumstances Sheriff Rutherford has recalled the Sheriff-Substitute's interlocutor, repelled the defendants' first plea-in-law, remitted the case to the Sheriff-Substitute to be conjoined with the supplementary petition, and reserved

all questions of expenses to be disposed of along with the expenses on the merits.

POLICE TRAPS.

THERE is a telephone trap between the police station at Berkhamstead and Tring—a good stretch of five miles.

THE police are very active in the neighbourhood of Slough, especially on the stretch of road between Colnbrook and Slough. On Sunday week they were on the watch in the middle of High Street, Slough, with stop-watches and field glasses. Motorists should also be careful between Maidenhead Bridge and the town.

NO LIGHT.

A POINT of importance to motorists was before the Woking magistrates on Saturday, when the driver of one of the motor-cars used by Mr. J. A. Fyler, M.P., during the recent election in the Chertsey Division, was summoned for not showing a rear light. The bench inspected the car, and found that, although lamps were carried on both the near and off sides, the rear disc of neither could be seen from a point immediately behind the centre of the car at a distance of twenty yards. They therefore imposed a nominal fine of 5s., on the ground that there had been no intentional evasion of the law.

THE Penrith and District Road Carrying Company, Limited, has just been formed.

MR. CHARLES E. SHALDERS has opened a motor garage at 43, Northgate Street, Great Yarmouth.

KING EDWARD and King Carlos have been enjoying motor car trips along the Portuguese coast from Cascalo.

MR. N. LITTLEJOHN has opened a motor-car repairing establishment at the junction of Station Road and East Street, Farnham, Surrey.

THE Vulcan Motor Manufacturing and Engineering Co., Ltd., have now fully equipped their new works in Hawesside Street, Southport, where a large stock of sundries, oils and petrol will be kept on hand. Storage accommodation for about 100 cars is also available. The company is bringing out a new gear-driven car.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

COMMENTS.

THE first of a series of five monthly runs in connection with the Reading Automobile Club's challenge cup for reliability took place on Friday, the 10th inst., to Wantage. Leaving the Club premises in Reading at 10.30 a.m., the cars proceeded along the Oxford road as far as Streatley, and thence *via* Blewberry. Twenty-four members and friends sat down to luncheon at the Bear Hotel, Wantage, and, after a look round the historic town, returned to Reading via Wallingford. Those taking part in the run included Messrs. A. H. East (8-h.p. Corre), with the Club president (Dr. J. H. Walters) on board, C. H. Dodd (8-h.p. Renault), H. Callas (Mabley), Dr. A. C. Major (Baby Renault), Whitehead (8-h.p. M.M.C.), W. L. Creyke (30-h.p. Panhard), Dr. Claude Truman (4-h.p. Rochet), J. V. Moinet (Ixion motor-cycle), G. L. Brigham (Mabley), A. E. Major (16-h.p. Benz), A. Phillips (Royal Enfield motor-cycle), A. E. Pocock (7-h.p. Benz), F. R. C. Joyce (motor-cycle), E. J. Wickens (10-h.p. Panhard) driven by Mr. Parratt, A. C. Brewerton (8-h.p. M.M.C.), and Albert E. Newton, Hon. Sec. (De Dion tri-cycle).

The Late Count Zborowski.

ON Thursday of last week the remains of Count Zborowski were carried to their last resting-place at Burton Lazars, near Melton Mowbray. The principal mourners were the Countess Zborowski, the Count and Countess de Montsaunin, the Countess du Luart, Colonel and Mrs. Lionel L. Powell, Mr. Enthoven, Mr. Covenen, Mr. M. Darcy, Mr. H. G. Bateman, Mr. Knapp Fisher, and Mr. Fisher, jun. The first portion of the service was conducted at the parish church of Melton Mowbray by the Rev. R. Blakeney, vicar and rural dean. From there the procession was re-formed and proceeded to Burton Lazars. Conspicuous among the flowers on the coffin was a white cross from the Countess Zborowski, while among those who sent wreaths were the Automobile Clubs of France, Nice, Germany, and Great Britain and Ireland. The latter Club was represented by Messrs. Frank H. Butler and J. D. Siddeley.

Motor 'Buses at Bolton.

ALTHOUGH the County Palatine is being covered by a spidery network of tram-lines, there are Lancashire Corporations observant of the merits of the automobile, and it is satisfactory to hear that the electrical engineer of Bolton has been requested by his Town Council to ascertain the terms upon which motor-'buses could be obtained for a six-months' trial. We hardly understand why the electrical engineer should have been invited to do this, seeing that the matter comes within the province of the Committee concerned with locomotion. Still, the suggestion to see what can be done with motor-'buses is interesting, and the position of the town of Bolton gives it an importance that should encourage manufacturers to do their best to secure reliable vehicles for the Corporation.

A Change in Surrey.

NOT only are the police authorities becoming converts to automobilism, but the county magistrates are recognising the importance of the new movement. At the Easter sitting of the Surrey Quarter Sessions the Standing Joint Committee, representing both the County Council and the magisterial bench, recommended the erection of a garage near the county hall for the convenience of those having business at the sessions who are in the habit of travelling by automobile or bicycle. Is Surrey repentant? And are we to regard this innovation—worthy of imitation throughout the country—as the first fruits of a conversion which may have effect in more tolerance on the part of the police? It would be well if satisfactory answers could be obtained ere long, or the hotel keepers and others on the Surrey roads will suffer, as they did last year, from the loss of trade occasioned by motorists forsaking their pleasant roads in favour of paths where policemen do not lurk behind hedges nor regard the motorist as an insect to be exterminated, if possible.

A Motor Track.

WHILE interest in the Irish motor course is growing things are proceeding quietly with the arrangements for the provision of a motor track in England. This will soon become an accomplished fact, Purley being the site selected. We have heard little of late as to the suggested tracks at Lowestoft and Clacton, and it would appear that, with official sanction, the Purley course will be the one most favoured by motorists.

Water Wanted.

A FIRM that purchased one of the heavy vehicles shown at the Agricultural Hall Exhibition has experienced some difficulty in obtaining water. This is a matter that is becoming increasingly important in view of the development of this class of traffic, and local authorities in the suburban districts should provide facilities for the refilling of tanks at convenient places. Objection is taken to hose pipes being thrown into horse troughs—a procedure not to be commended—but the tanks must be refilled somewhere, and we shall be glad to hear of places in London and Middlesex where provision is made for this purpose. Seeing the cleanliness of the motor lorry as compared with horse-drawn vehicles, and the thinning of the street congestion which would be possible by the universal adoption of the automobile, we would urge upon local authorities the advisability of giving attention to the subject.

Fatal Accidents.

THE necessity for careful driving on the part of motorists is emphasized by two deaths recorded this week. An aged woman knocked down by the Marquis of Downshire's automobile has succumbed to her injuries, and early this week a man was killed on Woodhouse Moor, Leeds, by an automobile driven by Mr. W. E. Nicholson. Mr. Nicholson states that the deceased

had begun to move from the roadway in response to his horn and then stood still gazing upwards. In order to pass him the car was turned in, and at that moment the man, stepping back, was knocked down. There is no doubt that the nervousness of pedestrians and their uncertainty in crossing roadways is one of the harassing worries with which motorists are familiar.

To the Arctic Circle.

A MOTOR-CAR tour to within $2\frac{1}{2}$ degrees of the Arctic circle has been mapped out by Mr. Charles J. Glidden, of Boston, Mass., U.S.A., who last year made a 5,000-mile tour through southern Europe. Mr. Glidden expects to leave New York early in June, and will start on his car from London on the 20th of that month. He will tour through the Devonshire district and Wales to Holyhead, where he will cross to Dublin to witness the Gordon Bennett cup race. Afterwards he will make, for Belfast, where the steamer to Glasgow will be taken. Then by road to Edinburgh; by steamer to Christiansand, Norway; by road to Bergen, Trondhjem, and north to 64 north latitude, within $2\frac{1}{2}$ degrees of the Arctic circle; south to Christiania; east to Stockholm; and south-west to Gothenburg. At this port the steamer will be taken to Frederikhavn, Denmark, the tour being continued to Frederica, Strib, Nyborg, Korsor.

Ready for the Arctic Circle!

[Allgemeine Automobil Zeitung.]

Copenhagen, Kiel, Hamburg, Bremen, and Amsterdam and the Hook of Holland. At the latter place the steamer to Harwich will be taken, the tour being concluded by the journey by road to London. Altogether the tour will extend to 4,500 miles, and Mr. Glidden expects to cover the distance in about forty-five days.

An Inaugural Run.

THE inaugural meet of the Norfolk Automobile and Launch Club on Saturday did credit to the patron, the Prince of Wales, and to Lord Claud Hamilton, the president. About thirty automobiles assembled on the Marine Parade at Yarmouth, the company including Baron Baretto, on a 20-h.p. Wolseley; Mrs. Edge, who drove a 16-h.p. Napier; Messrs. F. F. Wellington and M. Brooke, on Brooke cars; Messrs. G. N. Mann and J. Griffin, on Gladiators; Messrs. H. L. Clark, H. W. Egerton, T. J. Goldie, and W. Spelman, on De Dions; and Mr. H. Watts, on a Daimler. Mr. A. H. King drove Mr. T. Bradley's Daimler, and the Mayor of Norwich was among the passengers from the cathedral city to the seaside town, where all had a spin to the Harbour's Mouth. The cars formed a pleasant procession along the Drive.

Luncheon at Yarmouth.

A GOODLY company gathered in the Assembly Rooms, where luncheon was served under the chairmanship of Mr. G. M. Chamberlin, the company including, in addition to those already named, the Mayor, Town Clerk, and Chief Constable of Yarmouth, and the Town Clerk of Norwich. After the loyal toasts had been honoured, Colonel Diver, the Mayor of Yarmouth, congratulated the Club on having a hundred members, and suggested that through the fertile brain of the Borough Surveyor means might be found to provide at no distant date a garage in the town. The Chairman replied, paying a hearty tribute to Messrs. Mann and Clark for what they had already done, and to Mr. J. W. Howlett, who had come forward to carry on the work of the former gentleman. After other pleasantries the company dispersed, the cars rapidly going their various ways to different places in Norfolk.

Motor Boat Racing.

IN the course of his speech Mr. H. L. Clark said he was very proud to be connected with the motor-launch section, because last year, before they had a Norfolk Automobile Club, when he wished the Yacht Club to take up motor-boat racing, he was laughed at. Gentlemen who sailed yachts wondered why anyone should want to race motor-boats on the rivers. This year he had succeeded in getting the Royal Norfolk and Suffolk Yacht Club to hold its first motor-boat race, which would take place at the regatta at Oulton Broad in August, and those yachting gentlemen, who wondered why one motor-boat should be wanted to go faster than another, had been convinced of the value of motor-boat racing. The competition for the Harmsworth Cup would settle the question of motor-boat racing in this country.

The Dangers of Sport.

COUNT ZBOROWSKI'S fatal accident has drawn attention to the dangers of sport—dangers which are apparently incidental to every pastime and which are perhaps minimised to a greater degree in automobilism than in any other form of sport. Football, cricket, hunting, steeplechasing, rowing, have all their risks, and a glance at the career of Mr. Thomas Pickernell, the famous gentleman jockey, who now lives in retirement near Birmingham, is a remarkable testimony to the seriousness of the disasters that may befall sportsmen. In one race Mr. Pickernell broke his thigh, and ever afterwards one leg was $2\frac{1}{2}$ in. shorter than the other. Subsequently he broke both his wrists, fractured one of his elbows, broke his collar-bone in two places, dislocated his shoulder, sprained his ankle, injured his back, was ten or a dozen times rendered unconscious, had his jaw broken in three places, lost the sight of one eye and injured that of the other. We merely recall this fact to indicate that automobilism is no more hazardous than other sporting pursuits.

Wolseley Developments.

IN our issue of February 14th we announced that Messrs. Vickers, Sons and Maxim, Limited, were about to commence the manufacture of motor-cars at their works at Crayford, Kent. We are now able to mention that this step will be taken without delay, and that under the supervision of Mr. H. Austin a two-seated voiturette on the familiar Wolseley lines will be introduced. This will have two speeds and a reverse, and will weigh about 8 cwt. So that the voiturette may be placed on the market at a reasonable price, a thousand vehicles have been put in hand and deliveries will be commenced about July. The Wolseley Company has just received an order for two 10-h.p. cars of the wagonette type for the Metropolitan police authorities. These will be used for official work in and around London.

The Police and the Car.

ONLY a fortnight ago we reported that the Chief Constable of Essex was conducting some investigations in his county, his progress from place to place being facilitated by the adoption of a motor-car. The news that the Metropolitan police authorities have now recognised the automobile and intend to employ it in the public service will be good tidings to Mr. Cathcart Wason, M.P., who has been attempting to incite the Home Office to establish a squad of police motor-cyclists. Developments are crowding thickly upon us, and now that the Prince of Wales pays ordinary calls in his car, and the Prime Minister does his round of social visits on the automobile, the universal adoption of the motor-car is only a question of time, and that not very far off.

Manufacturing in Quantities.

THE fact that the manufacture of motor-cars in large quantities—the numbers running beyond three figures—has been commenced on this side is evidence of the great advance for which the industry is preparing, and carriage builders in many provincial towns are now endeavouring to make up the position they have lost by ignoring the coming of the motor. Agencies are multiplying and garages rising in every locality. Verily the motor-car is entering upon the high road to Prosperity—with a capital P.

What next?

MOTOR fire engines, mail vans, ambulances, delivery carts, municipal vans and omnibuses are becoming the ordinary commonplaces of the streets. Official sanction has been given by the slow-moving War Office and the lethargic local authorities throughout the country. And now that the police are acknowledging the automobile we may expect to see a "motor Black Maria," thus popularising the automobile among a section of the population hitherto unreached by the new movement.

Motor-Cars on Show Grounds.

NOT often do we find Welshmen so unappreciative of the spirit of progress as are the members of the United Counties Hunters' Society, which has just decided that in connection with its show at Ystrad in August a charge of £2 will be made for the admission of motor-cars to the ground. It was said that at the last show of the society there were eleven motor-cars present and they were a nuisance. We should have thought that the presence of automobiles would have been welcomed, the occasion being made a fitting opportunity to accustom the horses to vehicles which will relieve certain classes of animals from much drudgery and many burdens.

Petrol Car Patents in the United States.

As an outcome of patent litigation there has just been formed in New York an association of leading American builders of petrol motor-cars, to be known as the Association of Licensed Automobile Manufacturers. All the members of the association have acquired licence under the Selden patent, and in addition all the patents owned by the various members will be pooled, and any member granted a licence under any one of these patents. The membership list, which at present comprises nineteen firms, is not yet closed, and it is intended to bring into the association all responsible and well-established manufacturers of petrol cars, as well as importers. The present members are the owners of about 400 patents on automobiles, which cover practically every part of hydrocarbon vehicles. The formation of the association is the outcome of the infringement suit brought by the Electric Vehicle Company in 1900 against the Winton Motor-Carriage Company and others for infringement of the patent granted

to Mr. George B. Selden, of Rochester, New York, in 1895, and for which application was made in 1878. The patent covers, broadly, the combination of a compression internal-combustion engine, of the liquid hydrocarbon type, running faster than the driven wheels, with a disconnecting device or means between the engine and the driven wheels, and the whole so disposed and arranged as to leave the upper part of the vehicle free for the conveyance of passengers or goods. The exclusive licence rights of the patent, purchased by the Electric Vehicle Company in 1899, are thus now controlled by the new Association of Licensed Automobile Manufacturers. In other words, it may be stated that the representative makers, after having seen a test case decided in favour of the validity of the patent, have agreed to recognise it, pay licence fees, and to pool their interests in order to compel all others to do the same.

Mr. H. A. Jones, of Sydney, N.S.W., and the Decauville Car which he has used in Great Britain and Australia.

Motor-Car Imports and Exports.

THE returns now available relating to the British imports and exports of motor-cars and cycles during March last show an increase as compared with the same months of last year, both as regards the imports and exports. To deal first with the imports, a new record has been established. no less than 571 cars and cycles being imported into this country last month, the value of the same being returned at £170,888. The value of the "parts thereof" is given as £35,408, so that we get a combined total of £206,296, as compared with £94,735 in February last and £70,513 (representing 255 cars) in March, 1902. Some of the imports were only of a temporary character, being reshipped to foreign destinations. Thus last month the reshipments comprised fifteen vehicles, amounting in value to £7,370, and £2,120 of parts, bringing down the net imports in March to £196,806, as against only £65,791 in the same month a year ago. For the first quarter of the year, the net imports of motor-cars, cycles, and parts stand at no less than £447,966, or almost treble those during the same period of 1902. As regards the exports of automobiles of home manufacture, the shipments during the past month amounted to 54 vehicles of a value of £15,303. Of parts the exports attained a value of £3,799,

making a combined total for March of £19,102, as compared with £26,229 in February last, and £5,576 (representing fifteen vehicles) in March, 1902.

New Motor-Car Works at Burton-on-Trent.

THE large new motor-car building works of the Ryknield Engine Co., Ltd., at Burton-on-Trent, were officially inaugurated on Thursday. The company was formed in February, 1902, with a capital of £30,000, of which about £20,000 has been called up. A speciality will be made of light delivery vans to carry from 1 ton to 30 cwt., while for pleasure purposes a 10 to 12-h.p. car driven by a vertical two-cylinder engine will be put on the market. This will follow the usual modern practice in general design though possessing several features of a distinctive nature. For next year it is intended to bring out a four-cylinder car of from 16 to 20-h.p. The works are located on an excellent site of about 6½ acres facing the main line of the Midland Railway, and about 200 yards from the station. They have been well designed to admit of easy enlargement at any time without interfering with the work in progress, and consist of seven bays having a total frontage of 120 feet and a depth of eighty feet. Needless to say the machine tools installed are all of the most modern type. The erecting shop is a lofty bay at the south end of the building, the extra height being provided to admit of a travelling crane, which will shortly be installed. There is also a roomy erecting pit running the whole length of the shop. Special attention will be paid to the system controlling the passage of work through the shops and the accurate recording of time and costs. This is an adaptation of the "card system" now so largely used in America, the object being to ensure an accurate record of the cost of every article manufactured with the least possible amount of clerical work. In this connection it may be mentioned that the time spent by each man on each piece of work will be recorded on a Calculograph, a machine of recent American invention which at the commencement of a job stamps on a card two dials, and on the card being again inserted at the end of the job, stamps an arrow on each dial, showing with great accuracy the hours and minutes elapsed. With a view to obtaining the best class of employees, and to encourage them in their work a mess-room has been provided at the east end of the power house, in which a liberal supply of technical papers and magazines will be placed for their use. At the west end of the ground, close to the entrance, is situated the Repairs Department, consisting of a well-equipped repair shop, a "running shed," capable of holding about twenty cars, with an inspection pit running the whole length of the building, and a petrol store, where a large stock of petrol and lubricating oils and greases will be carried. The work throughout is of a most substantial description and reflects great credit on the various contractors.

Easter and the Southern Roads.

BRIGHT sunshine at intervals, snow clouds with biting showers, roads in fine but dusty condition, and plagues of cyclists, seems to sum up generally the motorists' Easter holidays. Policemen, except in one locality, were conspicuous by their absence, the weather, no doubt, being too cold for hiding behind hedges. The country was looking its loveliest, and the crowds of motorists testified to the wonderful progress made with this form of travel. Recognition between friends was almost impossible, as eye-shields were indispensable, and as most people had new cars and there is a certain similarity in them all, the reason for non-recognition was apparent.

At St. Albans.

SEVERAL motor-bicycles were observed resting against the railings of the old Abbey Church at St. Albans, and outside the Pea Hen Hotel, at one time, there were half-a-dozen cars, their owners sheltering from the snow that gave almost a wintry aspect to the scene, despite the brilliance of the sun that peered

forth on motor and horse alike. Taking advantage of the cheery morning North London motorists went into Hertfordshire in dozens, and many cars were heard hustling through the villages in quite as merry a way as went the stage coaches in the olden times. A run into the country almost any day reveals the coming ascendancy of the automobile.

The Inflation of Balloons.

MR. J. N. MASKELYNE and the Rev. J. M. Bacon have been for some time past carrying out a series of experiments with regard to the inflation of balloons. The new method consists of inflation by means of hot air, the air being heated by the vaporisation of petroleum. The apparatus for generating the hot air is carried in the car of the balloon. A trial took place on Saturday at Cold Ash, near Newbury, and demonstrated the success of Mr. Maskelyne's invention. A balloon of nearly seventy thousand cubic feet capacity was inflated by patent burners in less than an hour, the burners vaporising only a few gallons of oil. The balloon was then tested for its lifting power, and the test proved very satisfactory.

The Gordon Bennett Race.

THE eliminating test for the American Gordon Bennett team was held on the Long Island track on Tuesday last, as a result of which Messrs. Alexander Winton and Percy Owen on Winton's, and Mr. L. P. Mooers on a Peerless, will represent the United States. The French team will consist of two Panhard cars, driven by Messrs. Rene de Knyff and Henri Farman, and a Mors piloted by M. Henri Fournier. It is stated that the two French firms propose to hire a special steamer to convey the cars to Dublin and serve as a floating hotel and storehouse of parts and accessories in case of need. It is reported that in anticipation of Germany carrying off the Cup a course has been already selected for next year's race! The Duke of Mecklenburg has consented to offer his estate, affording a course of over 300 kilometres. Baron von Hammerstein, Minister of the Interior, is also said to have been requested to grant permission to run the race from the limits of Berlin through the Mecklenburg estate.

PONTEFRAC is to be the rendezvous of the Yorkshire Automobile Club to-day (Saturday).

A MOTOR omnibus has been put upon the road by the Hastings and St. Leonards Omnibus Company.

THE Scottish Motor Manufacturers and Traders' Association was formed at a meeting in Edinburgh on Tuesday.

WEDNESDAY, the 22nd inst., is the last day for receiving entries for the quarterly 100 miles trial of the A.C.G.B.I., to be held on the 24th inst.

THE Hon. J. Scott-Montagu has become President of the Southampton County Motor Club, which had its opening run to Beaulieu on Good Friday.

ALFRED DUNHILL, LIMITED, has been registered with a capital of £40,000 to acquire the business carried on by Mr. Dunhill, at Euston Road, N.W.

AMONG social news of interest to motorists is the announcement that a marriage has been arranged between the Hon. Ernest Guinness, second son of Lord Iveagh, and Cloe, daughter of Lady Russell and the late Sir George Russell, of Swallowfield.

THROUGH the enterprise of the Earl of Leitrim, tourists in the north-west of Ireland this summer will be able to traverse with comfort and pleasure a picturesque district of Ireland which is badly served by railways. There are now under construction at the works of Stirling's Motor Carriages, Limited, three motor coaches to carry fourteen passengers and their luggage, and capable of easily climbing the mountain roads of the north-west. The route to be served is about thirty-eight miles long, beginning at the Strabane Railway Station, and terminating at Rosapenna, which is a fine golfing district and furnished with a commodious and well-appointed hotel.

THE IRISH FORTNIGHT.

MR. ROGER WALLACE and Mr. J. W. Orde have been in Ireland during Easter looking after the organisation in connection with the race, and the Hon. C. S. Rolls was at Kildare on Monday, having journeyed thither by car and water. On his 7 h.p. Panhard he went from London to Holyhead—a distance of 280 miles—in 13½ hours' running time.

AMONG the firms on or near the course from whom petrol can be obtained are Messrs. Duthie, Large and Company, Athy; Mr. C. Church, Curragh Camp; Mr. Dennis Donohoe, Naas; and Mr. M. T. Woods, Newbridge.

IN Belfast the Northern Motor Company undertake motor-car repairs and also stock petrol. Motor-car spirit can also be obtained from Messrs. J. and J. Haslett, North Street, Belfast. The next town en route to Dublin is Lisburn, and our correspondent informs us that Mr. Barbour, who owns a car, would doubtless help in the matter of petrol. At Lurgan, Mr. William Jeffers keeps a small stock of spirit and would help in a difficulty. Messrs. Hegan and Co., Portadown, are agents for Pratt's motor spirit, and keep a stock. Travelling via Hillsborough and

Messrs. Wheatley's cup, and a trophy valued at £50 by the Royal Ulster Yacht Club.

As it is estimated that the road repairs in connection with the Gordon Bennett race will cost at least £1,000, it has been decided to open a supplementary subscription list, and Mr. Paris E. Singer has headed this with the sum of £100. The committee of the A.C.G.B.I. will be obliged if motorists who have not yet assisted this praiseworthy movement will send contributions of 10s. or more to Mr. J. W. Orde, club secretary, as early as possible.

THE special map of the Gordon Bennett course which Mr. R. J. Meeredy has had in preparation for some time past has been adopted by the Automobile Club of Great Britain and Ireland as their official map for the International race. This will be published about the end of the present month.

A SMALL group of sightseers, about twenty cars, and two policemen standing outside Humphrey's place in the Buckingham Palace Road, S.W., on Good Friday, was all the excitement attendant upon the weighing of the leviathans entered for the Gordon Bennett race. Several well-known motorists were present in mufti, and the weighing operations were superintended by Mr. Worby Beaumont and Mr. Lyons Sampson,

The Ruins of the Ancient City of Timgad.

The Trajan Arc de Triomphe at Timgad.

[La Vie au Grand Air.]

MOTORING IN ALGERIA.

Dromore to Banbridge, no petrol is kept in any of these places, but repairs are done by the Banbridge Engineering Co., or Banbridge Foundry Co. The next town is Newry, where both repairs and a supply of spirit can be arranged for, Messrs. Connor being agents. Should anything be required in the neighbourhood of Castlewellan Mr. R. J. Hudson, who is a private owner of a car, will help, and any repairs can be undertaken by Mr. R. Stevenson. Both these gentlemen reside in Rathfriland.

THURSDAY, July 2nd, has been definitely fixed as the date of the Gordon Bennett race, and Lieut. Mansfield Cumming has been informed that his car has been placed first on the list of cars held in reserve. Arrangements are being made to secure an adequate supply of petrol being in the country, and the improvement of the roads is shortly to begin, Mr. James Gordon Bennett being among the latest contributors to the fund raised for the purpose by the A.C.G.B.I. Negotiations are now proceeding with local landowners for the provision of a club enclosure on the Athy-Kilcullen road, a quarter of a mile south of the Ballyshannon cross-roads.

AMONG the prizes offered in connection with the Irish Automobile Fortnight, in addition to those previously notified, are a 200 guinea challenge cup given by the Dunlop Company,

assisted by the Club engineer. The process of weighing was a slow one, the cars having to be first emptied of water, petrol, etc., and then to be filled up again on the weighbridge, so that they could be driven off. The only car absolutely stripped for racing was one of the Napiers, the other two cars of the same make being in their ordinary fittings. The Star, a most creditable vehicle, and one from which much is expected, had its seats upholstered and scaled about 30 lbs. under the thousand kilos. The Wolseley 50-h.p. was also present, and certainly looked like a greyhound, the workmanship being very generally admired, although a general opinion was expressed that if perchance a little doggie should get underneath the car, then off would come the carburettor, which seems very near the ground indeed. The car did not stop to be weighed, the owner, Mr. Mansfield Cumming, having apparently become tired of waiting. Girling, the mechanic, started the motor, let in the clutch, and the car simply jumped away and was out of sight in a moment. It was after two o'clock before the weighing was completed, and then the "giants," in comparatively silent procession, were driven to the Club garage, where they were afterwards officially sealed, etc. The Napier cars weighed 16cwt. 3qrs. 2lbs.; 18cwt. 1qr. 10lb., and 18 cwt. 1qr. respectively, and the Star car, 19 cwt. 1qr. 15lb.

D

THE VEEDER SPEED INDICATOR.

THE Veeder Manufacturing Company, which is well known for its Veeder cyclometer, has lately introduced the novel device for indicating the speed of motor-cars illustrated herewith. The Tachometer, as it is called, comprises two principal parts, the pump, consisting of a casing enclosing a paddle wheel mounted on a shaft, and the indicator, embracing a glass indicator tube, a scale and a reservoir. The periphery of the pump is connected with the bottom of the glass indicator tube by suitable passages or tubing, and the bottom of the reservoir communicates with the centre of the pump. The Tachometer is filled with a suitable liquid, generally coloured alcohol, so that when at rest it stands on a level with the zero mark on the scale at the side of the indicator tube. The surface of the liquid in the reservoir will be slightly lower than in the tube on account of the capillary attraction of the latter. When the paddle wheel in the pump is revolved, the centrifugal force draws down the liquid in the reservoir and forces it up in the indicator tube. The vertical height between the two surfaces will be approximately proportionate to the square of the speed of revolution. The connecting tubes or piping may be of any desired length, provided there is at all points an upward inclination from the pump to the indicator.

Fig. 1.—General View.

Fig. 2.—Sectional View of Indicator.

For convenience the reservoir is placed close to the indicator tube and communicates with the top of the latter, so that the instrument may be sealed to prevent evaporation, and if the liquid should be forced by excessive speed to overflow the top of the tube it will flow back into the reservoir. If the reservoir is placed in front or behind the indicator tube on a moving vehicle, then, when the speed of the latter changes, a change in level between the two surfaces of the liquid will take place on account of the inertia of the liquid and independently of the change due to the pump. A similar change will take place when the indicator is tipped to one side or inclined when the vehicle is going up or down a hill. These changes are, however, very slight, and in ordinary practice are negligible. They may be entirely overcome by making the axis of the reservoir concentric with the axis of the indicator tube. It will be seen that the instrument is extremely simple in construction, and can be made very durable, since the only wearing parts are the shaft and its bearings. To adjust the level of the

liquid to the zero mark on the scale the cap on top of the reservoir tube may be removed and the liquid poured in, or the liquid may be drawn off at the bottom by a suitable cock placed there for that purpose, as the case may require. The scales are graduated to show miles per hour and are of two lengths, 6 in. and 12 in. The shorter scales are used for maximum speeds of either twenty, thirty or forty miles per hour, and the longer scales of forty, fifty, sixty, or even higher speeds if desired. The scale shown in the illustration is a 6 in., and will indicate a maximum speed of thirty miles per hour. The pump is driven by suitable gearing either direct from one of the road wheels or from some shaft positively geared on the wheels. The ratio of the gears used depends on the size of the wheel and the scale desired. The indicator is intended to be placed on the dashboard.

HINTS ON DRIVING PETROL CARS.

A GREAT many people are about to receive or have just received petrol cars who are unfamiliar with their operation, and therefore, at the risk of repetition of much that has appeared in these columns, it may not be amiss to make some general remarks upon the handling of these vehicles. It is a part of the sport of operating a motor vehicle to do so in the most effective manner, for thus come into play the "head qualities" which impart to all forms of pastime the personal element, the cultivation and exercise of which add zest to the control of even purely insensate and mechanical creations. The man who drives a spirited pair gains his enjoyment partly from his sense of control over them, and partly from his exercise of skill in getting the work out of them most effectively and with the least wear and tear on the animals themselves. The man who sails a yacht enjoys the exercise of his skill in so handling matters as to take advantage of every condition of wind and sea, and thus covers the course with the utmost speed consistent with comfort and safety. In an exactly similar way the true automobilist gains as legitimate and genuine a satisfaction in so taking advantage of every peculiarity of the mechanism under his control and of every diversity of road surface and grade as to feel that the forces at his command are most efficiently applied with due regard to the endurance of the mechanism which is faithful to the motion of his hand, even to the point of its own destruction. This is the main pleasure of running a motor-car, apart from the change of scene enjoyed and the very elementary pleasure of motion.

Two men may take the same vehicle over the same course, in the same time, with all conditions identical, and one may use 50 per cent. more petrol than the other and at the same time boil the cooling water. The man who covers the course with a low petrol consumption and without overheating his motor will have the truer sport.

There are a few points which, while perfectly obvious to the practised *châuffeur*, are not necessarily self-evident. Perhaps the most important of all rules in the operation of petrol cars is this: Never allow your engine to run at a higher speed than necessary to do the desired work. This is the rule that, if carried out conscientiously, results in the saving of fuel, water, and the reduction of wear and tear to a minimum. The rule explicitly covers the handling of the engine controlling devices, and implicitly the handling of the gear changes. It seems very do-utiful, remarks Mr. A. L. Clough in the "Horseless Age," if any better arrangement could be devised than a foot-operated throttle, which is automatically closed to the position of minimum speed by a spring. In the use of the throttle it could be opened only just wide enough to give the gas necessary to do the work, and it is remarkable how much flexibility may be demonstrated to exist in a petrol machine by careful use of the throttle, if coupled with correct spark position.

In the control of the spark lies the opportunity for the exercise of much judgment, and there are very few who can regulate the ignition properly to secure the best economy by

hand. An automatic device is very likely to become generally adopted in the near future to perform this function. Passable results can be obtained in ordinary practice by advancing the spark for a given throttle position as long as an increase of speed is obtained thereby, and nearly up to the point where the motor begins to show the results of an early spark in the sound or the "feel" of its operation. The sound of the exhaust is some indication of the correctness of the spark position, a very loud and prolonged exhaust being indicative of a late spark and a very light exhaust, coupled with a tendency to "pound," being a symptom of early ignition.

It should be obvious to every motorist that when the engine slows down under hard work on a hill, the ignition should be set at a later point than when the car is speeding freely on the level.

In the use of the change gear, the ordinarily accepted rule is to run as much as possible on the highest gear, in order that the engine and the gear train may make as few turns as possible in a given distance traversed, and thus a saving be effected in fuel, water, and wear and tear. Here should be mentioned what is probably the most important consideration in the running

the clutch is thrown in the motion of the vehicle is arrested with a severe and sudden jerk, which is hard for the mechanism of the machine and distressing to the passengers. Of course, if the engine begins to slow down unduly upon the second speed it will be necessary to resort to the third or lowest speed. What has been said in regard to the use of gears refers only to their use when the maximum of economy in fuel, water, and battery is sought after. If the greatest speed over a given course is the desideratum, the high gear should be relinquished when the engine has slowed down to such a point that the car is travelling at a speed no higher than it would run on the next lower speed, with the engine operating at full power. If one is trying to cover a hilly course in the minimum time there is opportunity for the display of considerable judgment in the throwing in of the different gears at the most advantageous moments. Everyone hopes that the time will come when there will be no changes of gear necessary in the use of a petrol vehicle, owing to the greatly improved flexibility of the engine and greatly increased "ability" of the vehicle which the future may afford.

In driving down hill there is opportunity for good judgment.

Sir Charles Forbes on his 30-h.p. Gobron-Brillie Car.

of a petrol motor-car—the taking advantage as fully as possible of the momentum of the vehicle. The rule might perhaps read: Never let your engine lose its speed when hard work is to be required of it, for if a motor is allowed to slow down too much when hard work is immediately ahead of it, it will only "pick up" with the utmost difficulty, if at all. A great many short though quite steep hills may be taken on the highest gear, if they are "charged" vigorously by running with full power over the level space at the bottom and thereby obtaining a powerful momentum. If the hill be so long or so steep that it cannot be taken on the high gear, a strong attack upon the grade with full power on may carry the vehicle well up toward the summit and require the use of a lower gear for only a short distance. One should stick to the highest gear until the motor slows well down and shows signs of commencing to "labour," and then the change should be made to the next lower gear as nearly instantaneously as possible, so as to lose as little of the momentum of the vehicle as may be.

One often sees motorists change from a high gear to a low gear without speeding the engine up, the result being that when

One should try both brakes very frequently in the course of a run to demonstrate that they are in working order. Neither should one forget that there is a third natural brake on every petrol carriage, namely, the motor. One can always reduce the speed of the vehicle to a low point by putting in the lowest gear and cutting off the gas from the engine by means of the throttle pedal or lever; the car will then hardly exceed a few miles an hour in speed under any conditions. If then the ignition current is cut off by means of a switch, the engine will act most powerfully as a brake and will take one safely down severe grades. If one comes to the crest of a long hill, down which an exhilarating coast is expected, it is a good opportunity to give the faithful motor a rest, and one may throw out the clutch, cut off the ignition current, and allow the motor to stop. This will save fuel and give the cool breezes an opportunity to play through the radiators, and perhaps keep the water from boiling. When the bottom of the hill is near at hand the current should be switched on and the clutch gradually applied, thus starting the motor. The only objection to this practice is that it is somewhat wearing on clutches.

A handy little wrinkle to remember is that one can start a petrol car without having to turn the handle, if the vehicle has been left standing upon a hill of sufficient grade so that the car will start of its own accord when the brake is released. All one has to do is to turn on the petrol, switch on the spark, release the brake, and after the car has gained some headway throw in the clutch.

Every action connected with the control of a motor vehicle should be capable of being carried out without the intervention of the higher or reasoning faculties of the brain. In any

CONTINENTAL NOTES.

By "AUTOMAN."

THE Nice fortnight is over and has fizzled out ignominiously. Nothing could have been more unfortunate or in worse judgment than the proceedings of those in high authority. After having lost their heads completely and put a veto on the mile and kilometre races on the asphalt path of the Promenade des Anglais, at Nice, and allowing a good many of the competitors to withdraw and turn towards home, they added ridicule to

The "Concours au Bidon" (see last issue.)

M. Leon Serpollet on his new Racer.

The New Corniche Road from Cannes to St. Raphael.

The "Concours au Bidon"—Measuring the Petrol.

SNAPSHOTS AT NICE.

given emergency the response of the nerves and muscles which are to perform the act that is called for must be as certain and inevitable as the act of winking when a motion is made before the face. An operator who thoroughly understands his car in theory and practice, and who is conversant with the mode of operation of a petrol motor, if he has naturally a cool head and enough of the sporting instinct to make him take pride in the results achieved, will, when he has had an adequate amount of practice, be likely to become a good and safe driver of a motor-car.

their already unwise decision by going back on it and authorising the competition at the last minute under the condition that it should be run between five o'clock and half-past seven in the morning, and that there should not be a living soul on the road. I am at a loss to understand by what reasoning these two decisions were arrived at, and the results were amusing in the highest degree. At 4.30 a.m. the Promenade des Anglais was guarded by 300 soldiers with fixed bayonets and about as many police. Georges Prade and Hunziker, the timekeeper who replaced

Tampier, ran great risk of being arrested, and had to take refuge in the timekeepers' tent; whilst two ladies, who had the temerity to land on the shore from a boat, were bundled back into their barque at the bayonet's point—no doubt to prove to them that the sea, with all its dangers, was a fool to an automobile mile race on an asphalt track. If the cars had been infernal machines, no greater precautions could have been taken.

HERE, however, comes in the absurdity of the whole thing; for no sooner had the racing begun than all precautions fell to the ground, and with one common consent everybody invaded the Promenade des Anglais and crowded round, just as they do in every race. The Prefet himself was one of the worst offenders, and all question of law and order was absolutely forgotten and neglected. The officials seemed quite surprised that the cars could not go faster than they did.

SERPOLLET was the hero of the day, and won for the third and last time the Rothschild Cup, which is a challenge for the flying kilometre for two-seated cars, weighing from 650 to 1,000 kilos. Serpollet's time was 29.19 sec., as against his last year's time of 29.80 sec., and his speed was 123 kilometres 300 metres per hour (about 76½ miles). It is said that he was running carefully on account of the many warnings that he had received; but I should think for my own part that, if he was running carefully, it was to make sure of being able to keep the challenge cup and not have a breakdown, which would have put it out of his reach. M. Serpollet has run his last race, at least so it is said. I have heard him say several times that he would run no more after Nice, but there is no knowing what temptation he may have in the future. The steam cars had certainly the best of the flying kilometre. Le Blon was second on a Gardner-Serpollet, and then came a Mercedes, and after that Mors and Mercedes followed each other in almost regular order.

THE second Rothschild Cup for internal combustion motors was a victory for the Mercedes, Hieronymus, who drove the new 60-h.p. car belonging to Mr. G. Higginbotham, being the winner in 31.76 sec. He was followed by Werner, Braun, and Degrais; but none of the times were equal to Serpollet's in the first cup tests.

IN the mile race with the standing start the Mercedes were again successful, beating not only the Mors but also Serpollet. In the light car section, Baras had his own way on a Darracq, and had no competitors. In the motor-cycles, a Griffon, ridden by Genty, broke the record, attaining a speed equal to 101 kilometres 695 metres per hour. After the competitions were over, some trial records took place, and Braun, on a Mercedes, managed to do the flying kilometre in 30.79 sec., thus beating all the times as far as regards the petrol cars.

LAST Saturday was a great day on the Littoral. It was the inauguration of the new Corniche Road from Cannes to St. Raphael. This road has been built through the efforts of M. Abel Baillif, the President of the Touring Club of France, and it fringes the edge of the Mediterranean on those lovely shores, where the blood-red rocks make such a handsome contrast with the blue sky and sea. The Touring Club of France subscribed very large sums towards the building of this road, and it has been marked from one end to the other by signals denoting the dangers. Seats have also been placed at every point of vantage commanding the best views. The inauguration took place in the presence of M. Maruejous, Minister of Public Works, who was accompanied by the Deputy for the Department, the Prefets of the Var and the Alpes Maritimes, and also representatives of the Minister of the Interior. The whole party, with hundreds of interested spectators, formed a procession in motor-cars to open the road, which is certainly one of the most picturesque that can be conceived.

THE preparations for the Paris-Madrid race are going on steadily. It was feared at one time that the Turbie accident would, perhaps, put an end to all racing, but better counsels have prevailed, and although all sorts of people are supposed to have

prophesied the suppression of the great international race, every day brings forth a new official denial from someone or other.

FLOODS of ink are flowing on the subject of the unfortunate accident, and the most curious and extraordinary errors, blunders, and stories are appearing in the press and going the rounds of automobile circles. One of the leading automobile manufacturers, who has been trying to get a cheap advertisement for his own cars out of the sad event, informs the public that had Count Zborowski's car had a foot accelerator, the accident would not have happened. He blames the well-known Mercedes device on the steering wheel, by which the gas is shut off or opened. But here he drops into an egregious blunder, for he says that if you turn the steering wheel round, you turn the gas off or on as the case may be. This, of course, is not the case, as the regulation of the throttle valve is accomplished by changing the position of the hand lever on the steering wheel in relation to the steering wheel itself. This is accomplished by an internal screw inside the steering pillar, and as the lever is moved to the right or to the left, this screw raises or depresses the connecting link which works the slide in the carburettor. The turning of the hand wheel does not affect this in any way.

A Gillet-Forest Car outside the A.C.F., Paris.

IN connection with the Circuit National which is being organised by the Belgian Automobile Club, the following programme has been arranged: May 9th, leave Brussels for Antwerp; May 10th, Antwerp-Liege; May 11th, Liege-Arlon; May 12th, Arlon-Namur; May 13th, hill-climbing and speed trials at Namur; May 14th, Namur-Brussels.

THE entry lists for the Circuit des Ardennes, to be held on the 20th and 21st June next, under the auspices of the A.C.B. and A.C.N.L., are now open. There is to be a special train leaving the northern station, Brussels, on the 19th June at 6 p.m. for Arlon, where the start of the first day's racing will take place. It will leave Arlon on the evening of the 20th at 6 o'clock for Bastogne, and will return to Brussels on the evening of the 21st after the races. Meals will be served in the train, and those who wish to have places reserved should apply to the A.C.B. without delay.

I SAW Mr. Gray Dinsmore's 60-h.p. Mercedes at the A.C.F. the other day. There is not very much difference from last year's model. The new clutch has evidently been abandoned and replaced by the old one, and the same seems to be the case with the speed-changing lever, which has the old lateral motion. There is, however, a thumb spring at the top of the lever which opens or closes the path into the reverse motion, so that instead of having to use both hands, as in the 1902 model, the thumb of the right hand replaces the left hand for reversing. The throttle valve is on the wing principle instead of the slide system.

MOTOR-CYCLING NEWS.

A COMPACT form of float-feed spray carburettor is used in conjunction with the new bicycle motor recently introduced by Messrs. De Dion, Bouton and Company. It will be seen that the float chamber contains a cylindrical cork float having a round hole pierced through its centre. At the lower end of this hole hangs, by means of a loose wire loop, a conical stop, so that as the float rises on the petrol the conical stop closes the orifice through which petrol enters from below. A spring observed just below this cone holds in position a wire gauze screen for the exclusion of impurities that might otherwise enter with the petrol along the pipe C. A tube fixed to the top of the chamber projects down-

wards about halfway into the hole in the centre of the float, its upper end terminating in a small hole in the upper chamber in the centre of the mixture valve actuated by an external lever. The operation is as follows:—The suction of the motor draws upwards from the float chamber a charge of petrol which is sprayed through the fine hole and mingles with the air drawn in at A into the upper chamber, the two combining to form the explosive mixture which is drawn through the induction pipe to the engine. The carburettor is made in brass, and is provided with a throttle valve to regulate the supply of gas. The lower portion of the casting unscrews, enabling the cork float to be removed, if necessary.

THIS week we select for illustration the new belt-driven motor bicycle known as the Star Griffon, which the Star Cycle Company, Limited, have lately introduced into this country. The air-cooled engine develops 2-h.p., and is built into the frame in a vertical position, just forward of the bottom bracket. An exhaust valve lifter is fitted, while the mixture is furnished by a Longuemare carburettor. The machine, which is of French manufacture, has a specially strong frame, and is equipped with rim brakes to both wheels. A large tank is fitted into the frame, affording large petrol and lubricating capacity.

THE General Steam Navigation Company will convey the motor-bicycles of members of the A.C.G.B.I. free of charge, when accompanied by the owners, to Bordeaux, Ostend, Amsterdam, Hamburg, Rotterdam, Havre, and Edinburgh.

The "Star-Griffon" Motor-Bicycle.

ON Thursday last week, on the Canning Town cycle track, the motor-cycle match between H. Martin and F. W. Chase postponed from the previous Saturday owing to the wet, was concluded in favour of Martin, who won three events to his opponent's one. The Saturday event was a one mile standing start race, and Martin won by three lengths in 1 min. 34 2-5 sec. On Thursday, the 9th inst., Chase started well by taking the one mile flying start by a wheel's length, in 1 min. 20 sec., but the two races over five miles from standing and flying starts respectively were each won by Martin, who rode the first in 6 min. 55 4-5 sec., and the second in 6 min. 32 1-5 sec.

HEREWITH we illustrate the "Simplex" belt fastener which has lately been put on the market by Messrs. R. Herwin and Company, of Plumstead. It is specially designed for use with

Lincona and other wedged-shape motor-cycle belts, and, as will be seen, it consists of two steel clips bridged by a steel pivoted link. The clips attach to the ends of the belt by bolts.

THE Motor Cycle Advisory Committee of the A.C.G.B.I. has suggested a scheme for a new body to control motor cycling. This would be known as the Auto-Cycle Club, and would work under the control of the parent organisation, the committee being formed of ten members of the Automobile Club and eight representatives of the private members. For the latter the annual subscription is to be a guinea; for members of the A.C.G.B.I. five shillings. The objects of the new body will be the general advance of motor cycling and to obtain legal advice for the members through the Motor Union.

MOTOR-CYCLE races were included in the Easter Monday sports meetings on the Putney and Canning Town tracks. The Putney event was a five miles scratch race for machines up to 3-h.p., and for which Mr. Mark Mayhew had presented a silver cup. The race was won by T. E. Newman, who took the lead soon after the start, winning easily by three laps; F. E. Baker was second, being about two laps in front of H. Wingfield (third).

At Canning Town there were two motor-cycle events—a ten-mile scratch race and a five-mile handicap. H. Martin, on a 2½-h.p. Excelsior, won the former in 12 min. 56 4-5 sec. The five mile handicap resulted as follows:—H. Martin (10 sec. start) 1; T. H. Tessier (25

sec.), 2; H. Collier (25 sec.), 3. Time, 6 min. 33 1-5 sec.

A SPECIAL feature of motor-cycle races is to be made by the Midland Cycling and Athletic Club at its sports meeting on May 9th at Villa Park, Aston Lower Grounds, Birmingham. The programme includes a five mile handicap; a mile time trial for machines not exceeding 3-h.p.; and a three miles handicap for machines not exceeding 2-h.p.

HERE AND THERE.

THE Manchester Automobile Club is holding a run to Chester to-day (Saturday).

MESSRS. MITCHELL, TOMS AND CO., of Chard, are adopting a motor vehicle for the conveyance of goods.

MESSRS. W. J. TRIMBLE AND SONS, Church Street, Dungannon, Ireland, are stocking petrol and becoming agents for motor-cars.

CLEANING requisites are an essential feature of the equipment of any well-ordered motor house. Mr. A. Dunhill makes a

A Necessary Operation.

feature of their supply, his outfit including everything down to the minutest detail.

THE bursting of the tyres of a car belonging to Mr. J. Plunkett, D.L., while touring in Co. Donegal, has caused the smashing of the vehicle and serious injury to the occupants.

A GARAGE and repairing establishment has just been opened in Cavendish Street, Birkenhead, by Mr. J. W. Fairbrother, who will keep a stock of petrol and spare parts.

THE Prime Minister has been the guest of Mr. Percy Wyndham at Clouds, near Salisbury, during Easter. He proceeded thither from town by motor-car.

THE Duke of Ratibor, president of the German Automobile Union, has issued a public warning to German automobilists cautioning them against fast and furious driving.

THE Automobile Club of Florence is organising a hill-climbing competition from Pontassieve to Consuma, in the Apennines, for the 11th June.

IT is announced from Paris that Messrs. Panhard and Levassor have served notice of action against the agents of the Mercedes cars for infringement of carburettor and differential brake patents.

AMONG the wild statements made at a meeting of London cabmen on Peckham Rye on Sunday was one to the effect that an American firm is about to place 3,000 motor cabs on the streets of the metropolis.

THE Lebaudy navigable balloon made two ascents at Moisson on Saturday, with excellent results. In the first attempt a journey of 19 kilometres at a height of 200 metres was made in 30 minutes.

WHILE visiting, on Bank Holiday, the George Hotel, Crawley—one of the most comfortable inns on the Southern roads—we saw a new 12-h.p. Darracq in the garage. This, we learnt, belonged to Mr. Ivan Caryll, and had been purchased at the late Agricultural Hall Motor Show.

THE annual meeting of the Automobile Club of Denmark was held on the 1st inst. The Club, which has now ninety-three

members, is organising a tour from Copenhagen to Stockholm in connection with the exhibition to be held in the latter city next month. In July or August an automobile tour of Denmark is to be held.

SPEAKING at the annual meeting of the Newcastle branch of the Lord's Day Observance Society, Alderman Sir W. H. Stephenson, the Mayor of Newcastle-on-Tyne, said that he recently spent a Sunday in a small Yorkshire town. Looking from the window of the hotel where he was staying, he counted no fewer than 12 motor-cars, all ranged in file in front of the main entrance to the hotel.

A MOTOR-CAR accident, in which several persons had marvellous escapes, has occurred on Pokesdown Hill, near Bournemouth. A motor-car was conveying some eight passengers from Bournemouth to Christchurch, and when descending Pokesdown Hill at a good pace one of the front wheels suddenly collapsed, the car swerved into a bank, and, turning over on its side, threw the passengers out with some force. The driver had the worst fall, the passengers escaping with only a severe fright and a shaking. The motor-car immediately caught fire and was much damaged. Members of the ambulance brigade were passing at the time, but fortunately none of the passengers required assistance.

DAYTONA, a popular seaside resort in Florida, has, as one of its attractions, a stretch of flat sandy beach several miles long, on which a three days' "Automobile Tournament" was held on March 26th, 27th, and 28th. On the first day Mr. Alexander Winton, on his "Bullet," covered a mile in fifty-six seconds; Mr. H. T. Thomas, on an Oldsmobile, in 1 min. 8 4-5 sec., and Mr. Oscar Hedstrom, on an "Indian" motor-bicycle, in 1 min. 15 2-5 sec. On the third day Winton covered the mile in 52 1-5 sec., and 10 miles in 10 min. 26 sec. Thomas' best time was 1 min. 6 3-5 sec., and Hedstrom's 1 min. 3 1-5 sec. The Oldsmobile used in the trials was a curious-looking vehicle, consisting merely of the chassis with a single seat projecting behind the rear axle, the steering wheel being almost vertical.

PARTICULARS of early motor-cars continue to reach us from all parts of the world. The accompanying illustration shows a steam car built by a doctor at Racine, Wis., U.S.A., in 1872. As

An Early American Steam Car.

the "Horseless Age" remarks, pneumatic tyres were then unknown; nor was oil available as a fuel to produce power, coal having to be employed. A steam car was also built in 1880 by Mr. William Siefker, of Seymour, Ind. It ran on 30-inch cast-iron wheels, had a 14-inch fire-tube boiler, 36 inches high, with twenty-one 1 1/2-inch flues and two separate engines, one for each wheel. Coal was used as fuel, and a speed of ten to twelve miles an hour was attained on good roads.

At the Red Hill Farm, Edgware, Mr. J. J. Walker has accommodation for a score of motor-cars.

On Saturday next, the 25th inst., the Western and Eastern Sections of the Scottish Automobile Club will hold a run to Callander.

THE ALGERIAN AUTOMOBILE CLUB, which held a series of kilometre tests recently at Ain-Taya, is organising a 100 kilometre road race for the 1st May.

MANY private owners of motor-cars lent their vehicles to the Dutch Government for temporary service during the recent railway strike in that country.

THE exports of automobiles and parts from the United States during February last showed a marked increase, the figures being £12,644 as against £6,900 in February, 1902.

THE Paris municipal authorities have invited designs for a motor dust-cart, and will, it is reported, place an order for thirty vehicles with the firm whose design is selected.

THE sparking plug "discovery" is now attracting attention in the United States, and several devices providing an external gap in the high-tension circuit have already made their appearance, one of them being shown in the accompanying illustration. As will be seen, it is intended to be fixed on the dashboard, and consists of a cylindrical wooden box A with a wood cover B, provided with a glass window C. Within the box are arranged

two binding screws D, to one of which a wire from the coil is attached; while from the other runs a wire to the plug. Copper tips E, with sharp points, are soldered to the ends of the wires which project through the binding screws. The distance between the points of these tips can be adjusted, as will be apparent from the drawings. The device is made by Mr. Chas. D. Shain, of 70, Murray Street, New York.

THE Cantor Lectures, commencing on the 27th inst. at the Society of Arts, will deal with mechanical road carriages. Mr. W. W. Beaumont is the lecturer.

CATCHING sight of a motor-car at Aden, a camel uttered a piercing cry and went mad on the spot. "Just like a Surrey policeman," observed the motorist, cynically (if the *Globe* is to be believed), as he eyed the gesticulating animal.

AN electric motor-car, capable of attaining a speed of eighteen miles an hour, with a full complement of ladders for salvage purposes, has this week come into use experimentally in connection with the Vienna fire brigade.

MR. W. G. ROBINSON has just opened a garage and engineering works immediately behind the Imperial Hotel, Claremont Park, Blackpool, a seaside resort which is not too well supplied with establishments of the kind.

THE Paris Municipal Council has accepted the design for a motor watering cart sent in by a well-known firm of automobile builders. The vehicle is expected to be ready to commence operations this summer.

MULLINER'S, LIMITED, has been registered with a capital of £50,000 to acquire the business of coach-builders, engineers, etc.,

lately carried on in Birmingham by the Mulliner-Wigley Company, Limited, and to develop the same.

AN automobile tour from Chicago to Mammoth Cave, Ky., has been arranged by the Chicago Automobile Club. Forty cars have already been entered. The start will be made on June 25 and the return on July 7. The round trip will be about 1,500 miles in length.

THE word "automobile" appeared for the first time in the United States Post Office Appropriation Bill adopted at the last session of Congress. It was a Senate interpolation into the section providing for "horse hire (or automobiles) allowance 750,000 dollars (£150,000) in the city free delivery service."

MESSRS. JOSEPH COCKSHOOT AND COMPANY, LIMITED, the agents for the Stanley steam cars and Northern petrol vehicles, have opened large new premises at Great Northern Arches, Deansgate, Manchester. They include a show-room, repair shops, and an extensive garage.

A GLANCE at some of the catalogues issued by firms supplying motorists with equipment is interesting. Messrs. Gamage's catalogue, for example, gives illustrations of ear guards, with springs for securely fixing around the head, a simple little device illustrative of the care with which they seek to make their motor department comprehensive even of the minutest detail.

CONCERNING our recent note on the subject of little refinements, we are reminded that two of the items we referred to already receive attention on the Duryea cars, for a screw is fitted in the bottom of the carburettor which can be taken out in a few seconds by the fingers and the float-chamber emptied. The strainer to the petrol tank serves also as a gauge, and the exact amount of petrol in the tank can be seen at a glance.

MESSRS. JOHN CHILD MEREDITH, LIMITED, have sent us a sample of a spark intensifier they have just brought out. It is used as a terminal on the end of the high tension wire, making a very secure end. To attach the device the insulation is cut away about $\frac{1}{4}$ inch from end of wire. The wire is then inserted on the terminal so that the end of the cable comes within $\frac{1}{8}$ inch of the adjustment screw, when the latter is screwed down to its full extent. The length of the jump can then be adjusted by the adjustment screw.

MR. G. H. OLLIVER'S notes on the management of the Serpollet Steam Car, published by Messrs. Hiffe and Sons, Limited, have now reached a second edition. Seeing that it is little more than a year ago when the first edition was issued, the popularity of the work is already assured. It deals with the various features of the car, and also gives some accurate diagrams of the various connections, which should be much appreciated by the novice. Miscellaneous hints, and a series of questions which are likely to occur in the management of the steam car, conclude a very useful book.

A DETACHABLE roller chain for motor cars is the latest production of the Whitney Manufacturing Company, of Hartford, Conn. The chain is detachable at any point and can be taken apart quickly and without difficulty when it is necessary to repair or shorten it. Only the outer plates on one side of the chain are riveted over. The side plates on the other side are simply placed on the rivets. They cannot, however, turn on the latter, because of the irregular shape of the holes, while they are held in position by thin plates of spring steel in which is a slit to allow them to be forced on the rivets.

FROM Messrs. Charles Letts and Company we have received a copy of the Autocar Log Book, with patent self-opening memo tablet and a £500 accident insurance policy. It also contains a list of towns in Great Britain, with leading hotels, motor-car repairers, petrol agents, etc.; a handy distance tablet, showing the number of miles of the principal suburban and other places from London; some selected routes; hills, with their approximate gradients, and a number of pages for notes of engagements, cost of maintenance, registration of mileage, etc. A page of first-aid hints in emergencies is not the least useful one in the little volume, which is neatly and strongly bound, and of a convenient size for the pocket.

The Motor-Car Exhibition at the Agricultural Hall.

(CONCLUDING NOTICE.)

Fig. 62.—Chassis of the Clement Car.

With the present issue we conclude our review of the recent Motor-Car Exhibition at the Agricultural Hall, London, an event to which the trade had been looking forward as the Business Show of the year. Such it undoubtedly proved, and even within the last few days orders have been received by several firms as the culmination of inquiries first made at the Exhibition.

The BRITISH AUTOMOBILE COMMERCIAL SYNDICATE, as will be seen from the general views we have published, had a most elaborately-decorated stand, which caught the eye in whatever part of the Large Hall one might be. Not only were the decorations of the stand attractive, but the cars

jackets are all cast in one piece with the cylinders, so that there are no water joints. The crank case is of aluminium and the bottom part is removable by six nuts; on this being detached the whole of the crank shaft, together with the piston, can be taken out. There is an opening for each pair of cylinders, which can be removed by undoing two nuts, permitting inspection inside the crank case. The engine (Fig. 65) is fitted with a centrifugal governor running in oil. The governor throttles the admission at 750 revolutions by actuating on three different points—it closes the

Fig. 63.—The Clement Carburettor.

Fig. 64.—The Clement Cardan Shaft and Live Axle.

exhibited thereon were finished in a most sumptuous style. Only two makes of vehicles were shown—the Clement and Panhard. For the 1903 season the Clement cars are made in the following sizes:—9-h.p., two-cylinder; 12-h.p., four-cylinder; and 18-h.p., four-cylinder. The dimensions of the cylinders are: 9-h.p., 85 by 120 mm., developing 11-h.p.; 12-h.p., 75 by 120 mm.; and 18-h.p., 85 by 120 mm., the latter giving 24-h.p. The cranks are forged in one piece and are supported on two outer bearings and one centre bearing. To obtain access to the pistons, the cylinders are removable in pairs by undoing six nuts. The water

inlet to the engine, the air port to the carburettor, and also the carburettor jet. The admission valves are mechanically operated off the same cam shaft as the exhaust valves. To remove the valves all that is necessary is to remove a large nut placed on top of the cylinder. The ignition is by magneto, driven from the engine by spur gearing. The shaft carrying the contact breakers runs horizontally over the top of the cylinders, and is worked by a vertical shaft placed directly in front of the engine, and actuated through worm gearing. The carburettor (Fig. 63) is of the float-fed type; it is automatically regulated by the governor, and in accordance

with the speed of the engine, the jet, the inlet, and the air port are automatically opened or closed. The four-cylinder cars are fitted with a combined water-tank and cooler of the honeycomb type, with fan. The pump is driven direct from the motor by spur gearing. Forced lubrication is adopted, this being effected by water pressure, the lubrication immediately ceasing when the engine is stopped. In the two-cylinder car there are

Fig. 65. —The Clement Four-Cylinder Motor.

three speeds forward and reverse, while the four-cylinder car has four speeds forward and reverse. The change-speed gear on its first three speed is actuated on the ordinary Daimler sliding system. On the top speed the motor drives direct on to the back axle. The transmission from the change-speed gear to the back axle is by a longitudinal shaft and bevel wheel, the shaft being contained the whole of its length in a phosphor bronze bearing. Instead of having a universal joint at each end, it has only at one end, near the change speed box, a large single ball joint. A pedal controls a specially-constructed metallic band-brake on the main shaft, carrying contact shoes. The brakes actuated by the side lever are of the expanding type, working inside drums on the back wheels. The rear axle is contained in a hollow sleeve, and is held on four anti-friction bearings. Having now briefly dealt with the leading mechanical features, reference may be made to the special bodies fitted to some of the cars exhibited. We first inspected an 18-h.p., fitted with a double phaeton body and canopy, of a type which is to be known as the "Roi d'Angleterre." The principal feature is the novel way of entering to the rear seats. The left front seat is so connected by sliding joints to the front half of the lower panel, which acts as a door to the rear seats, that by pulling open the latter the front seat is swung round. Another 18-h.p. Clement was fitted with a "Vanderbilt" limousine body to seat four inside, all the windows being arranged to let down. An ingeniously-arranged collapsible and sliding front seat for a mechanic is provided in case the owner should desire to drive himself. Passing now to the Panhard cars, of these several 10-h.p. and 15-h.p. vehicles were shown, one of the latter fitted with a Roi d'Espagne phaeton body, being particularly noticeable. Altogether the bodies shown on this stand, not only as regards the wood and aluminium parts, but also the upholstery and painting, were of the highest class, and reflect much credit on Messrs. Rothschild and Fils, the designers and builders. A specimen wheel, fitted with Corbet's side-slip preventer, was also shown on this stand. This takes the form of a steel disc or washer, the perimeter of which is the size of the motor tyre; it is fixed flat to the side of the rear wheels, and is secured by springs hooked to a ring permanently fixed to the spokes. The perimeter of the disc is fitted with a series of hard steel

segments, one of which bears on the road at a time. Should the wheel show any tendency to skid, the steel segments take a grip on the road, preventing the car from slewing round. We understand that the device has been tested on greasy asphalt and wood paving road with marked success. Mr. G. BRAULIK, who has taken up the English agency for the "Protos" motors and cars, exhibited a tonneau of this make fitted with a 8½-h.p. single-cylinder motor. The engine is fixed in the front part of the car on springs connected to the frame, and the power is transmitted through a clutch to the gear box and thence to the hind axle by means of a single centrally-located chain. Two speeds forward and a reverse are available, the arrangement of the change-speed gear being the same as that illustrated in connection with our report of the 1902 Exhibition at the Agricultural Hall. One of the chief features of the car is the arrangement of the hind axle; this is attached to springs connected to a frame which is in turn connected to the main frame-work at one point by a universal joint. This arrangement affords ample protection from breakages, due to heavy strains suddenly thrown on the rear axle by rough roads or impediments. Mr. Braulik also exhibited specimens of the "Protos" 3½-h.p. and 6-h.p. single-cylinder motors and 12-h.p. double-cylinder engine, the latter being equipped with a governor acting on the gas admission. A new three-wheeled light two-seated car, which is shortly to be placed on the market, was also shown on this stand in an incomplete condition. This will have two speeds and be driven by a 3½-h.p. engine placed in a vertical position under the seat.

The INTERNATIONAL MOTOR CAR COMPANY, LIMITED, had an exhibit which was the best this concern has so far made, not only as regards size, but in the quality of car displayed, the new "Portland" vehicles being a decided advance on the "Charette." In general design they follow the now usually accepted lines. The 6-h.p. car has a tubular steel frame with Aster motor, the latter being fitted with a governor acting on the inlet, and a gear-driven pump. Three speeds forward and reverse are controlled by one lever, the drive on the top speed being direct to a live axle. The rear part of the tonneau body is made separately, so that it can be quickly detached when desired. The 12-h.p. "Portland" car is built on similar lines, but is equipped with an Aster 12-h.p. double-cylinder governed engine. The 24-h.p. car of the same make is recommended to those who desire a vehicle that is speedy and an excellent hill-climber. Space will not allow of a detailed description; suffice to say that it is fitted with an Aster four-cylinder motor, four speeds forward and reverse, gear and chain drive, angle steel frame, electric ignition, latest pattern radiators, and a tonneau body with bucket seats in front. As to the speed qualities of the 24-h.p. car, we may mention that it is being sold with a guarantee as to its capability of attaining a rate of fifty miles per hour. The International Company, which has been fortunate enough to secure a number of 10-h.p. Panhard cars for early delivery, had also one of these vehicles on their stand.

In addition to their capital display in the Arcade, Messrs. GAMAGE staged their voiturette on a stand in the Main Hall. This is a two-seated car, with a 6-h.p. De Dion engine located in front, being placed somewhat low down on a secondary tubular frame, which is carried by the main

Fig. 66. —The Benz 10-h.p. Limousine. (See issue April 4th, page 91.)

frame, also tubular. A pedal-operated friction clutch connects the engine to the gear box. There are three speeds forward and reverse, operated by a side lever, the drive on the top speed being direct by shaft to a live axle of large dimensions. The wheel base is notably longer than usual. There are ample brakes, and in general outline the Gamage voiturette as a pleasing appearance.

An interesting display of the latest types of Mors and Renault cars was made by the ROADWAY AUTOCAR COMPANY, LIMITED. Of the 18-h.p. Mors vehicle a chassis was staged, but as we published an illustrated description of this so recently as our issue of the 21st ult., no further reference is necessary. Another Mors car exhibited was a 15-h.p. double tonneau with special Boulogne body. Passing to the Renault cars, we first

Fig. 67.—Section of Inlet Valve 10-h.p. Renault Car.

inspected the chassis of the latest 10-h.p. car. This has a tubular steel frame, in the fore part of which is located a two-cylinder motor of Messrs. Renault's own construction. The cylinders are 100 mm. diameter by 120 mm. stroke. The engine runs normally at 1,200 revolutions per minute, but can be retarded to 300, or accelerated to 1,400. The governor is adapted to act on the gas admission, while a new departure is the fitting of a device, actuated by a small hand lever, by means of which the lift of the suction

The valve stem moves in a guide carried by bridge pieces from the ring forming the valve seating. The lower end of the valve spring, instead of bearing on the shoulder on the guide, is supported by the inturned lip of the inverted cup referred to above. In the position shown in Fig. 67, the valve is acting normally; by depressing the outer end of the rocking lever the inverted cup is caused to rise in the guides formed for it in the bell-shaped chamber, carrying the lower coil of the valve spring with it, thus compressing the spring. The suction of the piston not being able to

Fig. 68.—Section of Renault Four-Cylinder Motor, showing Lubricating Arrangements.

open the valve to the normal owing to the stiffer spring, the incoming charge is, consequently, reduced in volume, the explosion is weakened, and the speed of the engine reduced proportionately to the movement of the rocking lever. Three speeds forward and a reverse are provided, the change-speed gear being so arranged that, on the top speed, the power is transmitted direct, the countershaft being entirely out of action. The cardan system of transmission is of course still retained, but we noticed that a new type of expanding brake has been adopted. We noticed, too, that the rear

Fig. 69.—View of Motor of Renault 14-h.p. Car.

[La France Automobile.]

inlet valve can be varied and the speed of the engine, consequently, regulated as desired. A section of the arrangement is shown in Fig. 67, from which it will be seen that the inlet valve is enclosed in a bell-shaped chamber within the valve box, the bell enclosing in its turn an inverted cup attached as to its upper end to a lifting rod connected to one end of a rocking lever.

springs are not rigidly attached to the axle, but are attached to clips free to move round the latter, distance rods connected to the top and bottom of the differential case being provided, to keep the axle in position. Coming now to the Renault 14-h.p. car (Fig. 69), the feature of this is that the four-cylinder motor has mechanically-operated inlet valves located

on the same side as the exhaust valves, all being actuated by one cam shaft. As regards the gear and transmission, this is on the same lines as those adopted in the 10-h.p. car. Particular attention has been devoted to the question of the lubrication of the motor, the arrangement shown in Fig. 68 having been adopted. The oil is delivered from a Dubrule lubricator through a copper tube to the oil wells *c* formed in the upper part of the crank chamber. Thence it feeds by gravity to the crankshaft bearings in the ends of the chamber *h f*, from which a portion of it runs into circular catch fillets *i* formed on the outer and inner faces of the crank discs. Centrifugal force causes the oil to flow from these fillets through passages *j* to the crank pin bearings. The surplus oil drops from these and the crankshaft bearings into the crank chamber, and is thence directed on to the pistons and walls of the cylinders by the splashing from the connecting rod heads, which also throw the oil into the wells *b* (Fig. 68). Thence the lubricant attains the central oil well *d*, from which it drops into the cap serving the central bearing of the crankshaft *g*. In this way both gravity and centrifugal force play their part in the lubrication of the motor.

There are a number of special features in the Crouan cars which formed the exhibit of Messrs. C. ISLER AND COMPANY. The frame is of the steel tube type, strongly braced, and carrying in the forepart a double-cylinder horizontal motor (Fig. 71), the cylinders being placed opposite to each other with a central crank chamber, thereby greatly minimising vibration. The engine, nominally rated as developing 6-h.p., works up to $7\frac{1}{2}$ h.p.; the diameter of the cylinders being 96 mm. by 98 mm. stroke. A novel feature of the motor is that it is fitted with a self-governing ignition gear. The wiper of the commutator is self-governed by a spring, which allows it, when running fast, to rise, or when running slow to fall, and so come in contact with different segments of the contact-making surface. The mixture is

Fig. 70.—The Crouan Car.

supplied by a special carburettor patented in 1898, claimed to be similar in effect to the Krebs carburettor now being used on the Panhard car. In this the quality of the mixture is automatically adjusted to the speed of the engine. The water circulation for the cooling of the motor is on the thermo-siphon system. Coming now to the transmission, five speeds forward and a reverse are provided, these being all actuated by a single lever on the steering pillar, which also, by a vertical movement, controls the admission of gas, thereby regulating the motor from 150 to 900 revolutions per minute. The engine is connected to the gear box through a cone clutch, the power then being conveyed to the rear live axle by a universally-jointed shaft and bevel gear. Inclined wheel steering, hand and foot double-acting brakes, automatic lubrication to all parts from dashboard, are other features of the Crouan car, which is fitted with a tonneau body, built of sheet metal, on a wooden frame.

The BRITISH GERMAIN MOTOR-CAR COMPANY, LIMITED, made a big display of the well-known Germain cars, the exhibit comprising examples of the $7\frac{1}{2}$ -h.p. and 15-h.p. types. The small size is provided with two-cylinder engines, 95 mm. diameter by 130 mm. stroke, the normal speed being 800 revolutions per minute. Four speeds forward and reverse are provided, the countershaft being connected to the rear road wheels by side chains. Of the $7\frac{1}{2}$ -h.p. cars, a tonneau and a coupé (Fig. 73) were displayed. The two larger cars have four-cylinder engines governed on the inlet and covered by the latest type of square bonnet with the radiator in the front opening. One of the new features in the 15-h.p. Germain cars is the carburettor (Fig. 72) or rather an addition to the carburettor by means of which the quality of the mixture is automatically varied according to the speed of the motor. Referring to the sectional view of the apparatus (Fig. 72) it will be seen that it comprises a cylindrical body *B* covered by the screw-down cap *A*.

Within the cylinder *B*, and made an easy sliding fit therein, is a piston or plunger *C*, held up in the upper part of the cylinder by the coiled spring *D*. The suction stroke of the motor piston reduces the pressure within the cylinder *B* below that of the surrounding atmosphere, and the latter then takes effect upon the upper surface of the plunger *C* by means of the orifice *a*

Fig. 71.—Part Sectional, Elevation and Plan of Crouan Motor.

in the cap *A*. If the pressure of the air on the top of the plunger *C* is sufficient to compress the spring *D*, the piston is thereby lowered until the triangular orifice *E* in its wall more or less coincides with the square orifice *F* formed in the side of the cylinder *B*, allowing more or less pure air to

Fig. 72.—Section of Germain Automatic Carburettor.

enter *B* in proportion to the increased speed of the engine. The number, form, and dimensions of these orifices, as well as the strength of the spring, are determined by experiment, and regulated once for all so that at low speed no portion of the orifices coincide, and the carburation of the air is controlled and varied only by the size of the petrol jet and the usual hand-controlled air admission. On the other hand, when the engine is running at high speed the plunger *C* descends more or less, admitting air through the apertures *E* and *F*, coinciding in quantities calculated to give

the best possible mixture at every speed. It will be easily understood that this apparatus will give the best results with motors which are governed either on the exhaust or by throttled induction. By means of a thread cut on the cylindrical body B, the present apparatus can be attached to existing carburettors on Germain cars, it taking the place of the usual mushroom pulveriser. The four cylinders are cast in pairs, and the inlet

Fig. 73.—The Germain 7 1/2 h.p. Petrol Coupe.

valves are so arranged that they may be operated either mechanically or automatically by suction in the usual way. The cam shaft, which is outside the crank chamber, is fitted with additional cams, actuating two rocking levers set on a short shaft, one of which is connected by a tension rod to a lever set across the top of the inlet valve dome. This lever bears upon the spiral spring and the upper end of the inlet valve stem, which is carried through to accommodate it. When it is desired to run the motor with the inlet valve working automatically, the valve depressing levers are pushed down, and the tension rods slipped off their ends. The dimensions of the cylinders of the 15-h.p. motor are the same as those given above for the 7 1/2-h.p. They are fitted with both tube and electric ignition, but the Eisemann magneto system can be applied if desired. To meet the demand for a "popular" light car, the Germain Company have secured the agency for a little French vehicle to which they have given the name "Staughton." The engine is of the single-cylinder, vertical type, developing 8-h.p. Three forward speeds and reverse are provided, the transmission being by means of an universally-jointed shaft and bevel gear to the rear live axle. Another noticeable exhibit of this firm was the 15-h.p. heavy transport lorry. It weighs about 2 1/2 tons, and is capable of carrying a load of over 5 tons. It is fitted with four-cylinder motor, four speeds forward and reverse, and is chain driven. Still another exhibit of interest on the Germain stand

contact breaker by worm gear. We noticed also that the governor was entirely enclosed. Altogether the British Germain Company's exhibit was of a most interesting character.

The "Holcar" is the name of a new petrol car designed by Mr. Holroyd Smith, the chassis of which was shown in the Gallery on the stand of the UNITED KINGDOM INVENTIONS SYNDICATE, LIMITED. To begin with the frame, this is of channel steel, in the fore part of which is set the engine. The latter comprises four independent cylinders placed diagonally at right angles to each other, two on each side of the car, and all four driving on to one common crank-shaft. The dimensions are 4 1/2 in. bore by 5 in. stroke. Both the induction and the exhaust valves are mechanically operated. The cooling water can automatically circulate, but is assisted by a special direct-driven pump, so coupled that the water is distributed equally to all four cylinders, instead of to each in succession. Electric ignition is employed, a Bowden wire being employed for advancing and retarding. The sparking plugs, commutator, carburettor, pump, and the valves are all easily accessible, while ample provision is made for lubrication. The speed of the motor is controlled by a special automatic governing device acting on the admission, subject to variation between 200 and 1,500 revolutions per minute (the normal speed being 900 revolutions) at the will of the driver, by means of Bowden wire. A pulverising carburettor is fitted, the air mixture of which may be regulated by the controlling lever by means of a Bowden wire. The power of the engine is conveyed to the gear-box through a friction clutch, which acts in two directions: in the forward position it drives the gear-box, whilst in the rearward position it acts as a brake, independent of the engine, the intermediate position giving a free engine. Two speeds, forward and a reverse, controlled by one lever, are provided, the gear vessels being always in mesh, the requisite pair being brought into action by means of clutches. From the gear-box

Fig. 74a.—The Scheele Electrical Convertible Brougham. (See issue Mar 28 page 73)

the power is conveyed to the rear live axle by cardan shaft and bevel gear. Special band-brakes are fitted to drums on the rear wheels, the inside of the drums being provided with ratchets. In engagement with each is a lifting pawl operated by Bowden wire mechanism, and which acts as a sprag, preventing the car running backwards, except when the pawl is lifted out of engagement with the ratchets. Another feature is an adjustable steering pillar, the column carrying the steering hand-wheel being pivotally mounted in such a way that its inclination to the rider may be adjusted by means of a thumb screw, and the hand wheel even pushed right forward to enable the driver to mount on either side of the vehicle. The handles for setting the ignition, adjusting the carburettor and regulating the speed of the engine are mounted on the steering column. Reference should also be made to the use of three silencers—an intermediate one for each pair of cylinders, and a large one at the rear from which the exhaust gases emerge through a row of nipped outlets. In order to ensure effective cooling of the cylinders Mr. Holroyd Smith holds the opinion that not only must a large surface be exposed to the air, but this surface must also be exposed to a large or wide current of air. This is obtained by a large number of small and thin gauge copper tubes which run entirely around the bonnet and in an arch over the dashboard. As will be seen, the "Holcar" comprises a number of new features, and we look forward to see it in the forthcoming trials. On the same stand was shown a rotary steam-motor of extremely compact form, instantaneously reversible, specially suitable for launches, yachts, etc., and the U.K.I. dry cell for ignition purposes.

In the Gallery the Steam Car Industries Company showed a 12-h.p. magnet car, a Boyer "Universal" car, on familiar lines, and a Stirling dogcart, fitted with a 5-h.p. Panhard engine. These vehicles attracted considerable attention throughout the week of the Exhibition.

Fig. 74.—The Germain 40-h.p. Motor.

was a 40-h.p. engine (Fig. 74) intended for a racer at present being built for the Paris-Madrid contest. The four cylinders are separate, being made of steel, with brass water jackets. The cylinder diameter is 140 mm. by 160 mm. stroke, the engine being capable of developing 57-h.p. The inlet valves are mechanically operated, they being on the same side as the exhaust valves, all being actuated off one cam shaft, which also drives the

Mr. D. CITROEN, who has hitherto only been identified with the Minerva motors, specimens of which were shown on his stand, has now taken up motor-cars, which, however, he intends to supply solely through the trade. No less than three types of cars new to the English market were shown on his stand. The first of these—the Tony Huber—was briefly referred to in our report of the Paris Salon. We first inspected a 12-h.p. chassis, the frame constructed of wood with steel fitch plates, being a fine piece of work. This is fitted with a four-cylinder motor; the cylinders, which are built separately and 112 mm. diameter by 140 mm. stroke, are constructed of steel. The inlet valves are mechanically-operated, and located

Fig. 75.—Chassis of Tony Huber 12-h.p. Car.

| D. Gear box. | O. Speed change lever. |
| E. Differential. | P. Brake lever. |

on the same side of the engine as the exhaust valves. There is thus only one half-speed countershaft, driven by outside spur gearing. Cylindrical water jackets of brass are fitted in such a way that they can be removed and replaced in a few minutes for cleaning purposes. All the bearings are fitted with phosphor bronze liners. The engine speed, which is normally 1,000 revolutions per minute, is regulated by a centrifugal governor acting upon a piston valve which automatically regulates the quality of the mixture, by admitting more air to the cylinder at high speed. The ignition is by induced high tension spark; but magneto ignition may be substituted if desired. The valves are readily accessible. In this car the power is conveyed to the rear axle by a longitudinal shaft and bevel gearing. Four speeds and one reverse are available. A direct drive on the high speed is obtained by throwing the usual gear carrier K (which slides on the square portion H of the central shaft) (Fig. 76) into mesh with a short shaft R, which takes the drive of the motor and which drives the countershaft by means of a pinion D. The object of this reversal of the usual arrangement is to obtain special rigidity for the rear end of the central shaft which is subjected to the strain of the brake pulley W, and which supports the driving block A of the propeller shaft. The latter runs in two long phosphor bronze bearings, and the differential shaft runs on substantial bearings of the same material six inches long. On the rear axle the usual stay rods supporting the differential box are dispensed with, their place being taken by a tubular extension of this box round the propeller shaft, which transmits the radial effort set up by the driving bevel pinion to the end of the propeller shaft. Sight-feed lubrication to all the bearings is provided. A second type of Tony Huber chassis is fitted with chain drive and a four-cylinder motor with the cylinders (98 mm. by 140 mm.) cast in pairs. The engine runs at a normal speed of 800 revolutions per minute; a feature of the water jackets is the fitting of detachable plugs, which can be likened to nothing else than stoppers of lager beer bottles. In this engine the inlet valves are of the ordinary suction type. The change gear is similar to the one referred to above, an independent differential countershaft being fitted. This is designed to be attached to the main frame, and is connected by a universal joint to the gear box. In all other

Fig. 76.—Section of Tony Huber Change-Speed Gear and Cardan Shaft.

respects the 16-h.p. car is similar to the 12-h.p. type. We now come to the Henriod motors and cars, which for the English market are to be known as the "Pandora." Of these, a 7-h.p. chassis was shown, this comprising a single-cylinder engine (100 mm. by 120 mm.). The main feature of the chassis consists of the grouping of three forward speed gears, reverse gear, differential, live axle, three brakes, and hubs, into one simple mechanism to be attached by springs to the rear portion of the main frame, one longitudinal shaft transmitting the power from the clutch to the rear axle. Specimens of the Pandora 12-h.p. (100 mm. by 130 mm.) and 18-h.p. (120 mm. and 130 mm.) double-cylinder motors were also displayed, these having

suction inlet valves and a governor acting on a throttle on the admission. Still another new car to the English market is the "Vesta." This is fitted with a vertical engine developing 7-h.p., the cylinder, which is 100 mm. diameter by 120 mm. stroke, having mechanical-operated inlet valves. This is a chain-driven car, two speeds and a reverse being provided. Altogether, Mr. Citroen has now a well-chosen selection of cars to offer.

Messrs. PETO AND RADFORD's reputation in connection with ignition work was well sustained. A new accumulator was shown in which the electrolyte is a paste of sulphate of lead, which enables the cells to give off a current of increased voltage, while the splashing associated with diluted acid is, of course, obviated. The Bergmann magneto ignition was also demonstrated, and a condenser exhibited for fitting to the outside of the coil through which the high tension current is passed before reaching the sparking plug, and by which it is immediately intensified. It is claimed that its action is similar to that of a Leyden jar. Messrs. Peto and Radford had on view a new terminal clip, designed for attaching to wires without the necessity for soldering or brazing. The ebonite sleeve which secures the wire, by making the metal terminal grip it, forms both a support and an insulator—a most important point on high tension wires, where it is advisable to expose as little bare metal as possible. Vulcan auto-tremblers, for converting non-trembling coils into high-speed trembling coils, dynamos, sparking plugs, and other electrical accessories, completed a most interesting display.

Seddon's motor-tyre was shown by the BRITISH MOTOR TYRE SYNDICATE, Limited. This special form of tyre constitutes a combined tyre and tube; a reserve tube being, however, inserted for inflation in case of accident.

Clincher-Michelin tyres were shown by the NORTH BRITISH RUBBER COMPANY, Limited, and also by the Maison Talbot, samples of various sizes, as well as a goodly selection of repairing requisites being displayed.

An interesting display was made by the BEGBIE MANUFACTURING COMPANY, whose exhibit comprised components of considerable interest. A

Fig. 77.—The Anglo-American Co.'s Electrical Brougham. (See Issue April 4th, p. 98.)

large show of Aster engines was made, including the new 16-h.p. four-cylinder type, running at 950 revolutions. This is fitted with a wipe contact breaker, comprising a spring-controlled roller, which rolls against the inner periphery of the outer case. It is insulated, and has phosphor bronze introduced at various points of its circumference to correspond with the number of cylinders employed. The Aster three-speed gear (recently illustrated in the *Journal*) and reverse, with differential and clutch, was shown in the 6½-h.p. and 12-h.p. sizes. Other exhibits included new patterns of Begbie-Audin radiator, electric lighting sets, tanks, bonnets, etc.

Messrs. STEINER AND Co. had a bold show of lamps and horns in which some good ideas had been introduced. This firm is favourably known in the trade. Several ingenious devices were shown, the workmanship and finish being equally good.

Messrs. VAN RADEN AND Co. showed a good selection of their standard articles, including induction coils, testing appliances, and charging dynamos.

M. LOUIS GIANOLI showed the well-known G. L. induction coils with, also without, the Charpentier trembler. Voltmeters, amperemeters, switch handles, etc., were also on exhibition at this stand.

The EAST LONDON RUBBER COMPANY made a good display, and, in addition to the "Kerry" motor-bicycle, to which reference has previously been made in the *Journal*, had some trailers and a fore-carriage on view. The latter is of good design and finish, and should be found acceptable to motor-cyclists. The company also had a general assortment of motor-car fittings and accessories, such as castings, carburettors, radiators, gears, sparking plugs, and lamps.

A good show of electrical vehicles was made by Messrs. SHIPPEY BROS., including a "doctor's car," built with high wheels, for hard wear, as suggested by Mr. Rudyard Kipling. The "Toledo" steam runabout

was also shown, the display being completed by a thoroughly representative collection of Diamond tyres in all sizes, as well as good specimens of British-made artillery wheels fitted with Diamond tyres, and a set of non-skidding herring-bone pneumatic tyres.

Mr. JULIUS MATTON, representing the Cologne Accumulator Works, showed some accumulators for ignition purposes, in which the plates are isolated by means of perforated and undulated ebonite sheets. The ebonite covers of the boxes have soft rubber borders, which, although not pitched, do not allow the acid to spill.

Messrs. LACOSTE showed a new rotary contact breaker, and some good types of trembler coils for multiple cylinder engines. Stop-watches, voltmeters, motor horns, flexible tubes, accumulators, etc., were also shown.

All motorists interested in steam cars must have been impressed with the exhibit made by the CREMORNE MOTOR MANUFACTURING COMPANY, formerly known as the Creek Street Engineering Company. These included the "Johnston" liquid fuel burner, which is capable of burning paraffin, having a flash point of from 74 deg. to 150 deg. On the stand was shown a Locomobile fitted with this burner. In such a case an evaporative efficiency of 15.6 lbs. of water per lb. of paraffin oil has been obtained with the burner, which can be easily and quickly started, and in connection with which there is no back-firing.

In a recent issue we gave an illustration of the new belt chain for motor cycles, introduced by the COVENTRY CHAIN COMPANY, who showed this speciality on their stand, as well as a good selection of their automobile chains.

Lubricating oils for all kinds of cars were shown by PRICE'S PATENT CANDLE COMPANY, LIMITED, whose "Belmoline" solidified oil, Motorine, and Rangraphine have long been known to motorists. They have just brought out an "Oleogene" in two kinds, a "D." for De Dion engines, and a "P." variety for Panhard cars. This firm's motor lubricants are free

this name is that the inflated portion is entirely outside the rim, thus ensuring flexibility, resilience, and, consequently, speed. The Goodyear endless solid tyre is securely fastened in several places to the rim by cross bolts, thus obviating creeping.

Messrs. J. C. STATTER AND Co. showed a sparking plug *de luxe*, which combines a sparking plug and spark intensifier in one piece. The sparking plug proper is of a familiar type. To that part remote from the engine cylinder is fitted an air-tight metal case containing the sparking cap. The spark passes between the two metal points inside this case, which are visible through glass provided for this purpose. While the plug is in use the distance between the points can be adjusted by means of an insulated metal-headed screw. A good type of acetylene lamp was also shown by this firm, who drew special attention to their jack *de luxe*, which closes down to such short length that it will be found useful in connection with voiturettes, while when opened out fully it is useful for large cars. These advantages are secured by two concentric steel screws, one working within the other, and although only weighing 4½ lbs., this jack will lift 30 cwt. Its height when closed is 9 in., and when opened 1 ft. 8 in.

A new exhibitor at the Show was Mr. A. H. SHARPE, of Lincoln, who drew attention to his patent belt fastener, a very secure way of fastening any belts. An automatic grease-discharging belt was also shown, these two novelties attracting considerable attention from practical visitors.

Among the new tyres shown were the PETER'S PATENT UNION TYRE, which, although made of solid rubber, is claimed to possess almost as much resilience as pneumatic tyres. It is moulded in one solid piece, with endless wire bands at the foot of the rubber. The special method of fixing consists in a rim, one side of which is removable by means of a rod and lifting screw. When unscrewed a few times, this allows the movable part of the rim to come off. The tyre can then be easily put on from the side, the rim replaced, and the whole fixed in position by tightening the screw

Fig. 78.—The Motor Vehicle and Engineering Co.'s 10-h.p. Grand Car. (See issue March 28th, page 72.)

from oxidising or gumming tendency, while their Rangoon Jelly is an effective medium for the protection of plated parts, and bright metal generally, from the corrosive action of wet and the atmosphere.

THE DOWSING RADIANT HEAT COMPANY, LIMITED, had an effective collection of their radiators for warming motor cars as well as private apartments. These can be worked from any electrical supply main, provided that the heat lamps are fitted for the correct voltage, and the connecting wires are of sufficient size to carry the current. With four such lamps one of these radiators is calculated to consume one unit of electricity per hour, such being found of sufficient capacity for warming a room 12 ft. square, and of the ordinary height.

Messrs. MOEBIUS AND SON had a very effective show of oils, including motor oil for air-cooled engines, motor grease for gear cases, and burning oils for motor lamps. Several good lubricants were shown by Messrs. STERN BROS., whose high flash point oils for Serpollet and other steam cars are well known. Among their specialities is "Austosternol," with a flash point of over 400° F. for light cars. This is a pure hydrocarbon non-corrosive free from vegetable and animal matters, and is specially intended for air-cooled motors. The "Evertrusty" dust-proof lubricator was shown with the anti-vibration safety cap recently introduced. It has the advantage of being unable to come off, even at the highest speeds. These are supplied in two types, one for screw compression and the other for spring pressure. Mr. P. LAWRENCE had a stand whereon was displayed a large selection of lubricating oils, greases, belting, etc., for automobiles.

The DUNLOP COMPANY had representation with a selection of their tyres, including the set on which the Hon. C. S. Rolls made his great record at Welbeck. Good styles of clothing were also to be seen on their stand.

Goodyear motor tyres were shown by the GOODYEAR TYRE AND RUBBER COMPANY. The principle of the double tube pneumatic tyre of

already mentioned. The creeping of the tyre is thus effectually prevented, and the fact that replacement can be so easily made should warrant motorists giving attention to this special tyre. Considerable interest was evinced in the BUCKINGHAM PATENT STEEL-FACED RUBBER tyre. This was recently referred to in our columns, and is a formation of rubber and steel, securing durability as well as resilience. Side slips, it is claimed, are prevented by this tyre, whilst the engine is saved a great deal of the unnecessary jolting and vibration. The tyre is made in sizes to take felloes from 2 in. to 4½ in. in width.

On the stand of the CLARENDON MOTOR CAR AND BICYCLE COMPANY was shown an example of the Clarendon motor-bicycle, of which an illustrated notice was published in our issue of the 13th December last. The engine is carried in a special frame vertically mid-way between the two wheels. The engine crank-shaft has an outer bearing running on balls outside the driving pulley, this preventing any cross strain on the engine crank-shaft. The whole machine appears to be a very good example of British motor-bicycle design. This company are about to bring out a machine on similar lines but fitted with a 3-h.p. engine with mechanical inlet valve.

The "Pebok" motor-cycle was shown by the PEBOK MOTOR-CYCLE COMPANY. The engine is placed in a vertical position in a loop frame forward of the bottom bracket. It can be easily detached by unscrewing two bolts. A float-feed carburettor is fitted, the ignition being by coil and accumulator. The transmission is effected by a three-ply V section belt. The length of wiring is notably short, thus avoiding the risks of short circuiting. Longuemare carburettors, Basse-Michel coils, voltmeters, contact breakers, lubricators, etc., were also comprised in the display of the Pebok Company.

A selection of seamless patent steel and copper engineers' oil feeders, oil filters, etc., was shown by T. F. BRAIME and Co., Limited.

Among the carriage-building firms who are now devoting much attention to motor-cars is Messrs. LAURIE AND MARNER, who had a large and varied display. First we noticed a 15-h.p. Mors, with a handsomely finished six-seated tonneau body and canopy. The Cudell cars were represented by a 12-h.p. tonneau (Fig. 79). This follows the standard lines of gear-driven cars, the power being supplied by a two-cylinder vertical engine, with a governor acting on the inlet. The cylinders are 110 mm. diameter by 110 mm. stroke, the speed varying from 300 to 1,400 revolutions

Fig. 79.—The Cudell 12-h.p. Car.

per minute. The engine transmits its power through a friction clutch to the speed gear, which gives four speeds forward and one reverse motion. On the highest speed the power is transmitted direct, none of the pinions in the gear box being in motion. Still another make of petrol car to be found on this stand was the Vincke-Halcrow. These are built in accordance with the generally-adopted practice of gear-driven cars, being fitted with a 9-h.p. single-cylinder engine, three speeds and reverse, the latter being controlled by a lever on the steering column. An 8-h.p. Linon car and a 9-h.p. Mathieu tonneau also found places on this stand, while finally we may refer to the display of Pegamoid cloths and paints as well as to the tourist maps mounted on Pegamoid.

Motor-cycles constituted an attractive display made by Messrs. BAYLISS, THOMAS AND CO. Their Excelsior machines are well known, the framework being of special strength and design. Massive front forks are provided, these being carried right up to the top ball race. The drive is by means of a Lincona belt. Surface or Longuemare spray carburetors are fitted. Lubrication is effected by sight feed pump supplied from the tank placed in the angle between the diagonal tube and back forks. The 2-h.p. machine is specially intended for use in districts where the hills are of ordinary contour, while the 2½-h.p. motor-bicycle can be ridden practically anywhere and will be found very serviceable in connection with a trailer—a capital specimen of which was on view.

Bevel, differential and driving gears, as well as a large selection of patterns for castings, etc., formed the main features of a good display by the MOTOGEAR ENGINEERING CO., whose workmanship revealed a good finish. The collection of exhibits included machines cut spur, bevel, mitre, and spiral wheels, special raw hide and fibre pinions for noiseless power transmission, etc.

A good assortment of motors for car or launch work was exhibited by Mr. E. A. McLAUCHLAN, a special feature of his display being a double-cylinder slow speed oil engine of 10-h.p. This is fitted with electrical ignition. The exhaust gases are led through a chamber which forms the vaporizer and silencer combined. After the engine has run about ten minutes this chamber becomes sufficiently warm to vaporise paraffin oil. A set of 6-h.p. compound condensing steam engines was also on view, as well as Dickenson's Morette already described in our columns. This has a 1½-h.p. motor, and on a level road can attain a speed equivalent to the legal limit.

The COLLIER TWIN TYRE COMPANY, Limited, had a bold display of their well-known tyres shown on large-size artillery wheels, ranging from

40 in. to 28 in. in diameter. Inner tubes were also conspicuous on the stand, including the set which went successfully through the recent 4,000 miles tyre tests. There were also shown a set of tyres which had travelled 14,000 miles on a car weighing two tons when loaded, without having to be removed from the rim.

Stamped steel barrels were conspicuous on the stand of Messrs. J. F. PEASE AND CO., LIMITED. These are specially designed for conveying and storing oil, etc., saving loss by leakage, evaporation, or absorption. The Telo tyre and wheel was also on their stand, this being a combination of an unpuncturable tyre and rim of novel form and a wheel stamped out of steel. It is claimed to have the resiliency of the pneumatic tyre and all the advantages of a solid tyre. Should the inner tube burst the carriage can be run to its destination on the solid or outer tyre.

The ANDERSON MOTOR TYRE COMPANY, LIMITED, attracted attention to their system of repairing motor tires. They have a vulcanising plant in London and base their charges for repair work on the amount of new rubber introduced.

MESSRS. FRANK F. WELLINGTON, Limited, who have secured the sole agency for the "Brooke" cars, exhibited two of the standard 14-h.p. vehicles with tonneau bodies (Fig. 80), the details of which have already been described in the *Journal*. The engine is of the three-cylinder type, fitted with Estcourt induction valves and natural circulation cooler. Transmission is on the "Brooke" system, the change-speed gear being operated by chains. All the wheels are of equal diameter, and shod with 870 by 90 mm. pneumatic tyres. Interest in Messrs. Wellington's stand was chiefly

centred in the new "Brooke" light car, which was shown for the first time at any Exhibition. The motor is of very interesting design, comprising three vertical cylinders, the actual h.p. being 15. It is fitted with mechanically-actuated induction valves, the whole of the valves being in one line and worked from a single cam shaft. The governor acts on the throttle, but is actuated by the suction created by the motor, it being claimed for this arrangement that it obviates all objectionable sharp cutting-out action. The cylinders are 3½ in. diameter by 4½ in. stroke, the normal speed being 900 revolutions per minute. The water-cooling is effected by pump circulation and induced draught created by fan blades formed in the fly-wheel on the Mercedes principle. The engine is set in the reverse way to that adopted in the standard "Brooke" car, the transmission arrangement being similar to that adopted in the Panhard type, i.e., through a friction clutch, gear-box, differential shaft, and side chains.

Fig. 80.—The Brooke 14-h.p. Standard Car.

Three speeds forward and a reverse are provided, the change gear being of the sliding-pinon type, with a direct drive to the bevel wheel driving the differential countershaft on the top speed. The clutch and brake pedals are mounted so that they are operated by being pushed forward by the foot, while the levers controlling the change-speed gear and side-brakes are fitted so as to be drawn towards the driver. The car, which has a wheel base of 7 ft. 3 in., and, with two-seated racing body, weighs 13 cwt., has every appearance of being a flier.

Outwardly the little electrical car (Fig. 81) exhibited by Messrs. PRITCHETT AND GOLD, Ltd., closely resembles a petrol-driven vehicle. The car, which has accommodation for two passengers, has been designed to meet the demands of owners of country houses who have an electric lighting plant. The frame is constructed of steel tubing. The motor is a four-pole series wound, specially designed for running for long periods without attention, it being self-lubricating; it is rated at 4-h.p., and is mounted at about the centre of the frame, driving the rear axle through bevel gearing. The controller is arranged to give four speeds forward, ranging from 5 to 18 miles per hour, and two speeds backward. The battery cells are divided, one portion being carried in the front of the car under a bonnet, the other being under the seat; this arrangement gives equal distribution of weight over the chassis. The battery consists of forty cells of Messrs. Pritchett and Gold's traction type, and is of 120 ampere-hour capacity, this being sufficient to give a run of forty miles on a single charge, over roads of good and level surface. The controller is of the usual drum type, giving a series-parallel control, and is operated by a hand lever placed at the side of the seat.

Among the journals represented at the show was *Le Chauffeur*, the oldest technical journal in France, MADAME LOCKERT presiding over its fortunes with characteristic energy and tactfulness.

The PNEUMATIC ENDURANCE WHEEL was shown, and its special points attracted considerable attention. This is adaptable to any form of motor vehicle. It consists of an outer tyre or wheel tread of plain steel, or channel with or without rubber tread, in sizes adapted to the service required, and two inner steel rims, one overlaying the pneumatic tube and rigidly connected with the tyre or tread and central hub, the other supporting the pneumatic tube and connected by spokes with the two segments of the outer hub. The upper steel rim is a part of the central or rigid wheel; the inner and supporting rim is an integral part of the suspended or movable wheel. There is a pneumatic tube in the wheel, the outer tyre or wheel tread being rigidly connected with the overlying steel rim and the central hub section. The notion is already familiar enough in the United States, where it has already been adopted by a number of motorists.

A neat display of the little 4½-h.p. and 5½-h.p. two-seated Swift cars was to be seen on the stand of the SWIFT MOTOR COMPANY, as also a specimen of the ingenious combined change-speed and driving gear employed. A full description of the general arrangement adopted was given in our report of the 1902 Agricultural Hall Exhibition; a few slight modifications and improvements have been introduced, the main one being the provision of a reverse motion. No differential gear of the usual type is fitted, ratchet

controlling each pair. Special attention has been paid to the lubrication of the main bearings and in the new car artillery type wood wheels have been adopted.

M. HENRI CORMERY exhibited on the stand of Madame Lockert an interesting two-cycle bicycle motor, the arrangement being such that the mixture is drawn from the carburettor into the crank chamber, and thence forced by the movement of the piston in its downward stroke into the

Fig. 81.—The Pritchett and Gold Electrical Car.

combustion chamber above. An illustrated description of the Cormery motor was given in the *Journal* of February 23rd, 1901.

The HYDE PARK MOTOR COMPANY had a large and varied show, including a new spark intensifier for motors, oils, greases, horns, etc. They also found a place for the Wilkinson patent non-slipping tyre covers for motor-cars. These are made of strong backing, with an outside covering of thick rubber and insertion cloth perforated so as to admit rows of rubber through the perforations through the body of the thick rubber, thus knitting together the rubber above and below the insertion. In this way the cleavage is prevented, the cloth separating the wires, which are pricked through the covers from back to front in the form of staples, finishing flush with the face of the tread.

At the stand of the CARLTON MOTOR COMPANY the great novelty was a patent combined carburettor and inlet valve, which will give equal results with petrol, paraffin, and alcohol. It secures a positive measured feed, and is an atomiser and vaporiser at the point of admission. The company also exhibited their new 2½-h.p. and 3-h.p. vertical engines for motor-bicycles, in which the large and long bearings are a conspicuous feature. New exhaust lifters, and a new method of fixing the engines in the frame were also shown. The Carlton motor-bicycle is controlled by one thumb lever; there is automatic oiling throughout, and it is fitted up for the use of petrol or paraffin. A large display of engine castings, accessories, stampings, forgings, etc., completed a useful display.

A new electrical car to the English market is the "Gallia," of which one having a highly-finished landaulette body was shown on the stand of the BUCKINGHAM PALACE GARAGE COMPANY.

The New Orleans cars have always been a very popular type in this country, and, judging from the latest models, they should continue to stand high in public favour. The NEW ORLEANS MOTOR COMPANY only showed two cars—a 9-h.p. double-cylinder vehicle with tonneau body and three speeds and reverse, and a 15-h.p. four-cylinder car having four speeds forward in addition to one backward motion. One of the chief improvements in this vehicle is in the change-speed gear, the change from one speed to another being made without having to pass through the other two speeds. It also gives a direct drive on the top speed with the countershaft entirely disengaged.

The back live axle is of an entirely new design, the wheels revolving on a stationary axle similar to that in a chain-driven car. The radiator is of the new honeycomb type, reducing the amount of water carried by 50 per cent. The frame is similar to that of the 1902 four-cylinder car, but has been lengthened to allow an increase of 10 ins. in the wheel base.

The Coventry Eagle motor-bicycle, attracted attention on the stand of the COVENTRY EAGLE CYCLE COMPANY, Limited, whose trailers and fore-carriages are of equally good repute.

Fig. 82.—The Swift 6-h.p. Car.

clutches being provided fitted to each driving wheel on the ends of the live axle to allow either wheel to over-run the other in turning corners. The novelty on the stand was the chassis of the latest Swift voiturette (Fig. 82). This has the same gear as the 5½-h.p. car, but is fitted with a 6-h.p. De Dion engine. The tubular frame is of special construction, being suspended on full elliptic springs over the rear axle as well as above the front axle; tubular distance rods connect the back axle with the frame. The hubs of the rear wheels are provided with two hand brakes each, separate pedals

CORRESPONDENCE.

THE SPARKING PLUG "DISCOVERY."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Allow me to thank Mr. Estcourt for his correction. I must admit that I had not experimented with petrol vapour myself, but was given to understand by one whom I considered an authority, that the vapour was lighter than air, hence my suggestion. My mistake, however, has probably been productive of good in that it has drawn from Mr. Estcourt a very lucid demonstration of an experiment verifying his statement, which may be useful to others besides myself. Petrol being a comparatively new substance, no mention of it is to be found in scientific books. Any information, therefore, on the subject which may be imparted in your valuable columns cannot but be welcomed by all who have to use it, many of whom may not have time or opportunity of experimenting themselves.—Yours truly,

W. W. HARDWICKE.

[Pressure on our space has prevented the publication of several interesting letters. These will appear next week.—ED. M. C. J.]

GLASGOW TO LONDON TRIAL.

FOR the Glasgow to London trial, to be held on May 13th and 14th, under the auspices of the Western Section of the Scottish Automobile Club, the following entries have been received:—

Entrant.	Description.	B.H.P.	Approximate Weight Unladen. Cwts.	Tyres.
Delahaye Chief Depot	Delahaye	12	16	Michelin
Captain H. H. P. Deasy	Rochet & Schneider	22	20	Pneumatic
Henry B. Hemmons	Argyll	9	12	Ditto
Hozier Engineering Co., Ltd.	Ditto	10	13	Ditto
Ditto	12-h.p. Argyll	16	17	Ditto
C. Jarrott	24-h.p. De Dietrich	30	19½	Ditto
Wm. H. Kingsbury	Elswick	14	17	Dunlop
Lanchester Engine Co., Ltd.	10-h.p. Lanchester	18	19	Michelin
Ditto	Ditto	18	19	Ditto
Miss Dorothy E. Levitt	Gladiator	12	15½	Dunlop
Mann and Overton's, Ltd.	12-h.p. Georges Richard.	13	13	Pneumatic

Glasgow Motor-Car Co.	Peugeot	6½	6½	Continental
Farman Automobile Co., Ltd.	F.A.C. tonneau	24	20	Pneumatics

* Nominal.

CLAIMS FOR DAMAGES.

BEFORE Mr. Justice Grantham, in the King's Bench Division, a case was tried on April 6th, W. J. Shelly, a market gardener, suing Fuller, Smith and Co., Ltd., to recover damages for injuries sustained by two ponies belonging to him, owing to the alleged negligence of the defendants' servants while driving a motor-van. Mr. Justice Grantham, in giving judgment, said it was well known that people owned motor-vehicles which were often driven by contract. The contracts varied in form, and it was very important to see what the particular contract in each case provided. In the present case Messrs. Thornycroft and Co. built the defendants' van, and the latter, knowing the nature of this traffic, made a special contract with them, under which Messrs. Thornycroft took the whole responsibility of driving the van, for which the defendants agreed to pay them the sum of 45s. a week, of which sum 35s. were paid by Messrs. Thornycroft to the driver. In these circumstances it seemed to him that the driver was not the servant of the defendants, and his judgment must be for them. A stay of execution was granted.

At the Marylebone County Court Mrs. Clark has brought an action against Mr. Arthur Wilson, of Hull, and of Grosvenor Place, London, to recover £50, the value of a horse and the cost of damage done to a cab by the defendant's motor-car, which collided with it on December 19th last. After retiring for half an hour the jury could not agree, and counsel agreed to accept a verdict of the majority, which resulted in the plaintiff being awarded £40 damages.

THE STORAGE OF PETROL.

THE NOTTINGHAM AUTO-CAR COMPANY have been sued at Nottingham Summons Court for an offence under the Petroleum Act. The matter, as explained by Mr. H. W. Day (of the Town Clerk's Department), was a technical one, and the prosecution was brought as a warning to users of petroleum spirit and petrol, as to what were the regulations with which they had to comply. A person was entitled to keep three gallons, providing it was in separate one-pint vessels. If he wished to keep a larger quantity the user must apply for a licence, and an inspector would call to inspect the premises whereon the stuff would be stored. Under the regulations a person might store sixty gallons, but the petrol must only be in use for the purpose specified in the regulations, and must not be resold. The defendant company were charged with selling two gallons of petrol. The maximum penalty was £20 per day. A nominal penalty was asked for. The offence was admitted, and a fine of 10s., including costs, inflicted.

POLICE TRAPS.

POLICE-CONSTABLE WAGHORN is winning renown on the East Sussex roads as having a keen eye for motorists.

SOME of the Metropolitan police amused themselves on Bank Holiday by capturing motorists in the West End of London. At the Queen's Gate, Hyde Park, a measured fifth of a mile proved a good trap, the victims including Mr. O. Stanton.

FURIOUS DRIVING CASES.

COUNT.	DEFENDANT.	ALLEGED SPEED.	RESULT.
Odiham (Hants).	W. Hobbs (driver to Mr. Lionel Phillips) Rotherwick	35 m. p. h.	50s., etc.
"	J. E. Thornycroft, Chiswick	23 m. p. h.	£2, etc.
Epsom	Dr. R. McMahon, Hammer-smith	21 m. p. h.	£1, etc.
"	H. Guillon, London, N.E.	25 m. p. h.	£1, etc.
"	J. Price, Chelsea, S.W.	19 m. p. h.	£1, etc.
Shoreham	S. Daver	32 m. p. h.	£10, etc.
"	S. Girling	34 m. p. h.	£5, etc.
"	H. E. Dennis	24 m. p. h.	£5, etc.
Kirkcaldy	C. Gaulard, Wemyss Castle	20 m. p. h.	£5, etc.

Where no alleged speed is given it is understood to be above the legal limit.

IN the case at Shoreham Mr. H. E. Dennis declared he was only travelling 15 miles an hour, and that he had a Surrey magistrate with him in the car who thought it was absurd for the police to stop him.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, APRIL 25, 1903.

[No. 216.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE opening meeting of the Lincolnshire Club was a notable function, the occasion being taken to propitiate the local surveyors off the Fens at a cheery luncheon at the Saracen's Head Hotel, Lincoln. Mr. W. Garfit, M.P., presided, and said he was in favour of doing away with the speed limit, but would greatly punish those who drove to the annoyance and danger of the public. When the House of Commons consented to the Gordon Bennett race being held in Ireland it gave the case away as to speed. Sir H. B. Bacon, Bart., also spoke, and declared in favour of numbering.

Our Roads.

CAPTAIN J. S. RUSTON, J.P., proposed the toast of the day, the "Road Surveyors," asking them to remove foreign matter from the roads, and do something to mitigate the dust nuisance. In response Mr. E. P. Hooley, the County Surveyor of Notts, said he thought Lincolnshire roads had improved wonderfully. Referring to the dust problem he said he had tried for ten years to secure a road material that would defy the weather, the greatest enemy. He found that furnace slag could be made into a splendid material that would wear well, but not absorb moisture and throw it off in the way of mud as granite would. He found that by getting the slag about eighteen hours old, the temperature was right, but he could not get manual labour to mix it, so he devised a machine that turned out tarred macadam properly saturated. The absorption tests were: granite 2.8 gallons per ton in twenty-four hours, slag 3.745, and the new material 0.278 only. He had had some down four years and it had not been touched. It was cheaper than other material, and wore longer. A trial was being made on one of the worst roads in Notts.

Official Views.

MR. W. EMBLETON FOX, J.P., responded to the toast of "The County Authorities," proposed by Captain J. A. Cole, J.P. He said that a radical alteration in the present regulations was necessary. The County Councils' Association was agreed as to the necessity of removing all limitations as to pace of motors, but there must be some means of identification, and there must be greater punishments for repeated offences. He dealt with the objections to numbering, and thought motorists would grow accustomed to their numbers. It was not worth objecting to numbers on the grounds of their appearance. As for the risk of persecution, the only persons to be feared would be the police; but what could they do with no legal limit? It would be difficult to prove common danger. Therefore the fear of persecution might be dropped. His impression was that the solution to the whole difficulty was the abolition of the speed limit, identification, the use for motorists of the ordinary law, and increase of punishment for repeated offences.

The Hotel Problem.

MR. W. REES JEFFREYS, the new Administrative Secretary to the A.C.G.B.I., proposed the toast of the Lincolnshire Club, commending it on its work and position, as well as its standing with the police. He found that police traps increased fast driving, for even considerate drivers knew it was useless to drive slowly. As a rule it was the surveyors who had brought about improvements, and he thought it good for all if the dignity of the county and district surveyors was enhanced. Some hotels could be improved as regards their attitude to automobilists. In France, automobilists were treated well, and supplies for motors were stocked. Dr. E. Cragg (Billingborough), the enthusiastic hon. sec., responded for the Club. Subsequently many of the party motored to Sleaford, where twenty cars rested while their drivers and passengers took tea at the White Hart Hotel.

Villages and the Car.

WITH the Earl of Camperdown as its moving spirit, a company has been formed for a motor-car service between Stratford-on-Avon and Brailes, a village four miles beyond Shipston-on-Stour, a distance altogether of about fourteen miles. Some months ago Lord Camperdown called a meeting at Shipston to agitate for the re-opening of a disused tramway belonging to the Great Western Railway, but the railway authorities have shown no intention of moving in the matter. Each car will hold about sixteen people, and the experiment should convince railway companies that the automobile is likely to play an important part in the traffic arrangements of the country. In some of the districts where railway enterprise is practically dormant the motor-car will revolutionise social conditions and bring prosperity to many a decaying locality.

Motors at the Meet.

AT a recent meeting of the Warwickshire Hunt the vexed question of motor-cars as a means of conveyance to the meets of the hounds was discussed, and a vote taken. It was moved by Lord Willoughby de Broke, and seconded by Lord Southampton, that the practice was undesirable; and ultimately a motion respectfully requesting ladies and gentlemen to abstain from travelling to meets of the Warwickshire Hounds on motor-cars was carried unanimously. Great diversity of opinion prevails concerning the propriety or otherwise of motor-cars being brought into the hunting field in and on the borders of the Shires, but we believe that, in the end, the automobile will be welcomed rather than tabooed.

Roads in the Monmouth District.

THE Easter tour of the Midland Club to Hereford revealed as great an improvement in the roads of that district as Mr. Hooley has observed in Lincolnshire. Mr. T. C. Aveling, the hon. sec. of the Club, testifies to the improvement of the highways in the Forest of Dean, the Wye Valley, and the Swansea area as compared with what they were four or five years ago. In fact they will compare favourably with the roads of any other

locality. About twenty-five members of the Club participated in the run, which was successful from every point of view.

"We
are
Seven."

LAST week we recorded the initial run of the Norfolk Automobile Club, which has started well and promises to do great things in the eastern counties. Below we give a photograph of the "Brooke" contingent to the meet. Mr.

and Mrs. Maudslay Brooke are on the car to the right of the picture, Mr. E. Estcourt will be recognised in the centre, and Mr. F. F. Wellington to the left. Mr. W. Chamberlin and Mr. R. Lawrence are other well-known motorists depicted in the scene.

New Motor
Works.

ON Thursday week, about twenty gentlemen sat down to a luncheon in connection with the formal opening of the Ryknield Engine Company's works at Burton-on-Trent. These are of spacious extent, replete with most modern tools,

and under the management of Mr. Bagguley, late works manager to the Locomotive Works at Stafford. The brewery interests were worthily represented by Mr. Clay, chairman of the

Numbers for All.

WHILST we have heard little of late with regard to the numbering of motor-cars, a suggestion has just been placed before the Chief Commissioner of Police for the Metropolis, who is said to be giving it his careful consideration, to place *all* trade vehicles under the obligation of displaying a descriptive number corresponding to an entry in an official register. This obligation is at present only imposed upon cabs, trams, and omnibuses, and most constables acknowledge that they get ready obedience to commands to stop or otherwise from the drivers of such vehicles, but those in charge of other vans or cars are wont to defy or argue against their authority, and thus lead to some confusion in the road. The regulations providing that cars used by way of trade shall be inscribed with the names and addresses of their owners has been regarded as ineffective in securing that obedience to authority which is so essential in the crowded streets of London. Hence the proposal to number all trade vans of whatever kind. This should prove the last straw on the back of the numbering campaign, and altogether dispel the hope of some motorists that they may be allowed to go about the country numbered as though they were some particular "lot" just delivered from the auction room.

The Contingent of Brooke Cars at the Inaugural Meet of the Norfolk Automobile Club.

board and vice-chairman of Bass's, Lord Burton, and Mr. Worthington—all enthusiastic motorists. In his speech Mr. Clay stated they were building a car with two cylinders, a steel stamped frame, a new carburettor, magneto ignition, etc. The question of expansion was mentioned, and all arrangements for this had been made, the various speakers stating that further capital would be forthcoming as required.

Amateur Repairers.

BOTH Mr. Worthington and Mr. Bagguley are fond of working the various tools, and for some time before the above works were completed, a repair shop was maintained by the company. One

midday, after the workmen had left for dinner, a broken down 3½-h.p. Benz was brought in for repair, and was wanted by the travellers for use after they had finished their lunch, so what did these two gentlemen do? They simply set about the repairs, and within one and a half hours had completed them to their own and the motorists' satisfaction. Four shilling was charged, and the amateur mechanics were very proud of their two shillings each, money earned by the sweat of their brows. The sequel is told when Mr. Worthington at a Hunt Ball afterwards met the motorist, and mutual recognition ensued.

A Scottish
Motorist's Views.

MR. H. E. MOSS, who has been entertaining the members of the Scottish Automobile Club at Middleton, Gorebridge, on the occasion of the Club's first run for the season, has strong views with regard to automobilism. He does not think the limit system can endure. Nobody can tell exactly what the rate of speed is. "I saw," he has been saying to a Press representative, "that a policeman, in the witness-box, said the other day that a car was going at the rate of '17 miles an hour.' Now, how was it possible for him to ascertain that? I quite grant you that there are scorchers who bring discredit on the pastime—some reckless fellows who have no regard for road circumstances. With a clear road there is no harm in going at a reasonable speed, but on meeting untrained or restive horses it is most desirable that every motorist should exercise the utmost caution, or even stop and lend assistance in guiding the animals past. Every horse owner in his own interest should have his horses trained to motors. It is easily done. By and by I have no doubt the etiquette of the road will become better understood, and have something of the force of law. I am altogether against placarding cars with numbers, which, instead of leading to identification, might easily lead to

hardship and expense by causing errors. Many cases of this kind have occurred in France."

The Scottish Club.

To visit Mr. Moss the members of the Scottish Automobile Club (Eastern Section) assembled in Charlotte Square, Edinburgh, and proceeded via Princes Street and Clerk Street, the long line of cars being the object of considerable attention. Among those who took part in the run were: Messrs. John Macdonald, chairman, George Macmillan, Norman D. Macdonald, chairman of the General Council, Andrew Melvin, J. M. Inglis, R. Elliot Cranston, T. D. Rhind, J. Cruickshank, Thomas Sanderson, Charles Moss, W. L. Sleight, Councillor W. W. Macfarlane, John Lamb, Stevenson, A. Ure Barr, T. F. Ross, Hugh Clelland, and John Love. At Middleton Hall the party, which also included Mrs. James Moss, senior; Mr. and Mrs. James Moss, jun.; Miss Moss, and Mr. L. Moss; Treasurer Cranston and Mrs. Cranston; Mr. and Mrs. R. Crawford, Leith; and Mrs. R. Elliot Cranston, were entertained by Mr. H. E. Moss and his family. The afternoon was most pleasantly spent, and the Club arrived back in Edinburgh about seven o'clock.

The Red Flag Again.

THE Rev. James Boulton, of Wrangthorne Vicarage, Leeds, is seriously exercised in his peaceful seclusion at the busy scene to be witnessed on some of the outskirts of Leeds, where motorists pass along. He suggests that police should be placed at certain points of the Headingley and on the Leeds side of the main roads, carrying a red flag as in the case of railways, and we quote from the reverend gentleman's gentle epistle, "Let woe be to the man who ventures to pass that flag except at a very reduced pace." He suggests that fines should be totally abolished and a few months' residence in one of His Majesty's prisons be substituted for all motorists who have the temerity to go at a speed which he cannot appreciate and possibly does not understand. We had thought that the days of the red flag in connection with automobile matters had entirely passed away, and we do not think the suggestion is one to commend itself to the average policeman of the Southern Counties, who find the protection of some high hedge far more congenial than exposure on the public road, waving a red flag for the amusement of passers-by.

The Southampton Club.

THE Southampton County Motor Club is now in full swing, with a membership of twenty-four and an energetic hon. sec. in Mr. P. G. Headland, of Netherlands, Anglesea Road, Southampton, who will be pleased to hear from local motorcyclists. Starting from the Waterloo Road, Southampton, a run was taken to Winchester on Wednesday, and to-day (Saturday) the run will be via Hythe, Beaulieu, Lymington, Lyndhurst, and Totton. Wednesday and Saturday runs are contemplated, the destinations next week being Romsey and Salisbury respectively.

Lively Times Ahead.

THOSE motorists who journeyed to Brighton on Saturday and Sunday last, either by the Croydon or Reigate roads, seem to have had an exciting time, and the police, it is rumoured, secured the names and addresses of no fewer than fifty law-abiding motorists. Some of these victims were travelling so slowly that in sheer astonishment they pulled up even before the policemen were reached, wondering what was wrong. Then, to their amazement, when the third policeman appeared, they learnt that their car had been travelling anywhere between twenty-five and forty miles an hour. One of the traps was just beyond the end of the tram-lines, leaving Croydon, and notwithstanding, as one of the unfortunates informed us, he had, for the last few miles, been dodging on and off the lines to allow impetuous trams to pass him at thirty miles an hour, he was stopped for going at less than half that speed.

Other traps were between Reigate and the Horley corner, on a clear stretch of road without a house or pedestrian in sight, and here twelve smug-faced policemen valiantly arrested the paths of those pioneers who, while seeking health for themselves, are infusing the old life into our highways and byeways.

Ambulance Service.

THE Paddington Borough Council have addressed a communication to the London County Council urging the latter to consider the question of establishing an efficient service, either of horse or motor ambulances, throughout the Metropolis, and suggesting that the Metropolitan Fire Brigade stations might be conveniently utilised for the purpose of housing such ambulances. This is a step in the right direction, especially if the authorities interested in the movement recognise the most rapid and the most efficient method of locomotion in the provision of ambulances throughout the Metropolis.

A Snapshot at Sea Point, near Cape Town.

New Hope for Ireland.

ALTHOUGH the racing which is to take place in Ireland this year is perhaps the most popular aspect of things automobile at the present time, there is little doubt that we are on the eve of great developments in the Emerald Isle with regard to transit and transport generally. The forthcoming race will mean thousands of pounds to the people from the influx of visitors, but simultaneously with this there is going on a quiet and unostentatious movement which is likely to be of permanent value to the country. Some time ago we were able to announce that the Department of Agricultural and Technical Instruction for Ireland, of which the Right Hon. Horace Plunkett is the head, were quite willing to give every facility to projects for promoting motor-car services in the congested districts, but the exigencies of legislation have prevented them from going far in the matter, and at the present time the most hopeful scheme is that of which Lord Iveagh and Mr. J. W. Pirrie, of Belfast, are the moving spirits. These two gentlemen have formed an association for assisting Irish farmers in marketing their produce, and although the initial steps will be largely promoted by means of horse-drawn vehicles, the adoption of motor-cars will take place ere long. In several Kentish districts the conveyance of fruit by motor-vehicles to the London markets has been done with economy and expedition, whilst last season many of the fruit-growers of Worcestershire found the motor-vehicle very convenient, and practically the only means of getting their fruit to the market while fresh. So that there is already some experience on which to ground hopes of success.

The Suggested Scheme.

THE objects in view will be accomplished by means of—(1) Motor van services as and when required; (2) up-to-date canal boats; (3) existing railways, where they can be utilised; and (4) steamship services from the principal ports to London, Liverpool, Glasgow, Dublin, or Belfast, as the case may be. The motor-vans and other means of inland conveyance will carry the produce and goods to extensive depots, where the work of assortment, packing, and despatch will be conducted. There will be, according to the *Cork Constitution*, a general manager at a large central office in Dublin, a gentleman of great organising capacity and thoroughly conversant with the carrying trade. He will have entire control of the motor-van and other services, and will arrange that as far as possible there shall be no waste of mileage or journeys. At each of four large central depots there will be a superintendent responsible to the general manager, and a staff, including automobile experts, responsible for motor-car efficiency and for the handling of goods, to the superintendent. Farmers will be charged a reasonable rate for the conveyance of their produce, for which they will receive cash payments. The motor-van and car services will also be available for the products of corn mills, flax mills, timber mills, and other industries, such as the cottage manufacture of woollen goods now carried great distances to such centres as Carrick and Glenties, in County Donegal.

Sound the Horn.

Now that the touring season is commencing, and the roads are in a fit state to travel on, it behoves us once more to warn all and sundry of the necessity, when approaching cross roads and corners, to give audible warning of approach. If all users of the road do this there will be little fear of accident, but if the present reckless method indulged in by cyclists of swinging wide at a rapid pace round turnings is continued, then fearsome will be the results—not necessarily from cars, but from other cyclists. On Sunday last, at Worcester Park, Surrey, two cyclists thus collided, one being much cut about the head and face, and the other apparently injured internally, the cycles themselves seemingly smashed to pieces. A number of cyclists were present, and a good Samaritan in the shape of a clergyman, opposite whose Rectory the accident occurred, was in attendance, and so our car proceeded on its way.

Cycles and Motor Trailers.

THE motor-cycle seems to have brought into prominence the trailer, and the charm of the fact that a man is enabled to take his wife or sister with him when he goes touring is one that should appeal to all. But there is a black side to the picture, and that is the risk to the passenger in the trailer by the incautious travelling of the leader, who is liable to forget the attachment at the rear, and is apt to turn corners rapidly and capsize his passenger. Such an instance happened at Mitcham on Sunday, and both the lady and some of the spectators gave the cyclist a piece of their minds. As motorists we notice that the "combination" has a habit of keeping to the crown of the road, preventing other vehicles passing, and the reason of this, we imagine, is owing to the selfishness of the cyclist refusing to slow down with a view of moving to the side of the road. Such conduct should be avoided, and it should be remembered the road is for the use and enjoyment of the whole community.

Councillors Inciting the Police.

ACCORDING to Mr. George Clinch, the historian of Kent in Methuen's series of guides, many of the interesting features of Beckenham have perished in the process of expansion that has been going on there these last fifty years. But some archaic views prevail, and these have just been exhibited at a meeting of the local Urban District Council, where a councillor has declared motorists to be guilty of too speedy travel. The main arteries of the place were becoming as dangerous as level

crossings. Although the speed of motor-cars was essentially a police matter, it devolved upon them as public servants to see that something was done, and he (the councillor) ventured to move that the clerk be directed to communicate with the police, drawing their attention to the fact that they were dissatisfied with the condition of things and urging them to take more stringent practices to moderate the evil complained of. One having thus ventured, another councillor was emboldened to second the resolution, which found approval. Now that the police watch motorists and the councillors watch the police, the time is coming for motorists to watch the councillors—and so complete the circuit.

The Manchester Club.

THE second run this season of the Manchester Automobile Club was to Chester on Saturday last, and was attended by fifteen cars. The weather was everything that could be wished for, and there were no mishaps of any kind to mar the enjoyment of those partaking in the run. Dinner was served at the Grosvenor Hotel, some members returning the same night, others remaining over the week-end. Those present included Messrs. J. Arrowsmith, C. G. Borthwick, J. Bennett, C. Frost, T. W. Grace, A. E. Jones, W. Lloyd Jones, Livesey, W. McNeill, J. A. Morris, F. Smith, J. Hoyle Smith, hon. sec., L. G. Schwabe, and J. Stephenson, the cars represented being—Horbick, Cottreau, Progress, Belsize, Wolseley, Clement, De Dion, Daimler, and Panhard.

The Way to Bath.

Now that the electric tramway is being laid at Bath the road within two miles of the city on the London side is really unsafe for motorists. The surface is so loose in parts that car wheels sink four inches deep. To avoid this motorists can go through Bathampton to the left about two miles before reaching Bath. There, however, we believe, a toll of 3d. has to be paid.

The 60-h.p. Mercedes.

THE first of the 60-h.p. Mercedes arrived at Folkestone the end of last week. It was driven up to town by Mr. G. Higginbotham, the owner, and was stabled at the Regent Street Garage. The "sixty" differs somewhat from the "forty." The engines look magnificent, but to get the car within the 1,000 kilos weight many slight alterations have been made. Holes have had to be driven in the frame and many parts lightened until the car was a few pounds within the weight. A short run on the car convinced us it has all the charm of the forty, and, as the owner of one of the vehicles entered for the eliminating trials to-day, we felt thankful the "sixty" was not a competitor.

It has been decided to start the eliminating races from the inside of the Clipstone gates with a standing start.

THE General Purposes Committee of the Bermondsey Borough Council are considering the advisability of employing motor vehicles.

THE Prince of Wales has ordered an electric brougham from the City and Suburban Electric Carriage Co., Limited. This is His Royal Highness's third motor carriage.

ON the Canning Town track, on Wednesday, H. Martin beat the previous times for motor-cycles by riding eleven miles in 14min. 36.15sec., and twelve miles in 15min. 58sec., from a standing start.

THE Armourer Mills of the Lanchester Engine Co., Limited, Birmingham, owing to the greatly increasing demand for their cars, having proved insufficient, the company have taken another large factory in a central position.

THE following gentlemen have been elected as judges in the Reliability Trials of the present year:—Professor Vernon Boys, Professor Hole-Shaw, Lieut.-Col. Holden, Col. Crompton, Major Lloyd, the Hon. J. Scott Montagu, M.P., Messrs. Worby Beaumont, Lyons Sampson, Dugald Clerk, and E. H. Cozens-Hardy.

A NOVEL ELECTRIC CARRIAGE.

IN the novel electrical motor-car illustrated herewith the ideas aimed at are long wheel base, low centre of gravity, elegant appearance, and low cost of attendance. Of these the first two are attained and the third is a matter of taste upon which our readers can form their own opinions. The idea underlying the fourth was drawn from the inventor's experience of horse-drawn vehicles, in which the chief item of running cost was that of cleaning after use and the consequent wear and tear of paint and varnish, necessitating the frequent renewal of these. While engineers devote much time and thought to means for protecting their machinery from dirt and grit, the ordinary carriage builder seems to revel in exposing the most beautifully finished surfaces to all the mud and sand that can be thrown at them by rapidly revolving wheels and flying hoofs. Moreover, the construction is such that much of this foreign matter is lodged in intricate parts from which it is difficult and troublesome to dislodge it. An ordinary carriage and pair, for instance, is taken out in wet weather for an hour, during which four wheels and

wheel, and even the maximum does no harm except by offending the eye, an offence not committed when the wheels are almost hidden from view.

Under the conditions of construction described it was obviously necessary to have small wheels. Partly on this account, and partly as an experiment, a form of spring spoke wheel was designed—that is, a wheel in which the spokes are replaced by spiral springs having hooks at each end for attachment to rim and hub. To give stability these spring spokes are crossed in radial planes, or, in other words, those hooked to one side of the hub (which was wide and of a specially designed form to suit) have their other ends hooked to ears on the opposite side of the rim. The rims are of angle iron with solid tyres.

The motive power is electricity, the battery, consisting of forty-two cells of the Fulmen type, having a capacity of 120 ampere-hours, being carried in a box hung under the middle of the car, and the motor is of $4\frac{1}{2}$ horse-power normal, capable of working up to 7 horse-power for a short time. It is placed under the back seat, and drives by sprocket wheels and chains, the countershaft being geared direct to the main

Mr. J. Brown, of Belfast, on his Novel Car.

eight hoofs plaster it and its horses and harness with mud, taking a man two hours or more to clean off.

In the mechanically-propelled vehicle not only are the hoofs abolished, but there is an excellent chance of abrogating the evil of wheel splashing as well. In the car under consideration this is accomplished by enclosing the wheels under the body, each driver in a casing of its own, and the front steerers in a single forward compartment. The result is that the vehicle may be driven for any length of time over the muddiest roads and will remain as clean to all appearance as when it started, barring splashes caused by horses connected with other vehicles. Such splashes fall, however, not on intricate and involved constructions, but on plain surfaces, from which they can be removed in little more than as many minutes as the ordinary carriage takes hours to clean.

When we say "to all appearance clean" it is not forgotten that the wheels themselves get very dirty. So does every other carriage wheel in time. The chief difference is that in the present case the maximum amount of dirtiness is reached in a shorter time. More than the maximum mud cannot be stuck on any

driving axle, this being made possible by the spring wheels, which permit the axle to run in fixed bearings. The gearing includes two speeds, controlled by magnetic clutches, and these are increased to four by connecting the battery in series or parallel in the usual way. The controller is placed at the rear of the driver's seat and worked by the anchor-shaped lever at his left. The steering wheels are mounted on forks, bicycle fashion, and actuated by a steel cord on a drum on the steering wheel axle.

The motor, the gear, and the driving wheels are mounted on a strong angle iron frame in the rear. From this there extends forward a triangular frame, the apex of which rises in a swan-neck form to carry a crosshead, at each end of which are the bearings for the steering wheel fork-heads. On the middle of this triangular frame is hung the accumulator box. Upon this frame is placed the body, an entirely separate structure, which may be so arranged that after the removal of the steering axle and controller lever the entire body may be detached and lifted off, leaving the frame and all machinery completely exposed for examination or repair.

The general form and arrangements of the vehicle, for the illustration of which we are indebted to the *Motor News*, were devised by Mr. J. Brown, of Dunmurry, near Belfast, well known in scientific circles as an electrician, and to the automobile and cycling world as the inventor of the Viagraph, an instrument for testing the quality of road surfaces. The designing of the framing and machinery of the vehicle was carried out by Mr. Maurice Fitz-Gerald, M.I.M.E., Professor of Engineering in Queen's College, Belfast.

A NOTICE on the north gate of Arundel Park (Sussex) forbids the entrance of motor-cars and cycles.

THE Electric Battery Company has removed from Brixton to 180, High Holborn, W.C., where a plant for charging accumulators has been installed.

A LARGE garage, with inspection pit, etc., has just been com-

THE WHEEL BASE OF MOTOR-CARS.

IN nearly all the early automobiles the wheel base was what would now be considered very short, the wheels being spaced as in horse carriages, the dashboard coming about even with the extreme forward point of the front springs and wheels. As the speed of these cars was comparatively low, the mechanical disadvantages of this construction did not immediately become apparent. It may have been partly due to a desire of manufacturers to satisfy the public taste that in the now well-established makes of cars the wheel base has been gradually increased, but the chief reason for this factor in the evolution of the motor-vehicle is, remarks the "Horseless Age," undoubtedly a mechanical one. Every new model that was built was fitted with more powerful motors, and it was found that at the higher speeds thus made possible the vehicles had a

[Allgemeine Automobil Zeitung.]

pleted by Messrs. S. J. Bale and Co., of the Trafalgar Motor and Cycle Works, Newport Road, Barnstaple.

NEGOTIATIONS are in progress between the London General Omnibus Company and five makers of motor omnibuses for the provision of mechanically-propelled vehicles for London traffic.

THE Mayor of Southmolton (Devon) is urging the local Town Council to adopt new bye-laws regulating the speed of motor-cars passing through the borough. He regards the motor-car as "one of the biggest monstrosities of retrogressive civilisation."

MESSRS. FRISWELL, Limited, have been appointed sole concessionaires for Peugeot carriages in all the British Colonies, and have appointed Messrs. Rudge Whitworth exclusive agents for the Baby Peugeot for South Africa, Messrs. Turner, Hoare and Company for India, and Messrs. Schaefer and Company, of Wellington, for New Zealand.

very strong tendency to sideward slip on turns, and were not as comfortable in their riding qualities on rough roads as might be desired. Both theoretical investigation and practical tests demonstrated these two faults could be, if not entirely eliminated, at least materially reduced by the lengthening of the wheel base, and hence lengthening the wheel base has been the tendency among progressive designers. The question might be asked, what is a "long" wheel base? To this it can only be answered that the length of wheel base cannot be generally determined, but depends upon the width of the tread of the vehicle, the length of body, etc. Vehicles have been built in which the wheel base was only equal to, or just slightly greater than, the width of tread, which is entirely too short. For a vehicle intended for touring, a wheel base of one and one-half times the width of tread would not be considered too long, while one and one-quarter times the tread is certainly the lowest permissible.

THE IRISH FORTNIGHT.

A VIEW ALONG THE COURSE.

TO-DAY (Saturday) at Clipstone, on the estate of the Duke of Portland, the Eliminating Trial to complete the English team for the Gordon Bennett race will be held. Clipstone was, in the olden days, in the very heart of Sherwood Forest, and the Parliament oak, about a mile from the place, is probably one of the oldest trees in the district. The Duke of Portland's kindness in permitting motorists to go at their speediest on to estate is much appreciated, although the Clerk of the Weather was in such tearful

mood on the occasion of the last great trials on the Welbeck estate. On the kilometre over which the cars will run to-day some good records have been made, notably that of Mr. C. Jarrott equal to 80 miles per hour and the Hon. C. S. Rolls' more recent achievement. Mr. J. Lisle will drive the Star Car, and Mr. J. W. Stocks a Napier in to-day's trial.

In preparation for the forthcoming motor hill-climbing contests announced to be held near Castlewella, the Downpatrick Rural District Council, at their quarterly meeting, on the recommendation of the County Surveyor, voted a sum of £130 for specially repairing, by steam rolling and otherwise, the old road from Castlewella to Downpatrick, over which the hill-climbing contests are expected to take place. Castlewella is nine miles from Downpatrick, and from the park of the Earl of Annesley is

near Old Kilcullen, where the race will commence, and also the portion of the course as far as Carlow. According to the "Royal" Road Book, the road is exceedingly bumpy for the first three miles, but it soon improves, and is a very fair road all the way to Naas. Thereafter the road is fairly good, but has one bad piece shortly after Naas for several miles, to Kilcullen, when the surface again improves, and is in capital order all the way to Carlow. This is one of the best main roads, though it is not all that could be wished. The only hill of any consequence is a short one at Kilcullen (1 in 13, but not dangerous). The route possesses few interesting features excepting the Round Tower at Clondalkin, the Abbey and Rath at Naas, Old Kilcullen ruins, seen on the hill to the south of the present village, the Monastery Round Tower, and Cross at Castledermot, and the Court House and Ecclesiastical Buildings at Carlow.

Table of Mileages.

Dublin G. P. O.
10½, Rathcoole.
16½, 5¼, Kill.
20½, 9½, 3¼, Naas, Town Clock.
27½, 16½, 10½, 7½, Kilcullen.
36½, 26, 20½, 16½, 9½, Ballitore.
43½, 32½, 27, 23½, 16½, 6½, Castledermot.
50½, 40, 34½, 30½, 23½, 14, 7½, Carlow, Ogle's Hotel.

A book setting forth the routes so succinctly as shown in this illustration will be indispensable to strangers visiting the Emerald Isle.

A MEETING of the committee in connection with the course was held at the Royal Arms Hotel, Carlow. Mr. W. G. Goff, chairman of the Irish Automobile Club, presided, and there were present:—Messrs. J. Orde, and R. J. Mccredy; Colonel Neville Chamberlain, Inspector-General R.I.C.; Sir Henry Robinson, Vice-President Local Government Board; Hon. Cyril Ward, Mr. C. J. Engledow, Burton Hall, Carlow; Mr. Edward T. Quilton, C.E., County Surveyor, Carlow; Mr. Edward Glover, C.E., County Surveyor, Kildare; Mr. Henry V. White, C.E., County Surveyor, Queen's County; Mr. H. W. Crane, County Inspector

ROUTE 10. DUBLIN TO NAAS AND CARLOW.

Signs: < Road Fork, forward journey, > ditto reverse, + Cross Roads, J Road Junction, O Bridge, T indicates a sharp turn.
The directions R (right) and L (left) for the forward journey are above the Road Line, those of the reverse, below.

an extensive view of the whole range of the Mourne Mountains. Downpatrick is the county town of Down, and is regarded as the most ancient in Ulster.

THE "Royal" Road Book of Ireland, published by Messrs. Gall and Inglis, of Edinburgh, will be indispensable to the motorist visiting the Emerald Isle. It gives a series of elevations of the roads, with measurements and descriptive letterpress, no fewer than 177 routes being detailed, particulars of the road and points of interest being given in each case. As an illustration of the scheme so successfully carried out in the book, we give an illustration of the way in which the route from Dublin to Carlow is dealt with, and would advise motorists going to Ireland to preserve this page. It shows the way from Dublin to the point

Kildare; and Major Bain, Acting County Inspector, Carlow. As a result of the deliberations of the committee, arrangements were made for the necessary repairs of the roads along the course, and an expenditure was authorised of about £1,500 for this purpose, including widening curves, making culverts safe, and improving the surface generally. Arrangements were also made for patrolling the roads on the day of the race, which will be carried out by constabulary located at intervals of fifty yards along the route.

SOME of the social events that are being arranged will prove attractive to the lady visitors, who will be glad to learn that the Earl of Dudley will probably hold a garden party at the Viceregal Lodge, Dublin, on July 4th. The gymkhana in Phoenix Park will also be a notable event, and Mrs. C. M. Lloyd, of Adding-

ton, has offered a twenty guinea cup for competition by ladies in connection with the series of races comprised in that event.

THE motor boat race in Queenstown Harbour on July 11th will take place under the rules of the Marine Motor Association, and it has been decided to hold an Eliminating Race on the previous day, should such an event be found necessary. The length of the course has been provisionally fixed at ten miles, and the length of competing boats is not to exceed 40 feet. Two hands are to be carried, the helmsman being an amateur. The entries will close a month before the date of the race. Queenstown Harbour, where the race will take place, can be reached by steamer from Cork, the passage along the River Lee being one of interest and beauty; or in about half-an-hour by the Great Southern and Western Railway. By road Queenstown is fifteen miles from Cork, the route being over St. Patrick's Bridge and along fairly level roads until the destination is reached, where some stiffish hills have to be encountered.

MR. J. C. PERCY, who will probably know as much as any man of the Gordon Bennett course before the race is finally run, draws attention to one possible danger which we hope will be adequately considered and due precautions taken, viz. the number of animals met straying about the roads. In the course of a recent jaunt over the course, Mr. Percy met many goats, donkeys, pigs, etc., to say nothing of hundreds of geese and other poultry, and their contrariness, led to some strange incidents. Seeing that the course is in a typical rural district, where animals unaccustomed to anything like speed abound, it seems absolutely necessary that, some day or so before the event, owners should be particularly warned to keep animals under proper control.

BANBRIDGE is on the direct road from Dublin to Belfast, and many cars will pass through the place after the Cup has been won. In the centre of the town are the Iveagh Engineering Works of Messrs. R. S. MacCormac and Company. These are about three minutes' walk from the Great Northern railway station, and are well equipped with plant for the repair of motor-cars. Messrs. MacCormac and Company will be glad to render help to motorists in distress. Banbridge is generally well stocked with petrol and motor spirit, and there are not likely to be any difficulties on that account during the Irish Fortnight.

In several Irish districts motor-car services are being proposed, and the necessity of improving the street locomotion of Waterford has led a correspondent to suggest that a public motor-car service should be inaugurated there. It could start from the bridge, follow the Quay to The Mall, go down Beresford Street, up John's Hill to Passage Road, and return, extending its journey at train times to the stations of the Dungarvan and Trawmore Railways. It might then be found feasible to run occasional cars to Dunmore and other outlying places.

At a meeting of the executive committee of the Cork Exhibition it has been decided to hold, in connection with the Automobile Fortnight, a three mile motor race from Wellington Bridge to Carrigrohane Castle, and a hill-climbing competition at Marlborough Hill, near the city.

MESSRS. WINTON and OWEN, two members of the American team, will sail for England on the Campania on May 30th.

THE Austrian Automobile Club will hold its annual hill climb up the Exelberg on the 3rd May.

THE Rhenish Automobile Club is organising a race from Mannheim to Baden-Baden for the 10th May.

PRINZ JOACHIM ALBRECHT of Prussia is making a tour through the Rhine district on a 20-h.p. Durkopp car.

THE Fire Commissioners of San Francisco have ordered a motor-car for the use of the Chief Engineer of the Fire Department.

THE Canada Cycle and Motor Company, Limited, of Toronto, are reported to have completed arrangements for the extensive manufacture of electric vehicles.

CONTINENTAL NOTES.

By "AUTOMAN."

THE weather during the past week in Paris was quite wintry; snowstorms, hail storms, biting blasts, and heavy clouds alternating with spells of bright sunshine. It has not been in the least degree automobile weather, and those courageous motorists who have braved the elements have brought out their thickest furs and wrapped themselves up as closely as possible. The skidding problem has been most difficult to solve, for, although the north wind dried up the snow and sleet soon after it fell, the changes came so rapidly and varied so much in different parts of the city that it was almost impossible to know when one's car would run up to a wet, greasy road. The utmost precaution in driving was necessary, as was witnessed by the numerous *teles a queue* which were to be seen round certain bad corners. There is one corner particularly where a good private view of a bad skid can readily be obtained on a greasy day—I refer to the corner of the Champs Elysees and the Place de la Concorde, which is paved with wood, and which is very smooth, with a slight incline down from the Champs Elysees. The road is so wide, and the corner looks so innocent, that many otherwise cautious automobilists coming round it at a smart pace find themselves facing round the opposite way before they know where they are. The majority of the cars which circulate in Paris, especially the covered ones, employ some kind of anti-skid or *anti-derapant*, as it is called in French; but I have not seen the Parson's chain anti-skid as yet on a car in the French capital.

As the date for the Gordon Bennett Cup race approaches, the interest in the contest on the Continent is increasing, and great preparations are being made. There is no doubt that the French will make a colossal effort to get the Cup back, and no sacrifice will be deemed too great to accomplish this result. Rene de Knyff will, of course, drive one of the Panhard cars, and the other will probably be driven by one of the Farman brothers. The Mors car, which completes the French team, will be driven by Henri Fournier. There is a project on foot to charter a special steamer of 3,000 tons burden, which will take the French cars over with their drivers and with complete outfit, so that nothing may be neglected, and, according to the *Auto*, which draws its information from a conversation with M. Emile Mors, the steamer is to be used as a hotel for the French competitors and spectators. It is even rumoured that preparations will be made on board this automobile boat for a banquet, after the competition has been concluded, to celebrate the return of the Cup to its first home. *Qui ritra verra.*

On April 11th, in my "Continental Notes," I spoke of the Circuit des Ardennes as being held on the 20th and 21st of May. This, however, is an error, as the date fixed by the A.C.B. is June 20th and 21st. The question of the dates of the different race meetings is an exceedingly awkward one, and steps will have to be taken next year to regulate, internationally, the dates for important meetings. The Circuit des Ardennes falls right across the Paris Automobile Congress, and also the hill-climbing trial of Laffrey. Efforts have been made to induce the A.C.B. to change the dates; but this has been impossible, on account of local circumstances in the Ardennes, where village-fetes and horse fairs in the different localities surrounding the Circuit have had to be considered in the final fixing of the event, which will, therefore, take place on June 20th and 21st.

THE patent question is looming again on the horizon, and will call for the serious attention of those who do not wish to see the industry, which is now developing itself in such a splendid manner since the Maybach action cleared the air, hampered anew by an old man of the sea in the shape of detail patents. Everyone will be surprised to learn that Messrs. Panhard and Levassor have made a descriptive seizure in Paris at a depot of the German

Mercedes car. I have no intention to open up or enter in any way into an inane discussion as to who had the first idea for this or that improvement; but certain it is that the Mercedes car has made a revolution in the industry, and, deny it as they may, almost every reputable maker is copying, or trying to copy it, in some way or other. Nine times out of ten, if a customer wants a new car, the salesman is ready with the answer that the special carriage which he has got to sell has certain features

A Panhard Touring Car outside the A.C.F., Paris.

"like the Mercedes." It is, therefore, somewhat surprising to hear that a descent was made the other day by the bailiff, commissary of police, and an army of clerks on a Paris Mercedes depot, as the precursor of a lawsuit. Under the French patent law, if you suspect that a competitor is using goods which are subject to your patent, you have the right to obtain the assistance of the bailiffs and the police to swoop down on your competitor and examine the goods that he has got, and also inspect his books and "page" them—that is to say, the bailiff initials all the pages, so that the books cannot be destroyed or altered. A record is, therefore, on hand of the number of the supposed infringing articles used. The Cannstatt-Daimler Company are said to consider the whole thing as ridiculous, and, no doubt, they will take retaliatory measures. A straw, however, shows the way the wind is blowing, and those who have really the interest of the free, unhampered trade in England at heart need to take all the precautions necessary to prevent would-be monopolists from interfering with the English industry.

THE reliability trials of the Automobile Club of Touraine began on the 17th inst. There were only 20 competitors, but the meeting is interesting from the point of view of the rules that have been made for the classification of the cars, which have followed somewhat on the lines of those lately made by the A.C.G.B.I. The classification is to be made by the deduction of points from a fixed maximum under the following conditions:— (1) One point is to be deducted for every 1,000 frs., or portion of 1,000 frs., of the price of the complete vehicle in the maker's catalogue. (2) Five points are to be deducted for every centime of the kilometric cost of running. (3) One point per minute to be deducted for all breakdowns or stoppages, except punctures. (4) One point per 10 kilos of dead weight per seat. (5) Ten points per kilometre above an average speed of 30 kilometres per hour. (6) Two points per kilometre for any speed in hill-climbing less than 30 kilometres an hour. (7) One point per kilometre for any speed under 70 kilometres an hour on a level kilometre. (8) Up to five points each for comfort, elegance, silence, facility

of driving, verification of parts, and general appreciation by the jury. The competition consisted of daily runs of about 100 miles each from Tours, round the neighbourhood and back to Tours. Appended are the results of the competition:—

No.	Car	Average Speed kilometres.	Points lost.
1.	Georges Richard 14-h.p.	49.040	73.28
2.	Renault 14-h.p.	47.150	75.54
3.	Brouhot 12-h.p.	52.950	78.24
4.	Darracq 20-h.p.	51.680	81.63
5.	Delangère 16-h.p.	49.650	85.65
6.	Brouhot 15-h.p.	39.150	96.75
7.	Delahaye 8-h.p.	35.360	99.01
8.	Delahaye 12-h.p.	44.970	102.74
9.	Brouhot 10-h.p.	39.190	103.63
10.	Ader 8-h.p.	37.320	104.57
11.	C.G.V. 15-h.p.	52.040	114.07

2.	F. N., 2-h.p.	42.940	92.38

ASTONISHING reports of accidents keep coming in. The latest has occurred in Italy, where, in turning a corner down hill, the car of a Mr. Vomwilli ran over the side of the road and was smashed up, fortunately without serious damage to the occupants. The extraordinary part of the occurrence is the account given by the driver of how the accident occurred. The car, it seems, was going so fast that it actually reared up on its hind wheels on account of the centrifugal force, and the front wheels being in the air it became impossible for the driver to steer. I have driven all sorts of cars, fast and slow, been in all sorts of difficult positions, including the ditch, but I must confess that I have as yet to have experience with a car which, contrary to all known theories, rears up on its hind wheels and careers along to destruction in this peculiar manner.

The last photograph of Count Zborowski—A Snapshot just before the start of the La Turbie Hill Climb. [La France Automobile.]

THE entries for the Paris-Madrid of the second category closed on the 15th inst., and the number runs up to 277. Amongst the last names I notice Lord Carnarvon, Mr. Arthur Du Cros, and Mr. Harvey Foster. The latter will drive one of the new 50-h.p. Wolseley racers. The entries with double fee will still be received up to the 16th May, and no doubt the third century will be reached.

SOME NOTES ON CYLINDER LUBRICATION.

IT must never be forgotten that, even for two engines of identical size and make, there exists no arbitrary standard of the amount of lubrication required. This depends essentially upon two factors: (1) the work performed by the engine, and (2) the efficiency of cooling. With regard to the first factor, generally speaking, less oil is required on a smooth, level, dry road than on a rough, hilly one, this being dependent on the fact that less mixture is used, less heat is generated, and less oil, therefore, consumed in the former than in the latter case. But the variation required is never great.

The aspect of the subject from the point of view of the efficiency of cooling is especially important to motor-cyclists, who mostly use air-cooled engines, and to drivers of engines cooled on the thermo-siphon system ("natural" circulation). Air-cooled engines which are in a favourable position for cooling use up far less oil than those less fortunately placed. Again, taking two engines of identical make and size, one cooled by

Now, it is an excellent practice, and one which cannot be too strongly recommended, for the owner of a new car to also swamp his engine with oil until the plug becomes foul, utilising the spark-gap to obtain regular firing. He should then gradually reduce the quantity of oil until a point is reached when the plug no longer becomes foul. The ideal lubrication point for ordinary conditions of work has then been found—that is, the point at which the engine is taking all possible oil without danger of sooty deposit on the valves, piston, or plug. But it must be remembered that, for maximum efficiency, the amount of oil supplied to the engine should vary somewhat, as already stated, in proportion to the work. Most makers prefer to recommend some particular brand of oil for their engines, and an extended experience has convinced the writer that their advice should always be followed. Should trouble be caused on the road by fouling of the plug through excessive lubrication, and no spark-gap fitting is handy, the excess of oil must be burnt out of the cylinder. This is done as follows: the inlet valve or the plug (preferably both) are removed, and a few drops of petrol are poured into the cylinder, a light being then

The "Century" 12-h.p. Light Car.

pump, the other by natural circulation, the former, according to the writer's experiments, will require just double the amount of lubricating oil of the latter.

An important point, and one which is frequently overlooked even by quite experienced chauffeurs, is the relationship of lubrication to compression. When an engine is being efficiently lubricated there is a film of oil between the piston, piston-rings, and cylinder wall which makes the joint sufficiently tight to prevent escape of mixture to the under-side of the piston, and so serves to maintain compression. If this film is absent or inconspicuous, there will be loss of compression, and since the oil is being continuously used up it must be replaced at the same rate at which it is consumed.

When an engine is first tested at the works before the car is delivered to the purchaser it is literally "swamped" with oil, a proceeding to which we owe the discovery of the action of the spark-gap at Panhard's works. The plug, of course, speedily becomes foul, and, as is now fairly well known, an observant workman noticed that when a small external gap existed in the high tension circuit a spark occurred simultaneously at the plug, no matter how sooty the points happened to be.

applied. The cylinder should be allowed to cool before pouring in the petrol. Of course, such a procedure requires great care, or a conflagration may result.

Never run an engine without oil. If the supply gives out on the road, get any kind that is obtainable; even salad oil will do, in lieu of anything better. Finally, it may be stated that it is better to over than to under lubricate.

TO-DAY (Saturday) the members of the Manchester Automobile Club will hold a run to Alderley Edge.

THE Birmingham Motor Passenger Company will run a service of motor omnibuses on the Hagley Road route from the 8th prox. Six vehicles, each to carry twelve passengers, will be run from New Street to the Hagley Road fountain. The Lord Mayor is to be asked to inaugurate the service.

MESSRS. HEWETSONS, LIMITED, have sent us a copy of the new catalogue issued by Messrs. Benz and Co., in which particulars are given of the new Benz-Parsifal cars with the two and four cylinder vertical engines. The catalogue is well got up and includes illustrations of the motor, change-speed gear, and other details.

SOUTH AFRICAN NEWS.

[FROM OUR OWN CORRESPONDENT.]

CAPE TOWN, April 1st, 1903.

AUTOMOBILISM is going strong at Johannesburg. Mr. A. Bailey has just received a 22-h.p. Daimler, and the business of the Johannesburg Motor-Car Company, Limited, has been purchased by Messrs. A. R. Atkey and Company, and will be carried on as the Johannesburg Motor Mart in Main Street and Kruis Street, Johannesburg. Mr. Atkey was the hon. sec. of the Nottingham Club, and came out on a visit to South Africa after the Welbeck trials last year. The garage at Johannesburg will be open day and night.

The first journey by motor-car from Kimberley to Bloemfontein has just taken place, Messrs. Kitchener and Day, of the former town, having done the journey between 10.30 a.m. and 7 p.m., with only one stoppage.

In Cape Town, the 12-h.p. motor-lorry of the Dunlop Motor Co. is a very familiar feature, and recently was taken by Mr. Donald Menzies on a trip from Cape Town to Clanwilliam, a distance of 156 miles, over varied roads. A three-ton load was carried and the daily mileage was between thirty and forty. In some places the gradient was 1 in 5 on a very loose road. Here

great difficulty in going down, the drivers tying their wheels up. Owing to the pneumatic tyres, it was of course impossible to tie the wheels, so Mr. Edwards inspected the gorge before proceeding, deciding to go down by inches, throwing the engine-power off, and leaving it in gear as an extra braking power.

After negotiating another heavy mountain pass, they drew up at the Stettin ostrich farm for lunch. From there they proceeded to Worcester over heavy sandy roads and sluits—ditches running across the road at right angles—arriving there at 5.15 p.m., covering the distance, omitting stops on the road, in three hours less than the post cart. On arrival they were fortunate in getting a fresh supply of petrol for continuing their journey. On the following day a river had to be forded. They dashed into it on the top speed, but when only a few inches from the opposite bank the car refused to move. After spending three hours trying to dig the sand away in order to give the driving wheels a chance, they succeeded, by reversing the car, in getting it out of the water on to the lower part of the bank, but the clutch, being wet, would not take the heavy incline up to the top of the river bank. After tramping along the road in search of assistance, a Kaffir with three donkeys trekking to Wellington was persuaded to help. Nearing the river again two mules were sighted, which were

Miss Maggie May on her "Mercedes" Car.

[The Biograph Studio.

and there were stretches of sand which would threaten to capsize any ordinary wagon, but, though it took time, the lorry went through all right. On the return journey Mr. Menzies had only a load of 1,000 lbs., and came back in 3½ days with the lorry in excellent condition. This must be considered a very good result, for the lorry was only built for light town work. A vehicle specially built for country work would no doubt be found very serviceable, and up in the Prieska and Kenhardt districts, where animal traction is difficult at present, motor lorries should solve a serious question.

Yesterday I called upon Mr. Ernest Edwards, who has just returned from a 300-mile tour through Cape Colony on his 7-h.p. Panhard. He left Cape Town at noon on the 14th ult., and arrived at Caledon at 6.30. Starting at seven on Monday morning, the railway was crossed and the party proceeded over the heavy mountainous road to Villiersdorp, arriving there for breakfast. This was a very heavy part of the journey, but they were able to run without engine power down many of the steep mountainous roads. Between Villiersdorp and Worcester, near Leroux's farm, they encountered a heavy sand drift. Some farmers informed them that it would be impossible to proceed over the mountain roads ahead, and all carts and wagons had

captured and spanned in to the work, the donkey harness being used for the purpose. By dint of much hauling, pushing and digging, the car was got out after a delay of four hours. At night they were glad to get to Wellington, for they had been on the car 12½ hours without any refreshment.

On the following morning, Wednesday, a start was made for Paarl, and Cape Town reached the same day over a very fine road, which was most enjoyable after the drifts, ditches, grades and rivers encountered on the journey of 300 miles at a speed of three miles an hour on some occasions, and actually travelling twenty-seven hours with engines running. Only sixteen gallons of petrol were used for the whole 300 miles.

The motor trade is coming round nicely here. The Dunlop Motor Company with the Gladiator, Panhard, and De Dion agencies, the Rudge Whitworth Cycle Company with the Lanchester and Wolseley, the Continental Caoutchouc Company with the Benz, and the Raleigh Cycle Agency with the Oldsmobile and Reading steam car, all have their automobiles running here in Cape Town.

THE Dunlop Pneumatic Tyre Company are now supplying the "Rucker" motor tubes.

PRIVATE MOTOR-CAR STABLES.

THE motor-car being a more pretentious vehicle than the bicycle, cannot be conveniently kept in the hall or kitchen, so that the question of storage is one that has to be faced by all prospective purchasers of motor-cars, some of whom are held back by reason of the outlay needed for a stable. A little investigation, however, shows that the cost of housing an automobile is less than that required for a horse and carriage—ordinary conditions being equal, and, on account of the cleanliness of the automobile, the stable may be erected

Fig. 1.

as close to the residence as desired. The regular expenses of maintenance are limited to washing the car and sweeping out the house. There are no extras except those met in the operation of the vehicle and heating the stable in winter if the car is used frequently during the winter months. The automobile house may be made as simple and cheap as desired, or it may be built as elegantly as the pockets of the motorist will allow. For the

Fig. 2.

small one-car stable there are few requirements. There must be room in which to place the car and space to work round it on all sides. There should also be room for an extra car if possible. There should be plenty of light—consequently plenty of windows; while for artificial lighting at night electricity should, if possible, be installed. A work bench, water connections, and some arrangement for storing petrol safely are other necessary requirements. We reproduce from the "Motor Age" illustrations of two typical motor-car stables. The entire cost of the one in

the first picture was, according to our contemporary, less than £20. The stable is 12 ft. by 14 ft., is equipped with a work bench and tools, has a pump connection with the cistern, so that plenty of water is always at hand, and is lighted by electricity. The second illustration shows a combined stable and gymnasium, built at a cost of £160. The building is 18 ft. square, and affords ample room for a large touring car. The floor of the stable is made of cement, with a fall to the centre, where there is an outlet for water. Six windows provide abundant light in daytime, while electricity does duty at night. In one corner is a water tap, while a work bench is also provided. Under the staircase is a large closet, which provides plenty of room for storing miscellaneous parts, tools, etc. There are many motorists up and down the country who must have already settled the question of stabling their cars, and for the benefit of others we shall be glad to receive photographs of private motor-car stables, together with brief particulars of their size, equipment, and cost, for reproduction in the *Journal*.

THE "ROTHWELL" LIGHT CAR.

TO meet the demand for a popular-priced vehicle the Eclipse Machine Company, Limited, of Oldham, have lately introduced the "Rothwell" light car, illustrated herewith. As will be seen, it follows the now generally-adopted lines, the power being supplied by a 6-h.p. De Dion engine located in the front of the frame, under a bonnet. The water circulation is maintained by pump and radiators, while the speed

The "Rothwell" Light Car.

of the engine is regulated by the ignition and a hand-controlled throttle valve. Three speeds forward and a reverse motion are controlled by a single lever. The power is transmitted to a rear live axle through a cardan shaft and bevel gearing, the drive on the top speed being direct. The car has a wheel base of 6ft. 3in., while as to brakes, a pedal controls a double-acting one on the gear shaft, and a hand lever at the side actuates expanding brakes acting on the inside of drums connected to the hubs of the rear road wheels. Two bucket seats are provided, ample accommodation being available at the rear for luggage. The weight complete of the vehicle comes out at about 8½ cwt.

LAST week a 6-h.p. Regal car driven by Mr. J. H. Adams succeeded in climbing all the hills between London and Guildford on top speed.

BEFORE the Science Society of the City of London College Mr. Eric W. Walford is to read a paper on "The Motor-Car of To-day," on Friday, the 25th inst., illustrated by means of diagrams and lantern slides.

THE motor-bus placed in service by the Eastbourne Corporation starts from opposite the railway station and runs along Terminus Road, the Grand Parade, to the Pilot at Meads, returning via Meads Road, for a fare of threepence.

SOME USEFUL NOTES.

THE entire wiring of a car should be carefully examined from time to time for signs of wear in the insulation. At certain places the wires are exposed to continual, if slight, friction, which will ultimately break through the insulation and establish a short circuit. The timely application of a little insulating tape will often save much trouble in this respect.

THE heat of the exhaust pipe or silencer will melt the insulation of the high tension cable, if too close, and cause a fault.

AFTER a car has been in continual use for some time, it is not a bad plan, if one has nothing particular to do, to thoroughly overhaul the cooling system, wash out the watertank and the jackets, and thoroughly cleanse the pipes and coils by means of a hose. It is wonderful what a lot of dirt accumulates after a spell of continual use.

IN a four-cylinder engine there are, of course, four wires to the contact-breaker or commutator; now four wires or four

very often a delusion. These lubricators, by means of copper pipes of extremely limited cross-section, are supposed to distribute the grease to the various bearings, etc., the pressure being applied to the grease by a screw. This sounds well in theory; but, if the various little pipes are disconnected, it will often be found that grease is only going through about two of them, the others being empty. If the hitherto empty ones are started by means of temporarily stopping the others, but still fail to work satisfactorily, the only plan is to use thinner grease. It is well to note this, as damage has often been done through some parts being insufficiently lubricated.

NOVICES in motor matters should be very careful to see that the ignition lever of their cars is retarded before they attempt to start the engine. Otherwise the nasty blow of a "back-fire" may be experienced.

IT is advisable for the newly-fledged motorist to practice on the brake, and learn to estimate both distance and the speed of the car accurately before using it in crowded thoroughfares.

The Benz-Parsifal 12-h.p. Vertical-Motor Car. (See issue April 4th, page 91.)

terminals can take up twenty-four different positions, and only one combination is correct, so it is as well to mark the wires when removing them, or to know how to replace them correctly, which, in reality, is not a very difficult matter. Rotate the engine-shaft and note the order the exhaust valves close, so that the order of working of the four cylinders is known. Now start with No. 1 cylinder. We will assume that the wire to the sparking plug has not been disturbed. Commence with the piston at the top (suction stroke), and turn engine shaft one revolution, put the commutator to late firing, and look at it carefully. It will be seen that one of the brushes is just on contact—*voilà tout*—one wire is correctly affixed, and the rest are done in the same way. Of course No. 1 commutator wire is found by earthing the wires to the frame till No. 1 trembler vibrates.

IT is well to remember that in the case of large high-powered cars that run every day of the week, one day should be set aside solely for the purposes of adjusting the engine, general overhauling, etc. If this plan were always adhered to, we should not see so many cars drawn up by the road-side having trivial adjustments effected.

THE grease lubricators found on the dashboard of cars are

BEGINNERS should make a study of the anatomy of their vehicles, or they never will become intelligent or satisfied motorists. The comfort of knowing how to repair any of the minor causes of stoppage can only be estimated when they come to grief miles away from any one capable of doing the repairs or adjustments for them.

FULLER'S earth, which can be obtained from almost any chemist, is a good dressing for a slipping friction clutch.

SOMETIMES a motor may suddenly stop from the failure of the exhaust valve to seat properly. This may be due to the warping of the valve through the engine having run dry and become too hot, or it may be from the failure of the closing spring or the sticking of the valve stem in its guides. The valve should be removed, and the stem cleaned and scraped—or straightened if it requires it—until it moves freely in the guide and the closing spring given its full tension. If the valve still leaks so that the engine will not start or develop sufficient power, the valve will have to be ground into its seat.

ONE should always be on the look-out for "squeaks," for any such unusual noise is evidence of lack of lubrication and generally foretells a breakdown unless heeded at once.

MOTOR-CYCLING NEWS.

It will be remembered that in our issue of the 21st ult. we published "A Novice's Experience of Motor Cycling," written by a motor cyclist who signed himself "A Satisfied Yorkshire Novice." In relating his experiences he mentioned that he had tied a seat on spiral springs to the rear of his 2½-h.p. tricycle, on which he

A Family Party.

carried two children, and that lately he had acquired a double trailer, in which, owing to the district in which he resides being flat, he is able to take his wife and eldest daughter about without difficulty. We are able this week to reproduce a photo of this family party. As Mr. J. H. Duke, the motorist in question, says, "It is marvellous what a 2½-h.p. motor will do when kept in good condition and repair."

THE annual general meeting of the Motor Cycle Union of Ireland was held under the chairmanship of Mr. R. J. Mecredy. The election of officers resulted as follows:—President; Mr. R. J. Mecredy; Vice-Presidents, Messrs. W. R. M'Taggart, J. B. Dunlop, sen.; Hon. Secretaries, Messrs. J. C. Percy and M. R. Wheeler; Hon. Treasurer, Mr. W. A. Wallen; Committee, Messrs. L. De Groot, J. B. Dunlop, jun., T. W. Murphy, L. R. Oswald-Sealy, F. Russell, G. J. Ball, W. Evans, W. G. Wilkinson, Dr. Lane-Joynt, E. F. Walker, and W. H. Green, with power to co-opt an additional member.

IN view of the success attained by the motor-cyclists in scouting and despatch work at Easter, we understand that Major Liles intends to organise a motor-cyclists' section in connection with the 26th Middlesex (Cyclists') V.R.C. Anyone desirous of joining the new section will do well to apply to the Acting Adjutant at the headquarters, 69, Lillie Road, London, S.W.

THE members of the Motor Cycling Club have been invited to luncheon with the vice-president, Mr. E. Kennard, at "The Barn," Market Harborough, to-morrow. It is intended to leave London to-day (Saturday), starting from Marble Arch at 2.45 p.m., calling at Old Salisbury Arms, Barnet, at 3.30 p.m., and journeying to Northampton. Members joining in the run will stay overnight at Northampton, and proceed to Market Harborough on Sunday morning.

THE American National Association of Automobile Manufacturers has appointed a committee to look into the question of how best to deal with motor-car mechanics. Similar committees will be appointed by the Automobile Club of America and the American Automobile Association. These bodies will probably act in conjunction to stop the collection of commissions by mechanics and to put a stop to them taking out the vehicles of their employers.

WE learn that during the week of the Agricultural Hall Motor-Car Exhibition the New Hudson Cycle Company, Limited, booked orders for no less than sixty-one motor-cycles.

ARRANGEMENTS are in hand for the formation of a motor-cycle section of the Lincolnshire centre of the National Cyclists' Union.

THE Dublin centre of the Motor Cycle Union of Ireland have arranged to hold the opening hill-climbing contest of the season at Glenamuck, on Saturday, 9th May. All machines must be fitted with mud-guards and silencers approved by the committee. Each rider will only be allowed one trial. The Union Gold Medal will be awarded to the successful competitors, and a facsimile in silver to the runner-up. The competition is confined to machines of 3-h.p. and under.

THREE different makes of English motor-bicycles will be represented in the Paris-Madrid race, the Bat, Humber, and Ormonde Companies each having entered two machines. The Bats are numbered 251 and 252, the HUMBERS 269 and 270, and the Ormondes 280 and 281.

THE motor-bicycle shown in the accompanying illustration is the production of the South Hants Motor Company of Portsmouth, who have named it the "St. Julian." In sending us the photograph, reproduced herewith, the makers state that "We have long been of the opinion that in order to develop the full power of the engine you must have vibration helping you along instead of checking the machine. With the engine placed between the wheels an enormous amount of power is wasted in overcoming vibration, while with the engine placed behind, the resulting gain of power is very marked. The vibration, again, is entirely confined to the back triangle, the rider and the steering wheel being entirely free from it, riding it being just like sitting on an ordinary free wheel bicycle. Owing to the weight of the engine being below the line of gravity (i.e., the two hubs of the wheels) we have, up to the present, found it impossible to make the machine sideslip. We tried

the machine up Portsdown Hill on April 1st, a wet, muddy day, without gearing up and with an ordinary 2½-h.p. Minerva engine, and, starting on the rise, a speed of 30 miles an hour was attained before reaching the top." In addition to those mentioned above, a number of other advantages are claimed for the new machine. We may mention, however, that the fitting of the motor behind the rear wheel is not a new departure, for on page 743 of the *Journal* for Jan. 26th, 1900, will be found an illustration of the Pernoo motor-bicycle, to which the St. Julian bears considerable resemblance.

HERE AND THERE.

THE Lycett Saddle and Motor Accessories Company, Limited, has just been registered with a capital of £10,000.

THE "Pall Mall Gazette" wonders why no daily motor-car service between London and Brighton has been started.

A GARAGE and charging station for electrical vehicles is about to be opened in Curzon Street, Piccadilly, by the Electro-mobile Company, Limited.

MESSRS. W. J. BISHOP AND COMPANY, of Croydon, have lately brought out a useful little incandescent lamp for testing

the voltage of ignition accumulators and also for inspection purposes. As will be seen from the illustration, it is fitted with a protecting reflector and a plentiful supply of conducting cords.

THE Automobile Club of America has now a total membership of 418, of which 346 are active and 72 associate member. On the 1st March members owned 542 automobiles and had 147 under order.

A WELL-KNOWN motorist was recently heard to remark that half the "fun" in owning a motor-car is in being able to overcome all perplexing obstacles one's own self, and to be always master of the situation.

It is reported that an engineer from the Luneville Works of Messrs. De Dietrich and Co. is now in the United States for the purpose of locating a site for works for the manufacture of the De Dietrich cars in America.

THE Ordnance Survey have recently issued a folding pocket map of Salisbury and the surrounding district. This is one of the series of maps of certain areas in England and Wales on the scale of two miles to one inch, the publication of which has just been commenced under the authority of the Board of Agriculture.

THE London Motor Engineering Company, Limited, has been registered with a capital of £5,000 to carry on the business of engineers, makers and repairers of motor-cars, parts, and accessories, etc. The registered office is at 87a, Wellesley Road, Gunnersbury.

THE latest enterprise of Mr. Frank Morriss, of King's Lynn, is the purchase of an old and disused Primitive Methodist Chapel in the London Road. Once in possession, Mr. Morriss had the interior pulled out, the floor re-made, and the premises done up generally, to convert them into a garage capable of accommodating over thirty cars.

THE education of the motorist is a thing which cannot be completed in a minute; in fact, motoring is one of those matters in which experience is always being acquired. By this it is not meant that it is difficult to drive a motor-car, but as the driver of it gains his knowledge so will he become more and more satisfied with the results obtained.

MR. O. CHANUTE, the American authority on aeronautics, being in London for a short stay, the Committee of the Aero Club have invited him to be the guest of the Club at dinner at the Carlton Hotel, London, S.W., on Friday, the 24th inst. On Thursday he read a paper before the Aeronautical Institute descriptive of the progress of Aeronautics in the United States.

THE evening papers must be sadly in want of news when they chronicle such items as this:—London pawnbrokers are, it is reported, becoming quite accustomed to dealing professionally with motor accessories. Folks returning from a rural spin often

find themselves short of cash temporarily, so they find a pawnbroker's shop a most convenient solution of the difficulty.

MR. TIMBERLAKE, of High Street, Wigan, informs us that a few days ago he drove one of the 8-h.p. M.M.C. cars up Bank Brow, Upholland. The hill, which is over half-a-mile long and has a gradient of 1 in 5, is the steepest and worst surfaced road in the neighbourhood, and the performance has attracted much attention in the locality.

MESSRS. LONGSTRETH'S, Limited, the patentees and manufacturers of the Litanode system of electrical storage, have lately adapted the principle to ignition cells for petrol motor-cars. The 20 ampere-hour set weighs 8 lbs., and its dimensions are 4 inches square by 5½ inches high. The battery is fitted with overhanging terminals, which prevent the acid from so readily reaching them. The special feature of the Litanode accumulator is the extreme hardness of the positive plate, which is claimed to be absolutely unaffected by vibration.

ACCORDING to the present laws in Michigan, steam motor cars are required to carry planks for crossing bridges and to do several other ridiculous things that are wholly reasonable when applied to threshing machines. Senator Goodell fears that some day a country justice may be seized with a desire to enforce the law "as it is writ," and he has therefore introduced a Bill exempting the steam car from the provisions of the steam vehicle law.

MESSRS. MANN AND OVERTONS, Limited, inform us that they have taken up the agency for the Georges Richard voiturette. The car, of which during the last three years nearly a thousand have been sold on the Continent, is fitted with a 5½-h.p. water-cooled engine, three speeds forward and reverse, and will run up to 25 miles per hour. Two brakes are fitted, as also inclined wheel steering, and wire or wood wheels. In the 1901 Paris-Berlin race (tourist section), two of these cars covered the whole distance without trouble of any kind.

THE Electric Ignition Company, of Birmingham, have just brought out a new induction coil for use on petrol motor-cars. The principal new departure is found in the trembler, which, instead of being an oblong strip, is forked, each end having its

The Repairs Department of the New Works of the Ryknield Engine Co., Ltd.
[R. Keene.]

platinum tip. Instead of the usual single adjustable terminal above the blades there are two, these being so adjusted that the trembler has a slight rocking motion, this action giving, it is claimed, the same effect as an external gap in the high-tension circuit. A feature of the coil is that small lettered white discs are let in the case close to each terminal, while in the lid is one giving instructions how to adjust the trembler. The work of properly connecting up the coil in the circuit is thus rendered easy, even to those having no electrical knowledge.

LORD HASTINGS has ordered a 14-h.p. "Brooke" car.

THE Turin section of the Italian Automobile Club will hold its annual hill-climbing competition on Mont Cenis on July 5th.

MESSRS. R. AND W. BROWNSWORD, motor car agents, have removed from Lower Hillgate to 19-27, High Street, Stockport.

A RACE from Paris to St. Petersburg for 1904 is again being mooted in motoring circles on the Continent.

THIS season motor-boats are to be utilised at Penzance in connection with sea angling.

LIEUT.-COL. HOLDEN, R.E., F.R.S., has lately acquired a 10-h.p. Georges Richard car.

THE Continental Caoutchouc and Guttapercha Company are bringing out a non-slipping motor-cycle tyre.

MR. J. A. BRODIE, the City Engineer of Liverpool, has purchased a 10-h.p. M.M.C. car.

THE garage of the South Hants Motor Company at the Floating Bridge Works, Portsmouth, is open day and night.

PROFESSIONAL cyclists are said to have been enlisted in the police service of New York to chase the motor record makers in Fifth Avenue.

THE Midland Garage and Motor Agency in Station Street, Birmingham, has issued a list of charges, etc. A feature is made of private "loose boxes."

A PARTY of Bromley (Kent) tradesmen journeyed to Brighton the other day by motor-car for their annual dinner, returning the same evening.

THE motor department of Messrs. Pearson and Son, Limited, in Market Place, Nottingham, has recently been considerably extended to cope with the growing business.

THE Belgian State Railway authorities are reported to be about to adopt motor wagons for the transport of goods in Brussels, Antwerp, and other large towns.

A PROPOSAL is being considered by the members of the Automobile Club of America to hold a parade of automobiles in New York in May, to give the people an idea of the increase in the number of power vehicles in the city.

COUNT ZEPPELIN has announced his decision to abandon the attempt to solve the problem of the steerable balloon. The shed on the shore of Lake Constance, and all the materials collected are offered for sale by auction. Count Zeppelin sold his family estates, spent his entire fortune, sacrificed twenty-five years of his life, and now in his old age has to admit that he has failed.

FREQUENTERS of Holborn are made daily familiar with the motor-car by the presence of several vehicles outside the show-rooms of Messrs. A. W. Gamage, Limited. A re-arrangement of the premises has lately been made, and a large central hall is being devoted to the display of light cars and accessories; hence the frequent presence of motorists in the vicinity of the establishment. On the occasion of a recent call, the manager deplored the absence of the Gamage voituresses, for since they were shown at the Agricultural Hall Exhibition it has been difficult to keep an adequate stock, so persistent has been the demand. The firm has brought out a new motor-cycle lamp with an oval front and a hood preventing the brilliant light obtruding itself on the face of the rider. A neat accumulator case has been introduced, in which a lining of tin secures the life of the case, thwarting the destruction of the leather with which motorists are familiar. Flaps of rubber are provided at the top of a sufficient depth to prevent any ill effects from the presence of the metal, the whole being an arrangement conducive to the durability of the case. Several stylish novelties for ladies' wear are to be seen in the clothing department, a neat net to protect the hair when motoring in windy weather being notable. Altogether a complete range of motor accessories and parts is to be seen at Messrs. Gamage's, who are developing their motor business to good proportions.

CORRESPONDENCE.

THE NEW ACT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—On Sunday I motored from Lincoln to Bury via Manchester. Upon arrival at the latter town I made for some tea, calling at the Imperial Hotel, Piccadilly, the first hotel coming into the city. I was refused the meal asked for as I could not show a return half of a railway ticket, and was informed that this was necessary under the new Act. The hour was 5 o'clock in the afternoon. Perhaps other motorists will give their experiences elsewhere.—Yours faithfully,

CHESTER FOX.

THE ABOLITION OF CHANGE-SPEED GEARING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Much blowing of trumpets has taken place in the daily press anent a French car built with eight cylinders for the purpose of endeavouring to attain the elimination of change-speed gearing. We are told of the wonderful facility with which the new car can be manipulated, gliding from slow to fast, from fast to slow, silently and instantly by a movement of the throttle lever alone. We are told of the wonderful flexibility of the engine, with its speed range varying from 250 to 1,500 revolutions per minute, and we are further told that a low second or reserve gear is found necessary and a reverse. The results obtained are heralded as something quite new and showing the marvellous improvements recently effected by French manufacturers of motor-cars. Whilst not desiring in any way to deny that such results as those stated are obtained in the new car, we desire to point out that they are no more—if anything rather less—than have been obtained by Mr. Duryea since 1897. Mr. Duryea obtained the same result with three cylinders, securing a greater range of flexibility, viz., from 150 to 1,500 revs. per minute. He does it without the use of countershaft, drive shaft, or bevel gearing, with a single chain.—Yours faithfully,

H. STURMEY.

PUBLIC MOTOR-CAR SCHOOLS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Are there any privately owned places in London or the suburbs where an amateur can learn to drive and control a motor vehicle? I am anxious to buy a car, and with this in view have been favoured by several firms with "trial trips" on their cars. But, of course, I was not allowed to drive the vehicle myself, and I fear that if I do purchase one I would make a fool of myself if I tried to learn to control it on the public streets, and possibly be held liable for manslaughter or some less serious crime, owing to the damage done to his Majesty's lieges.—Yours truly,

WOULD-BE MOTORIST.

HEAVY OIL MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In view of the trouble that is apparently being experienced by users of petrol cars with regard to the quality of petroleum spirit now being supplied, it is *apropos* to put the question as to whether any progress is being made with regard to the use of ordinary petroleum for the motors of automobiles. I notice that Messrs. Roots and Venables are still making vehicles with heavy oil motors, but apparently they have the field entirely to themselves. Some years ago a good deal was heard in France of a heavy oil car known as the Koeh. It appears, however, to have dropped out, for I failed to come across it at the last two *Salons* in Paris.—Yours truly,

PETROLEK.

THE SPECIFIC GRAVITY OF PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Knowing your interest in all matters pertaining to automobiles, I think it right to inform you of a very curious trouble which I have of late been experiencing.

During the last week my engine has been continually missing; it would, for instance, take the beginning of a hill in splendid style and then all of a sudden it would miss two or three times, necessitating my dropping to a lower gear, which, when all goes well, is quite superfluous. I tried everything—ground in the valves, overhauled the ignition, etc.—but all of no avail. Last night I compared notes with two friends, who drive different makes of cars, and they both informed me that they had not been able to move, as their engines had been continually missing, and all their efforts had been of no avail. One of them tested his motor spirit, and found it .720; he then put in some petrol, which test showed to be .685, and he came home from Worthing without a single miss. In case other motorists have been similarly troubled, it might be of interest to record the above facts in your valuable columns.—Yours truly,

A. E. COHEN.

LETTERS on the subject confirmatory of the views of other correspondents have been received from Mr. J. H. Knight and Mr. W. S. Smith.—ED. M.C.J.

ENQUIRER writes:—"Would any of your readers with experience in motoring give me their opinion on the suitability of a car or motor-cycle for canvassing work? The roads I travel are hilly and not well kept. I am afraid the cold weather would cause rheumatics in my legs—have had them before—were I to ride a motor-bicycle.

THE CLASSIFICATION OF MOTOR CYCLES.

REPLYING to Mr. E. H. Arnott's recent letter, Mr. J. Van Hooydonk writes:—"To anyone having the handling of motor-bicycles, it must appear a most unsatisfactory, not to say crude, method of classing machines by simply putting the whole lot on to the scales, and classifying by the result. The dangerously light machine to which this would lead could only have an ending in serious accidents. If Mr. Arnott thinks that, handicapping motor-cycles must be very much a lottery, surely the matter is one worth working out on some scientific basis at first, which would be assisted by experience afterwards, in preference merely to adopting the weight classification because this has been done on the Continent. A case in point:—When I entered for the kilometre race at Bexhill in 1902, I rode down by road on a heavy machine, equipped with comfortable saddle, spring handle-bar and seat-pillar, wide mud-guards, and other little additions which went to make the machine what may be fairly termed a 'touring bicycle.' As it was, however, the machine was not eligible for the tourist class of 112 lbs. All I had to do was to take off the brake, mud-guards, spring bar, and seat pillar, and, instead of the heavy comfortable saddle, use one made of a piece

"I have in my experience had many purchasers of Continental and American-built motor-bicycles, who have been attracted by the apparent light weight of the machines, bringing them to me to—what can only be properly described—make them fit to ride. Front forks had to be strengthened, levers were merely bits of bent tin, and had to be replaced, sensible mud-guards and saddle had to be fitted, and brakes rendered so that they were really of use on the road. In my opinion, there is no doubt whatever that this keeping down of weight was responsible for these required alterations.

"May I state another experience? In the race of the Circuit des Ardennes last year, of which I was a spectator instead of a competitor, owing to an unfortunate accident the previous day, I saw about twenty-four motor bicycles, all of Continental build, start. Most machines had very powerful motors, but the machines complete were built to come within the 50 kilos class. The bulk of the machines made a sorry sight. Petrol tanks, sufficient for about only half the journey, were fitted. A small accumulator was strapped on to an odd part of the machine, bits of wire were used for levers, electrical wires were slung on just anywhere, yet motors large enough to propel a small car were used. Most of the starters did not return at all, and of those that did go through, the fastest only averaged about 32 miles an hour. No doubt the weight question had a great deal to do with this, every manufacturer having sacrificed everything to engine power. This is just what would happen over here were Mr. Arnott's suggestion adopted, and the advancement of the motor-bicycle, or perfecting of the engine, which really amounts to the same thing, would not be assisted in any way. My own belief is that, once a given capacity of engine is settled, or even the

The Steam Motor Dust Wagon lately supplied to the Corporation of Norwich by the Yorkshire Patent Steam Wagon Co., Leeds.

of boarding and some sacking, which brought the total weight of the machine within the limit specified. I was allowed to start as a tourist. A more absurd proceeding can hardly be imagined.

"In my opinion, now that motor-cycles are still very much open to improvements, the objects of races and trials should be to actually get at the efficiency of the engine. This is what we have to deal with. A strong bicycle is not much of a novelty to us now. Two ways of arriving at this result offer themselves. One is the cubic contents of the cylinder, or weight of the engine alone. Mr. Arnott's own arguments go to prove this. If, by raising the compression, increasing the weight of fly-wheels, etc., increased efficiency can be obtained—well, these matters have their limits, and it is only when a standard size of engine, as regards cubic contents of cylinder or weight of metal in the engine, shall be decided upon that the many minds now occupied with the subject will not be long in bringing the power to be obtained from either so much gas or so much metal to its rock bottom, giving us the most efficient engine that can be made. The high standard of efficiency now to be found in ordinary bicycles has been arrived at in a similar manner, i.e., the most possible had to be made of the one-man power at our disposal. My argument, therefore, is, bicycles we know, engines we have got to know as well. Surely this is worth striving for. Light bicycles, having powerful motors fitted to them, have already been the cause of, at least in one case to my knowledge, fatal accidents, and I cannot too strongly condemn the principle of offering any inducement whatever to foster the building of such machines. This, apart from the fact that a certain amount of comfort is not only desirable, but necessary, in a motor-bicycle, which comforts, of course, entail some little additional weight.

total weight of metal in an engine allowed, everyone will make the very best of the capacity or the material at his disposal, and the most efficient motor will result."

MOTOR-CAR ACCIDENTS.

At the Dublin Police-court on Saturday the charge against the Marquis of Downshire was withdrawn. It had been alleged that he had negligently managed his motor-car in Lower Dorset Street, Dublin, with the result that an old woman named Elizabeth Magee was knocked down and fatally injured. When the case was mentioned the Attorney-General's representative stated that investigations that had taken place had convinced the Crown authorities that the event which led to the old woman's death was an unavoidable accident.

"TREAT the matter as an ordinary street accident, and without any feeling which may be said to exist against motor-cars generally." That was the advice which Mr. J. C. Malcolm, the Leeds City Coroner, gave to the jury at the inquest in Leeds Town Hall on the body of John Alderson, who died in the Infirmary as a result of injuries he received by being knocked down by a motor-car driven by Mr. W. E. Nicholson, of Moorfield House, Headingley. Several witnesses testified to the fact that the car was being driven at a moderate rate, and after Mr. Nicholson had given his testimony to the same effect, the jury returned a verdict of "Accidental Death."

On Monday, Mr. Jetcham, coroner, held an inquiry at Brightwalton into the circumstances attending the death of Master C. C. Wroughton, aged thirteen, son of Mr. Wroughton, of Woolley Park, near Wantage. The

evidence showed that on Saturday the deceased, accompanied by the Rev. W. Boldero, of Newbury, left Woolley Park, both riding motor-cycles. Deceased rode in advance of Mr. Boldero, and on reaching the entrance to the town, where there was a junction of several roads, a collision suddenly took place between deceased's machine and a motor-car driven by Mr. E. B. Ormond, solicitor, of Wantage, who was proceeding at not more than four miles an hour. The result was that deceased and his machine were thrown under the motor-car, and he died shortly after. The jury returned a verdict of accidental death, and exonerated from blame all persons concerned.

ON THE FOOTPATH.

At Towcester, Felix Greville, Highgate, London, was summoned for riding a motor-bicycle along the footpath, at Towcester, on the 28th ult. Defendant did not appear. Service of the summons by affidavit having been proved, Police-constable W. Packer gave evidence to the effect that he saw defendant ride on the footpath for over 400 yards. Defendant readily gave his name and address, and he said that he rode on the footpath because the road was so dirty and he was afraid of his machine skidding. Fined 10s. and 6s. costs.

FURIOUS DRIVING CASES.

COUNT.	DEFENDANT.	ALLEGED SPEED.	RESULT.
Leeds	F. E. Asquith, Leeds	20 m. p. h.	£5, etc.
Watlington... Oxon	W. L. Creyke, Oxford	—	£10, etc.
Blofield ... (Norfolk)	H. Ellis, Burlingham	18 m. p. h.	£1.
Hove	S. Daver, Battersea	37 m. p. h.	£1, etc.

Where no alleged speed is given it is understood to be above the legal limit.
* Motor-Cycle Cases.

IN the case against Mr. Creyke, Superintendent Cooke handed in a statement showing four previous convictions.

THE case against Mr. Knettner was adjourned at defendant's request, owing to his wedding necessitating his attendance elsewhere.

JOHN HERSLER, motor-car driver to Earl de Wilton, of Buckenham Hall, West Tofts, was summoned at Brandon Petty Sessions, for driving a motor-car at an excessive speed, on the Thetford road, Brandon, on March 14th. Sarah Edwards stated that one of her children was in peril of its life, and as the car came up another child pulled her child out of the way. A toy horse was broken by the car. She did not hear a horn. Inspector Reeve informed the magistrates that on the same evening he cautioned defendant in passing the Town Bridge. The Bench found he had been fined once before for a similar offence, and now he was fined £3 5s., and costs, 15s.

THE STORAGE OF PETROL.

THE Graphic Motor and Engineering Company, Limited, of Blenheim Grove, Peckham, has been summoned at Lambeth by the London County Council for contravening the regulation under the Locomotives on Highways Act, which prohibits the storage of petroleum on premises where

persons assemble. For the defence it was stated that it was impossible to carry out the repair of motors without having some petrol upon the premises. If the contention of the Council were correct it would seem to lead to the conclusion that petrol could not even be kept in the tank of a car if it were in a workshop. The magistrate said that without wishing to do anything detrimental to the motor industry, he thought there was not the slightest defence to the summons. It was not necessary, however, in this case to inflict anything more than a nominal penalty of 20s.

At Wolverhampton the Star Engineering Company have been charged with an offence under the Petroleum Act. It was stated that the defendants, without a license, kept 200 odd gallons of petrol in a corrugated building within eighteen feet of a store-room. A fine of £10 and costs was imposed.

POLICE TRAPS.

THERE is a measured mile on the Chichester and Selsey road.

A POLICE trap has been established on the Brighton Road between Albourne and the bottom of Dale Hill.

It is reported that the police authorities of Waterford are measuring the main streets of the town as the first step towards adding to the local revenue by the fining of motorists.

THERE is a telephone trap between Lyndhurst, in the New Forest, and Totton, Southampton.

Owing to complaints having been made as to the furious driving of motorists along the level road approaching the Caerleon Bridge, a Monmouthshire county inspector and a constable were on Sunday stationed on the bridge. Strange to say, contrary to recent experience on Sundays, only one car passed that way. This the inspector stopped, and the owner's name and address were taken for alleged furious driving.

At Southwick, the Sussex police have a measured distance, and between Shoreham and Kington-by-Sea they have been very watchful of late.

On the Norfolk roads policemen on bicycles are now engaged in the pursuit and capture of motorists travelling at "forty miles an hour," etc.

THE MOTORIST'S SOLILOQUY.

MR. R. MOFFATT FORD has received the following lines, written, with apologies to the late Prince of Denmark:—

To stop, or not to stop; that is the question.
Whether 'tis wiser for a guiltless driver
To halt, when ordered by officious sergeants,
Or to protect himself from future trouble
By just ignoring them? To halt; to tip;
No more. And by a tip to say we stop
That summons for exceeding legal speed
That flesh is heir to! 'Tis a consummation
Devoutly to be wished. To halt—to tip—
To tip—and then be fined! Aye, there's the rub;
For in a court of law there are imposed
Such awful penalties on motorists
That give us pause. There's the respect
That makes us anxious to observe the law.
For who would bear the tedious procedure,
The sergeant's tales, his witness's untruths,
The quips of rural Bench, the mis-read law,
The insolence of office, and the spurns
The patient motorist from reporters takes,
When he could easily prevent them all
With his top speed? Why, who would ever stand
The weird decisions of the Reigate Bench,
But that the dread of something worse than this—
The numbering scheme to label every car
And give the police more scope, puzzles the will,
And makes us rather forbear those ills we have,
Than fly to others that we know not of?

COMMENTS.

Under which Flag?

AMONG the incidental problems associated with the Rise and Progress of Automobilmism are the relations existing between one trade and another. At one time the question was frequently discussed as to whether engineers or coach-builders should develop the motor-car business; and that question is settling itself in a rational way. Now the matter has come to the front again, and at Glasgow there is a dispute between operative coachbuilders and working cabinetmakers as to which of the two shall participate in the prosperity of the motor-car. The former complain that the latter are making motor-car bodies in violation of trade union principles. For the cabinetmakers it is argued that the manufacture of motor-car bodies is a new industry, and that they are entitled to do the work at the request of their employers. Neither party will yield, and so the dispute has been referred to the Glasgow Trade Council. It is a nice point, with the preference of most people for the coachbuilders.

Volunteers.

VOLUNTEERS are as varied as the scenes that break upon motorists in the course of a fair day's journey. Ordinary infantry and mounted volunteers have long been familiar; the Motor Volunteer Corps, under Lieut.-Colonel Mayhew, is being given shape and form; and now comes news of the Balloon Volunteer Corps, which Mr. Frank H. Butler has in hand. It is suggested that the proposed unit would be attached to the Motor Volunteer Corps, and would undertake duties somewhat similar to that carried on by the ballooning section of the Royal Engineers. They propose to operate captive and free balloons, motor balloons, and air-ships. Probably the next innovation will be a Marine Volunteer Corps, consisting of motor-boat owners. Even then, we doubt whether adventuresome spirits will be content, and, like Alexander, they will probably sigh for more worlds to conquer.

The Oxford Club.

ON Dashiwood Hill the Oxford and District Automobile Club has been holding a hill-climbing competition, the leading times in which are given on another page. There were three classes, one for motor-cycles, another for cars not exceeding £300 in value, and the third for cars catalogued at over £300. Each motor-cycle received a time allowance of four seconds for each quarter h.p. below 3-h.p., but twenty seconds was added to the time of any bicycle assisted up the hill by the pedals. There was no handicap for class two, and the handicap for class three was sealed. A prize, value £1, was offered for the winner in each class, and a handsome silver bowl (presented by Mr. W. L. Creyke in the name of the Club) was offered to the owner of the car or bicycle climbing the hill in the fastest time, and two attempts were allowed to each car or cycle. The journey

from Oxford to the Hill was without incident, and the road was in excellent condition. After the trials the members returned through Stokenchurch to the Lambert Arms, Aston Rowant, where tea was enjoyed, and the journey home was resumed at leisure. Altogether the competition must be considered an entire success.

Progress at Eastbourne.

THE motor omnibus of the Milnes-Daimler type, for experimental service in Eastbourne, has had its first trip, the passengers including Councillor Maude, the chairman of the Electric Lighting Committee, Mr. J. K. Brydges, borough electrical engineer, occupying the box seat. A start was made from Gildridge Road at 10.20 a.m., and within a few minutes some disparaging remarks were heard concerning the state of the road, so that the vehicle thus early demonstrated its capacity of revealing abuses to be remedied in the future by an enterprising Corporation. It finished its journey at the Pilot Inn at 10.35 p.m. The return trip was made in eight minutes. With regard to the earning power of motor-buses in Eastbourne, everything will of course depend on the business acumen of the authorities. The earnings of the motor-bus at Hastings average about £9 a day; the conveyance carries fourteen inside passengers, sixteen on the roof, and two in front, total thirty-two. The smaller bus now running at Eastbourne can earn about £5 a day, travelling to Meads and back fifteen times. The consumption of petrol averages about eight gallons a day, and a splendid start has been made.

Unattended Horses.

SUPPLEMENTARY to the prominence given in this issue with regard to unattended horses, we would mention a case at Witham, in Essex, in which a builder pleaded guilty to leaving a horse and cart unattended at Rivenhall. Police-constable Crowe stated that as he was in his garden the horse, which was running away, came past his place, and he jumped "over the garden wall" and stopped it. It was startled outside the Fox Inn by Dr. Salter's motor-car. Dr. Salter wanted to know why the defendant was singled out for prosecution, as there were several carts unattended standing near the inn, to which Superintendent Harrington replied that defendant was proceeded against as his horse was running away. He was fined 5s. and costs 4s.

Guns and Automobiles.

THE annual general meeting of the Hotchkiss Ordnance Company was held under the chairmanship of Mr. Charles F. Parsons, who stated that the American Ordnance Company had been absorbed by the American and British Manufacturing Company, in which the company had received ordinary shares to the nominal value of £17,080 in place of the original shares. Dealing with the general business of the company, he said the directors were disappointed with the results of their efforts to improve the business. There was no reason why

the company should not seek in other directions to augment its business and profits, and the directors had decided to take up the manufacture of automobiles. In order to test their capacity for production they first laid themselves out to execute the machinery work of automobile parts for other companies. Then they decided to commence manufacture, and six machines were now being made at St. Denis; and it was expected that one or more of them would take part in the Paris-Madrid race shortly to be held. To manufacture in quantity necessitated capital, and the directors desired the shareholders to appoint a committee to confer with them on this point.

The Scottish Club.

THE annual general meeting of the Scottish Automobile Club was held in the Dreadnought Hotel, Callender, on Saturday. There was a splendid gathering of the Club membership, a representative company travelling from Edinburgh and Glasgow, while from other parts of Scotland there was an excellent attendance. From Edinburgh the route lay by Linlithgow, Falkirk, Stirling and Doune, a distance of fifty-two miles, while from Glasgow the distance was just ten miles less, the line from the western metropolis lying through Cumbernauld and Denny, past the historical battlefield of Bannockburn, and

Mr. George Macmillan, the Hon. Sec. of the Eastern Section of the S.A.C., on his 16-h.p. De Dietrich Car.

THE MEET OF THE SCOTTISH AUTOMOBILE CLUB AT CALLENDER.

thence by Stirling and Doune to the meeting-place. The cars were due at half-past one, but an hour and a half earlier Mr. George Macmillan, on his new 16-h.p. De Dietrich, sped up to the hotel entrance. He accomplished the journey from Edinburgh in exactly two hours, which is good travelling considering the very undulating nature of the roads. The railway journey from Edinburgh to Callender usually exceeds two hours, and the fastest train of the day does it in one hour and forty-five minutes. The roads were excellent, the weather fine, and in every way the run north was enjoyed. Luncheon was partaken of in the Dreadnought Hotel, at which over 250 members and their guests sat down. After the successful annual meeting the return journey to the respective destinations was entered upon, and, as in the morning, the weather continued splendid until the close of the day.

The Annual Meeting.

THE business meeting was held immediately after the luncheon. Mr. Norman Macdonald, chairman, presided. The report stated that the sections were now fully organised, and that the membership was about 210. The affairs were in a thoroughly sound financial state, the Eastern section having a balance of £37 and the Western section one of £123. The General Council have arranged a hill-climbing contest

for May 23rd, and the Western section a non-stop trial from London to Glasgow and a 100-miles non-stop trial. The following representatives were elected to the General Council:— Western section: Messrs. H. M. Napier, W. H. Kingsburgh, and James Burns, with Mr. John Adam as chairman and Mr. Robert J. Smith as hon. secretary ex-officio; and by the Eastern section: Dr. Wm. Blair, Mr. Stephen Smith and Mr. John Wilson, with Mr. John Macdonald chairman, and Mr. George Macmillan hon. secretary, ex-officio. The following additional ten members were elected to the Council: Messrs. J. H. Irons, H. Prosser, W. L. Sleigh, Dr. Dawson Turner, Wm. Weir, Norman Macdonald, J. M. Ross, J. H. Parsons, Jas. R. Nesbit, and Talbot Crosbie. Among those present was the Comte de Clercq, member of the Technical Committee of the Automobile Club de France, who was a passenger on Mr. F. Lobnitz's 10-h.p. Argyll.

Officers for Motor Corps.

MAJOR-GENERAL OLIPHANT, commanding the Home District, has approved of the following appointments to the newly-formed Volunteer Motor Corps:—To be Majors: Honorary Colonel R. C. Knox, lately commanding 5th Battalion Irish Regiment; Mr. W. G. Windham; Honorary Lieutenant-

The Cars at the Dreadnought, Callender.

Colonel H. H. P. Eden, late 3rd Battalion Norfolk Regiment, and Mr. N. H. Balfour. To be Captains: The Honourable C. S. Rolls; Mr. J. P. Hammond; Major A. H. Lee, late R.A.; Mr. T. E. Polden, and Mr. W. J. Crampton. To be Lieutenants: Mr. H. Norman and Mr. J. E. Hutton. To be second Lieutenant: Mr. H. P. Trippell, from the 1st Surrey Rifles.

Questions in Parliament.

In the House of Commons Mr. C. Wason has inquired upon what grounds the proceedings against the Marquis of Downshire for so driving his motor-car as to cause the death of a woman were withdrawn in the Dublin Police-court. The Attorney-General for Ireland explained that the solicitor who appeared for the next-of-kin stated in court that he was convinced that the occurrence was accidental, and the police magistrate approved of the course that was taken. Mr. Long, in reply to a further question by Mr. C. Wason, said that the collision between a motor-cycle ridden by a boy and a motor-car at Wantage, by which the boy was killed, did not seem to call for any action, especially as the motor-car was going at not more than four miles an hour at the time of the accident. General Laurie asked the Home Secretary whether an omnibus driver was sentenced on the 17th inst. to a month's imprisonment, with

hard labour, for driving at a speed of ten miles an hour in the streets; and whether he would instruct the police to take similar proceedings against the drivers of motor-cars who might drive vehicles at the same speed. Mr. Cochrane, who replied, explained that the driver was convicted under the enactment in the London Hackney Carriage Act of 1843, which renders the driver of a stage carriage liable to punishment for "wanton or furious driving." There was a similar enactment in the Light Locomotives Act of 1896 with regard to motor-cars, and the police had instructions to take action against drivers of any motor-cars, as of other vehicles, which might be driven to the common danger, whether the speed was greater or less than twelve miles an hour.

AMONG the interesting articles in the recent magazines is one by the Rev. John M. Bacon, in the *Contemporary Review*, in which the Mechanism of the Air is dealt with. The atmosphere, at least up to an altitude of a few thousand

In the Air.

feet, is, with respect to temperature, as it is with respect to motion, "variable and irregular beyond what has been anticipated." Dr. Benson, ascending from the Crystal Palace during the continuance of hot weather with cloudless skies in the summer of 1898, recorded, at 27,000 feet altitude, a temperature of 29 degs. below zero, which was more than 20 degs. lower than had ever been registered by balloons at the same height—mentioned by the writer of the *Contemporary* article as a convincing proof of the inefficiency of older instruments. Regarding the air as rising only in slender streams and bubbles, he points out that this should point to the scrupulous observance of the most obvious laws of ventilation, one of which is the cutting away of all overhanging trees or creepers—a suggestion somewhat contrary to the practice of many local authorities in planting trees along the side-walks.

Oil for Petrol Motor Cooling.

UNLESS extreme care is taken, there is great danger, in severe frosty weather, of the water employed for the cooling of the motor freezing, the result being, as many motorists know to their cost, cracked cylinders. In this connection a correspondent writes that the Hart-Parr Company, Charles City, Iowa, are using oil for cooling the cylinders of their engines. The oil is sealed air tight in a radiator and the jacket of the motor. They claim that they have used this system for the past five years with perfect success, and that the oil they furnish for cooling purposes should last as long as the engine itself, and that it does not freeze. Commenting on this in the "Cycle and Motor Trades Journal," Mr. C. E. Duryea remarks that any liquid that will not freeze, or which when it freezes does not expand, should be suitable for motor cooling purposes in wintry weather. A solution of water and sugar, for example, is far less likely to burst a cylinder by freezing than water alone, for it freezes at a lower point and expands less when freezing. We are endeavouring to obtain some further information regarding the use of oil for cooling purposes, and if necessary will return to the matter in a later issue.

India and Automobiles.

THE Indian Government is considering the whole question of regulations with regard to the import and storage of petrol, and also the speed of motor-cars throughout the great Dependency. Recently an American importer has been in Bombay, where he has had a dozen natives trained to drive petrol cars, and the fact that no dangers have occurred has doubtless done something to reassure the public mind as to the safety of the modern automobile. There is, no doubt, a great future for the motor-car in India, the heat making horses practically prohibitive in most districts, and the locomotion by bullocks being extremely unsatisfactory. Hence it is to be hoped

that the Indian Government will not only come to a right conclusion, but that they will come to it as speedily as possible.

The Eastern Counties Club.

A MEETING of the Eastern Counties' Automobile Club has been held at Ipswich, when it was agreed that all hon. secretaries of county clubs should be made hon. members of the Club. In the badge the features of the East Anglian flag will be introduced. On the question of affiliation with the A.C.G.B.I. it was resolved that the Club would not consent if a greater fee than five shillings per member were demanded. An effort is to be made to secure members in the leading centres, like Bury,

An 8-h.p. M.M.C. Car ascending Nethrall Gardens, Hampstead, which has a gradient of 1 in 5.

Cambridge, and Wisbech, and six gentlemen have been elected as additional members of the committee.

Revising the Poets.

WILL our standard authors have to be revised now that automobilism has become as great a factor in our national life as horse-owning? This is a problem that has formed the subject of a newspaper article in the United States, where live "copy" seems less plentiful than on this side of the Atlantic. Shakespeare had many references to the horse in his plays and would present considerable difficulties to the reviser. Our *Transatlantic confrere* suggests that Shakespeare's lines—

"Anger is like
A full hot horse, who, being allowed his way,
Self-mettle tires him,"

should be altered to read—

"Anger is like
A leaky wheel, which, being allowed to run,
Soon has to be re-tired.

Tennyson would present many perplexities to any but the most ingenious Bowdleriser, but again the knotty problem is got over in the lines—

"He will hold thee, when his passion shall have spent its novel force,
Something better than his dog, a little dearer than his horse,"

being varied to—

"He will hold thee in the future, when less passion he doth feel,
Something better than his dog, not so perfect as an automobile.

This may be fine fooling to fill a column, but why should only English poets be selected wherewith to display such a roving fancy?

The Burnley Club.

THE members of the Burnley and District Automobile Club had their opening run for the season on Saturday last, the destination being Skipton. The weather was all that could be desired, and eight cars put in an appearance, each with its full complement of passengers, making

a total of thirty-three persons, who sat down to tea provided at the Midland Hotel. The following members with their cars attended. Mr. Jesse Altham (7-h.p. Turrell), Mr. C. Atkinson (7-h.p. New Orleans), Mr. Bellingham (7-h.p. Turrell), Mr. J. Butterworth (treasurer) (7-h.p. Turrell), Mr. Cooper (Argyll), Mr. Hargreaves (4½-h.p. Renault), Mr. Parkinson (7-h.p. Turrell), Mr. Harold Smith (8-h.p. Argyll), Mr. Smith also sent a 7-h.p. Turrell, and Mr. Watts a 8-h.p. Argyll. The run was successfully accomplished by all the cars, with the exception of Mr. Hargreaves (who had to complete his journey by train in consequence of tyre troubles), arriving at the destination without a hitch. Mr. P. H. Altham has resigned the secretaryship, and that office has been accepted by Mr. Smith Lawson, solicitor, of Burnley.

In The Transition State.

THE announcement that the Panhard and Levassor representative in England intends to keep a watchful eye on likely infringements on the firm's patents would seem to presage further litigation. But in an industry in such a transition state as is the motor-car business the value of patents is quite a problematical matter. Patterns are changing, improvements are being so rapidly introduced, that the features of one year are the curiosities of the next. Until something like a standard practice has been evolved, nothing like certainty in the matter can be expected.

A Club for Surrey.

A MEETING was held on Tuesday at the Angel Hotel, Guildford, to form a West Surrey Automobile Club. Colonel Fairtlough was elected to the chair. Fifteen gentlemen were present, and twenty members in all gave their adhesion to the project. A provisional committee, consisting of Rev. A. Armitage (secretary), Messrs. R. W. Buttemer, Baring-Gould Brothers, Captain Rouse, Ponsford, and Colonel Fairtlough were elected to consider the rules and proceed with the formation of the Club, which should prove useful in uniting the motorists of Surrey against their common enemy.

"Beginners."

THE last of the Tuesday night meetings of this season has just been held by the Automobile Club of America. The evening was devoted to informal talk, and the chairman, Mr. W. E. Scarritt, proposed the topic of "Beginners; or, How to Learn to Operate an Automobile." Mr. Scarritt said the thing of most importance was to learn how to stop quickly, and by constant repetition of the formula. "What shall I do to stop?" together with practice in stopping, to so associate the thought with the action that when an emergency arises there will be perfect co-ordination, and the car at the thought of "stop" will be brought up instantly without bungling and almost unconsciously. Mr. E. B. Gallaher spoke also of the over-use of the horn and the danger of confusing persons by tooting it so that it was more difficult then to pass them than it was to steer around them in silence. In France, he said, the use of the horn is one of the points that count in examining a *chauffeur* for competency. If a man uses his horn frequently he is considered to lack mastery and confidence.

Breach of Horse Warranty.

SOME folks seem to see an incongruity in the presence of the automobile on the hunting field. Others regretfully acknowledge that their mounts shy at cars. In this, however, they have their remedy, for a case was recently heard at the Norwich County Court in which damages for breach of warranty of a pony were obtained because the animal shied at the electric tramway-cars in Norwich. Huntsmen and others should have some assurance, when purchasing horses, that they are not

likely to conduct themselves ill-manneredly in presence of the inevitable, i.e., the automobile.

At Banbury.

MOTORISTS as a rule are not the most restful of folks, and therefore the wet day at Banbury on Sunday last seemed somewhat long to those who had indulged in the trials reported on another page. In the morning, at breakfast time, good resolutions were made to "nap" in the afternoon, but, except in rare instances, these were not kept. Breakfast was mostly taken late, Messrs. Johnson, Orde, and Joy busied on the statistics, Mr. Napier worked on Mr. Hutton's Mercedes, while others engaged on their tyres, which seemed to need general attention, most of them having collapsed in the night. In the words of the poet—

"To Banbury came i o profaine one,
Where I saw a puritaine one,
Hanging of his cat on Monday,
For killing of a mouse on Sunday."

Numbering Again.

MAJOR K. BALFOUR, M.P., has given notice of the following motion in the House of Commons:—"That in the opinion of this House the time has now arrived when legislation should be initiated providing for the conspicuous identification of motor-cars, the licensing of persons who receive pecuniary remuneration for driving the same, the licences to be subject to endorsement or suspension for repeated offences, and the abolition of the specific speed limit."

Fire at the Daimler Works.

ON the morning of Thursday, the 30th ult., a serious fire occurred at the Daimler Motor Company's Works, Coventry. The outbreak was discovered in the finishing department, where a number of valuable cars were being completed. The fire spread with great rapidity despite the firemen's efforts, and the shop was completely gutted, the cars being totally destroyed. The damage amounts to several thousand pounds. The cause of the fire is unknown. Fortunately the prompt action of the firemen prevented the fire spreading to other departments, and the damage is covered by insurance.

THE North Eastern Railway have three 24-h.p. Stirling motor-omnibuses on order.

PARTICULARS of the quarterly 100 miles non-stop trial of the A.C.G.B.I. will be given in our next issue.

SEVERAL motor-cars have been chartered in connection with the Stock Exchange's walking match to Brighton.

THE Beaufort Motor Company have had a fire at their works, resulting in the destruction of about fifty car bodies.

THREE Arrol-Johnston cars were entered for the 100 miles trial of the Western Section of the Scottish Automobile Club.

THE rule limiting the machine in the forthcoming motor-cycle trials to 3 h.p. has been rescinded and a limit of weight to 170 lbs. substituted.

SOME members of the A.C.G.B.I. will meet the magistrates and chief constable of Hertfordshire at luncheon on the 28th inst., by invitation of the Mayor of Hertford.

THE decision of the Parisian magistrates to sentence Baron Henri de Rothschild to a day's imprisonment and a fine of 4s. 2d., for driving beyond the regulation speed, has been upheld by the higher courts.

RECOGNISING the difficulty experienced by motorists in getting a thoroughly efficient spirit for motive power, Messrs. S. Bowley and Son, of the Wellington Works, Battersea Bridge, S.W., are distilling a motor spirit with a specific gravity of .680,

The Gordon Bennett Eliminating Trials at Clipstone.

Three of the Cars—Messrs. Stocks and Mayhew on "Napiers," and Mr. J. Lisle, Jun., on the "Star."

[Argent Archer.

THURSDAY evening of last week found self and party at the Midland Hotel, Derby, *en route* for Mansfield, after a pleasant, albeit dusty journey from London. While waiting for dinner a message was brought, that a Mr. Beresford wanted to see the writer. This seemed strange, as it was only by accident a stay was being made in the hotel. Granting the interview as desired, we learned that a cyclist, a few miles from Derby, had to get off his machine because he thought our Mercedes car had been travelling too fast. As a citizen, he felt it his bounden duty to complain to the police, which he did then and there. The result was that a police-constable had called to hear what we had to say on the subject, and to inquire for name and address. The identity of the place where the cyclist had dismounted was somewhat difficult to locate, as in a journey of 130 miles a number of towns and villages are passed through. However, we found this particular cyclist had dismounted somewhere between Loughborough and Derby. So far as we were concerned, we anticipated the inevitable, and concluded the incident for the present was ended, but the next morning, however, another visitor called—this time an inspector from Loughborough. His errand was the same as the earlier caller, and developments are now being awaited.

Friday broke forth in full sunshine, and the short journey to Mansfield—although the road for a few miles was very circuitous—was much enjoyed, the latter part being straight and without traffic—an ideal road, we should imagine, for testing high-speed cars. The headquarters of the competitors was at the Swan, a comfortable old-fashioned inn, and here we soon found Mr. E. Lisle, in whose company we journeyed to Clipstone Park to see the Napiers being tested for the course, which was in a somewhat gritty condition. In the afternoon we had the

pleasure of riding out to Welbeck—this time on the Star car, and some hours were spent in watching various competitors passing up and down the course. Apparently one of the Napiers was travelling very fast, but the Star car was not going slow, and it seemed she was pulling very finely. However, on the Saturday she certainly seemed slower, this perhaps owing to the fact that Mr. J. Lisle, who drove, was suffering somewhat acutely from rheumatism.

The evening was spent in giving a final look round the cars, and early to bed was the rule. There had been some anxiety in the afternoon about the weather, which looked threatening, but all fears were dissipated on the Saturday morning by the brilliant sunshine and beautiful blue sky. All were early risers, as indeed motorists generally are, and by 9 a.m. horse-drawn vehicles and motor-cars began passing through Mansfield, making for the trial ground. By 10 a.m. the town was full, and the roads, with the endless procession of vehicles, reminded us of the old Derby Days, before it became fashionable to visit Epsom by train. The dust from the traffic was tremendous, and the ladies in their smart costumes arrived on the course mostly covered in dust—some of which was caused, we are afraid, by the inconsiderate driving of a few of the motorists. The distance of the course from the town was only about four miles. Lines of vehicles were continually going at a pace of about four to six miles an hour, but this apparently did not suit some of our friends, and they dashed by, raising clouds of dust.

Taking up our position behind the hedges in one of the fields about half-way down the kilometre course, some little leisure was possible, and most interesting was the scene. The various cars manœuvring in position; the horses, becoming friendly and apparently satisfied, were sandwiched in between

the automobiles. Notwithstanding the fact that there must have been at least two hundred cars present, besides a large number of carriages and other vehicles, there was ample room, and the picture was a most animated one.

At 10.30 a.m. the constables, of whom there were a large number, and who performed their duties to the entire satisfaction of the competitors, officials, and spectators alike, were given flags (the old 1,000-Mile Trial flags) to clear the course, which instructions were promptly carried out. Then came a long wait, enlivened just before 11 a.m. by Mr. Rolls taking a flying run down the course. It was a minute or two to twelve when the first of the trials commenced, the car being driven by Mr. Rolls. Experts did not seem to think the speed was very fast, but in this, as figures will show, they were mistaken. The other cars in the order named passed by in equally quick succession, driven by Mr. Stocks, Mr. Mayhew, and Mr. Lisle, the order of running having been determined by ballot.

And so the cars passed and repassed till 1.30, when a short interval was allowed. The spectators, however, in the meantime,

in any event being taken as zero, and the time occupied in excess of the fastest time being shown :—

The "Star" Car making for the Course.

[Argent Archer.

had had their appetites whetted with the beautiful and clear air, and had already picnicked in the meadows.

To attempt to mention the names of all the notabilities and members of the various automobile clubs present would take up too much space, but the gathering was one of the most noteworthy in the annals of British automobilism. The officials, one and all, worked harmoniously, and all the arrangements were carried through very successfully. There were about eighty members of the A.C.G.B.I., including the Lord Chief Justice Clerk of Scotland, the Hon. J. Scott-Montagu, M.P., Sir Hickman Bacon, Bart., Mr. C. Shaw, M.P., Mr. E. Kennard, J.P., Mr. H. Norman, M.P., Mr. C. Johnson, Mr. Basil Joy, and Mr. J. W. Orde. Wolverhampton motorists were represented by Mr. S. K. Rhodes, hon. secretary, Messrs. F. Bishop, T. Lisle, Trevor Young, C. Perry, W. Owen Shacklock, and others. The Duke of Portland visited the course on his Lanchester car. The Sheffield Club was well represented; from the Yorkshire Club were Messrs. A. W. Dougill, A. Jones, and D. Hey, with Mr. L. Hey on his 24-h.p. Spyker car; Mr. G. H. Kirk and Mr. Smith on a 12-h.p. Napier; Messrs. Greenwood, Borland, Booth, Bayliss, and others. The results of the trials were as follows, the fastest time

cars had to proceed to Banbury, a distance of over 100 miles, and to be ready at the White Lion in that town at midnight on Sunday, for the purpose of testing the cars on a hill, which was not to be known until that hour. For ourselves, we arranged to stay at Leamington, and so proceeded to Nottingham, where the run commenced. Here some time was spent in endeavouring to purchase a "garter" for one of our tyres, but in this we were unsuccessful, and so left for Leicester, where a halt was made for refreshments. The weather had turned chilly, and the rain was spitefully pelting in our faces as we started for Rugby. Other cars were on the road, all proceeding cautiously; Mr. Stocks' Napier being immediately in our rear. Unfortunately a wrong turning was taken, and shortly afterwards the off-side tyre burst, causing us to collide with a telegraph pole, and afterwards to subside gracefully, if somewhat violently, into a ditch, when another tyre went off with a loud report. The three ladies in the tonneau, Mrs. Cordingley, Miss Pursehouse, and Miss Lisle, though greatly shaken, showed no signs of alarm, and after a moment or two we were all congratulating ourselves that no very serious results had happened. Efforts to obtain a team of horses having failed, it was decided to leave the car, and find an inn; but a carriage passing, and learning

from the driver that the distance from Rugby was only five miles, we took advantage of the kind offer of assistance and drove to the Royal George Hotel, leaving our mechanic in charge. After a hearty supper, preparatory for retiring for the night, Mr. Mayhew drove up to the hotel on his Napier, and never having had a ride on one of these cars we were glad of a seat for the remainder of the journey to Banbury, which town was reached some time after midnight. About a dozen motorists were there assembled, including Messrs. Jarrott, Edge, Stocks, Hutton, Ochs, Napier, etc.

Sunday was a most dismal day, and the rain continued without intermission. By the aid of telephones and telegrams it was early ascertained our car would most probably be able to reach Banbury some time in the late afternoon, and this good news was confirmed by Mr. Lisle on his arrival with the Star. As a matter of fact it was 9 o'clock before the car arrived, and then with the tyre badly down. However, a good Samaritan was found in Mr. Edge, and with the best wishes for assistance from other friends present we were able to make a start for Dashwood Hill, where the test hill climb was to be held, a minute or two before midnight. Mr. Mayhew's car soon passed us, the Star having caught us up. We continued in company to the foot of the hill, where Mr. Mayhew was waiting. Coming up just over the brow of the hill was another car. The lights presented a strange appearance in the half dawn. Hurrying into High Wycombe, where two policemen helped us to wake up the boots at the hotel, we astonished that gentleman with an order for to have ready about twenty-five breakfasts at 5.30 a.m. Some persuasion had to be exercised, and somewhat dubiously was the order undertaken. On our return to the foot of Dashwood Hill all was ready for the trials, and here our party was joined by Messrs. Harvey du Cros, jun., Sangster, and Jarrott, who had journeyed by cars from town. The hill was heavy and wet, and in the cold grey dawn the trials did not take very long. The results were tabulated as follows:—

	HILL CLIMB.					
Rolls	6.4	..	4.0	0
Stocks	5.4	..	0	27.0
Mayhew	23.4	..	1	1.2
Lisle	30	..	25.1	23

The whole of the trials of selection worked out on this basis show that Mr. Stocks was faster than Mr. Rolls by 50 1-5 seconds; faster than Mr. Mayhew by 2 min. 19 sec.; and faster than Mr. Lisle by 3 min. 22 sec.

At 5.30 a.m. there was a hungry party, numbering forty, seated patiently in the coffee-room awaiting breakfast. Plentifully and graciously had our orders been fulfilled, and ample food was supplied to the hungry, tired, moist motorists, for the rain had persevered since Sunday morning. We should like to state that all credit is due to the landlord for fulfilling such an order so satisfactorily, and at such a short notice. After breakfast a scamper for London was made, and this was reached about 8 in the morning, nearly everyone being fairly exhausted.

AN automobile club has just been formed at Gothenburg, Sweden.

A PUBLIC service of motor-cars has just been started between Cadiz and Algeciras, Spain.

A PUBLIC service of motor-cars is about to be inaugurated between Leipzig and Merseburg, Germany.

THE *Chambre Syndicale de l'Automobile de Belgique* will hold its next exhibition in the *Palais du Cinquantenaire*, Brussels, from the 23rd January to 4th February, 1904.

L'ASSOCIATION DE LA PRESSE TECHNIQUE, of Brussels, has just commenced the publication of an Index of the principal articles of the Technical Press devoted to engineering.

It is not necessary that a man shall be a good mechanic to successfully run a motor-car, but it is absolutely necessary that he should possess nerve and confidence, good eyes and ears, and a quick action.

SOME USEFUL NOTES.

IF, while on a run, the brakes are found not to hold properly, they should be attended to before anything serious happens from the lack of them. Perhaps the trouble is due only to oil having saturated the band, in which case it should be taken off and wiped with waste and the brake drum also cleaned. The difficulty may be only one of faulty adjustment, in which case a few moments' work with the wrenches will set the matter right.

It should not be forgotten that it is possible, as a last resort, to use the engine as a brake, if the brakes themselves refuse to work; and one should be prepared to act upon this information in an emergency. When running on the low gear, with the engine at lowest speed, the velocity of the car cannot become great, while a powerful brake is obtained by switching off the ignition.

AFTER spending a few hours overhauling a car the hands are naturally uncleanly, and it is suggested that rubbing finger tips across a piece of soap before beginning operations will prevent them becoming so difficult to clean at the end of the task. For removing the black greasy dirt associated with this work Sapon is being recommended by many motorists. A little of this powder placed on the hands, which should then be dipped into water, can be rubbed into a paste, and, with a little more water, into a cleansing lather.

WHEN running down hills, the descent should be made on the second speed, or even the first speed, if the hill is very dangerous. In this way the car cannot run away, and the brakes are reserved for any emergency. Of course ordinary hills can be descended with the engine running free. Never allow the car to get out of control, so that it can be stopped immediately if necessary. The brake power provided on the majority of cars is more than ample, but it should not be abused.

It is surprising how much use can be made of strong wire in temporary repair work when ingenuity is used. A cracked pipe, which has begun to leak badly, may be rendered tight enough to be usable, if tightly wound with adhesive tape and then with fine wire.

LEAKY threads in petrol pipes may be made tight if covered with common soap or even white lead, and if the water tanks develop cracks in the soldering and begin to leak excessively, caulking the crack with cloth, saturated with white lead, should be tried.

No matter how much care is bestowed upon a motor-car, defects are bound to occasionally develop in it while on the road, and it is then that the mechanical resources of the motorist are taxed to their utmost. His material resources are generally very limited, comprising the few tools and supplies which he can carry in the tool-box, together with whatever he can beg, borrow, or buy along the highway. His mental resources are drawn upon in proportion to his paucity of material aids. Despite the small space usually available, quite a number of useful tools and supplies may be carried upon the vehicle, and, if the contents of the tool-box be well selected, a great many emergencies can be successfully met.

In addition to the full set of wrenches, screwdriver, oil can and pump which are furnished with most cars, the following articles, among others, will be found helpful, and should be carried if space permits: A small pipe wrench, a file, a cold chisel, a pair of lineman's pliers, a good jack-knife, extra links for the chain, asbestos for engine joints, cotton waste, an extra supply of oil, a tube of white lead, a roll of adhesive tape, an extra pair of sparking plugs, spare nuts of all sizes and threads used upon the vehicle, a voltmeter, a coil of galvanized iron wire, and some insulated copper wire and fine steel wire. The above category may almost seem to constitute the "machine shop" which the detractors of automobiles claim has to be carried about with each car, but, as the automobilist cannot be expected to "make bricks without straw," the articles enumerated had better be carried if possible.

THE IRISH FORTNIGHT.

WE regret to hear that some motorists who are apparently without any consideration for the general welfare of the movement, have been rushing over the Gordon Bennett course at a speed altogether out of consonance with the feelings of the Irish people. According to Mr. M. J. Minch, M.P., motorists seem to have taken possession altogether of the roads between the Curragh and Maryborough, and between Kilcullen and Athy. He was one of the Irish Parliamentary party who approved and encouraged in every way the idea of the race taking place in Co. Kildare, so that his protest is not that of any prejudiced person. Only the other day, on the road between Athy and Timolin, he saw a man in serious danger with his horse and trap, owing to a motor-car coming up behind him at a speed of quite twenty-five miles an hour. Having in view the fact that Ireland has given every encouragement for the race, and that many of the county local authorities are going to considerable expense to prepare the roads, both on the course and on the route of the subsequent tour, we hope motorists will be careful not to do anything which may hamper the good feeling now prevailing in the Emerald Isle with regard to automobilism. The Athy Urban District Council is calling the attention of the police to

[Campbell and Gray.

THE ELIMINATING TRIALS AT CLIPSTONE.

the matter, and it is to be hoped that the nuisance will be speedily checked. Of course, these remarks do not in any way refer to the competitors or officials who have been going over the course; but in Ireland, as in England, it is the irresponsible motorist, who cares neither for his own safety nor for the regulations of the police, to whom these strictures have to be applied.

THE Swift Cycle Company, Limited, offer a "Swift" Royal bicycle to the person who correctly calculates the precise time occupied by the winner of the race. The results of calculations have to be sent to the company at Dublin not later than July 1st, marked "Gordon Bennett" Competition. For the purpose of regulating the priority of reception of the calculations they will be numbered consecutively as received or taken out of the letter-box, and the calculation bearing a lower number will be deemed to have been received before that bearing a higher number. In the event of no person correctly calculating the time the bicycle will be awarded to the person whose calculation most nearly approaches it.

THE route decided upon in connection with the motor-car service about to be established by the Earl of Leitrim, is via Letterkenny, Kilmacreevan, Milford, and Carrigart. As it would greatly add to the success of the service to prepare the

surface of the roads by steam-rolling, he has asked the county council for permission to use a roller or rollers for these roads. He also wished to be held indemnified against any breakages of pipes or bridges along the roads owing to steam-rolling. This request evoked a long discussion at the last meeting of the Council, which ultimately granted the permission, but refused to give any indemnity. The roads in the district are fairly hilly, the gradients between Letterkenny and Kilmacreevan being 1 in 16. To avoid a dangerous hill at Ramelton, the route is then taken to Milford and Carrigart—a total of about twenty-six miles.

THE Peerless Motor Car Company of Cleveland have built two machines for the Gordon Bennett race, one a 40-h.p. and the other an 80-h.p. The high-powered machine weighs about 2,200 pounds, which is the limit allowed by the racing rules, and the other weighs 300 or 400 pounds less. The 80-h.p. car has an exceedingly long wheel base and is equipped with 34-inch wood wheels and 4-inch tyres. It is the intention to take both of the machines to Ireland and test them there on some of the byroads to determine the relative speed on curves. If it should be found that the car with a small wheel base can safely be run considerably faster on the curves than the high-powered one, it may be used in the contest. The 80-h.p. engine has four cylinders, 6 inches bore by 6 inches stroke. The change gear

gives four speeds forward and one reverse, and is controlled by a single lever. The transmission to the rear axle is by bevel gear, and the drive is direct on the high speed. The petrol tank has a capacity of 40 gallons. The engine is fitted with automatic governor and accelerator.

CAMPING out is likely to be indulged in by many who go to Ireland to see the Gordon Bennett race. In fact, the committee of the Ulster Centre of the Motor Cycle Union of Ireland are entering into negotiations to secure a suitable position on the course for the location of tents for their members. In a later issue we propose to give some idea of what might be done in this direction.

MRS. MARY G. KENNARD, the popular novelist, has been for a trip on a Gordon Bennett racer, and sends us the following impressions: "The car belonged to Mr. Mayhew, and was made by the now celebrated firm of Napier. A long, rakish vehicle, the bonnet occupying quite half its length, two light seats, a wooden box at the rear, filled with tools, oil-cans, rags, etc. That was what met the inexperienced eye. But the practised motorist could not fail to admire the greyhound-like proportions of the flyer, the mechanical skill which could combine such lightness with so much strength, power, symmetry and good workmanship. One turn of the starting handle and the engines thundered out their music, readily, gleefully, as if longing for the fray, and far more respon-

sively than many a little $3\frac{1}{2}$ h.p. De Dion. I took my seat by Mr. Mayhew's side, and we were off. The first speed seemed fast; the second faster; the third breath-catching; the fourth terrific; no other word describes it. The wind-pressure was enormous as we tore through the air, and periodically the car leapt and bounded clear off the ground, and like a living thing conscious of its strength, playfully delighting in it. I glanced admiringly at my companion. It takes exceptional qualities, exceptional nerve, judgment, and experience for a man to steer such a car. He sat cool, crouched over the wheel, his goggled eyes fixed intently on the road, the stiff breeze blowing through the shaggy fur that he wore as a protection from the bitter April cold. I realised then what automobile racing really meant. The public sits at home and reads calmly of cars attaining a speed of eighty miles an hour, but until people actually ride in such a vehicle it is impossible for the pace to be brought home to the mind. The strain upon human nerve is enormous. One can understand men driving in two or three races, and emerging successfully from the ordeal; but can they go on doing so? Is not the tension too great, the effort too immense for man's courage to withstand a continuance thereof? I could not help asking myself that question."

NEWBRIDGE is an interesting little town on the road from Dublin to Ballyshannon, and those who wish to reach the starting-point of the Gordon Bennett Race by rail should alight at Newbridge, this being the nearest railway station to the cross-

At Fresco Entertainment on the Eliminating Contest Course.

roads. Motorists will be interested to know that Mr. M. T. Woods has facilities for repairing cars at his works in Edward Street, Newbridge, and is now adding to his plant. He has secured the services of a competent mechanic who has been foreman in one of the leading motor factories.

DURING the Irish fortnight Messrs. Selbach and Adams intend taking two 40-h.p. vehicles and three Regal light cars to Ireland.

MESSRS. JOHN HUTTON, SON AND CO. have made arrangements in Dublin for a garage for over 200 motor-cars. They will have a staff of mechanics constantly in their place at 115, Summer Hill, and any motorists going to Ireland can get a small repair done while they wait.

AT Naas good accommodation for visitors will be found, and as the town is only seven Irish miles from the starting point at Ballyshannon, and six miles from the Curragh of Kildare, many will spend the previous night at that place. At present, however, there is no facility for repairing cars at Naas.

THE COTTEREAU 16-H.P. CAR.

WE are this week able to give an illustration of the 16-h.p. wagonette, one of the latest productions of the Cottereau Company, of Dijon, the agents for whom in this country are Messrs. McNeil, Hutchison and Borth-

Fig. 1.—The Cottereau 16-h.p. Wagonette.

wick, of Manchester. The car, as will be seen, comprises all the latest features, including combined honeycomb water-tank and radiator. The motor, which is shown in Fig. 2, has four vertical cylinders, 92 mm. diameter by 120 mm. stroke, the normal speed being 900 revolutions per minute. Accumulator or magreto ignition can be fitted, the particular engine illustrated being provided with the latter. The governor acts on the inlet, the

Fig. 2.—The Cottereau 16-h.p. Motor.

connection being such that a quick action is obtained. The valves are mechanically operated, and are all interchangeable, the inlet valves being on one side and the exhaust valves on the other. The transmission is on the same lines as that adopted in the Panhard cars, four speeds and a reverse being available, the power on the top speed being transmitted direct. The car, which without body weighs about 16 cwt., can attain a speed of thirty-eight miles per hour on good roads.

POLICE ZEAL AND LAXITY.

IT would appear that the area of police activity is shifting from Surrey to the eastern counties, and that whilst those in the southern districts are adopting a little more straightforward methods than was the case last season, those of the eastern counties seem to be playing the part of imitators. During the last few weeks several cases of unfair treatment have been reported to us from Essex, where the magistrates apparently incite the police to bring as many motorists as possible before them. The anti-motor mania has now spread into Norfolk, and in connection with the recent inaugural run of the Norfolk Automobile Club, a good haul of motorists was made, the result being that about a dozen leading citizens of Norwich and the district were summoned at Blofield Petty Sessions on Monday, under the Light Locomotives Act of 1896.

Elsewhere we give the details of these cases, but we would point out some considerations which are of importance to

The Police Trap on the Yarmouth-Acle Road.

motorists generally. As will be seen from the above photographs of the incriminatory road, looking towards Acle, a few miles from Yarmouth, it is a long regular stretch of open roadway, with no cross-roads or houses to form a plea of public danger. The driver on this road can see straight ahead of him for some few miles, and certainly it would not appear to be a place where children or pedestrians were likely to loiter—even if no motor-cars were passing along. This safe stretch of country was just the point selected by the police on which to plan their trap. How this was done was described by a police-constable himself, and would appear, from the ordinary common-sense point of view, to afford hardly sufficient evidence on which to hang the proverbial dog. But, being only concerned with motorists, any sort of device would appear to be sufficient. The quarter of a mile was measured by the police pacing the distance; no question of exact measurement was involved, the mere stepping out of the policemen being sufficient. Instead of using properly-regulated stop watches, the police had ordinary time-keepers, and located themselves under the fence, where they could see the users of the road while the drivers could not see them. Such was the character of the trap in which a dozen respectable citizens were caught.

After hearing evidence as to speeds of anything from twenty miles per hour being attained, the magistrates retired to consider their verdict, but before doing so, Mr. George Chamberlin, chairman of the Norfolk Automobile Club, addressed them, pointing out that the Club would never run in an unsportsmanlike manner or to the danger of his Majesty's subjects. Such an assurance, together with the fact of the unsatisfactory character of the evidence upon which the police based the issue of the summonses,

should have deterred the Bench from dealing severely with the matter. In two cases where the police evidence was too preposterous even to the satisfaction of country magistrates, dismissals resulted, but in the others fines and costs have had to be paid. One amusing feature of the evidence was that of Mr. Havers, a Norwich architect, who measured the constable's quarter of a mile and found it twelve yards short.

While the police were thus busy in securing convictions against motorists for riding across the flat road on the marshes, they were sadly neglecting their duty in the same district, so far as unattended horses and vehicles were concerned. There is no need to emphasise the danger to the public that attaches to the leaving of horses and vehicles outside inns and other places, whenever any other traffic is passing along. The accompanying photograph shows a view of the Globe Inn at Blofield, taken on Wednesday week, when there were no less than nine unattended horses standing there at one time. Blofield is on the same road as that where the police trap was laid, being a little nearer Norwich. The petty sessions for the division are held at this inn, and we should have thought that the police would have con-

Unattended Horses at the "Globe" Inn, Blofield.

sidered the duty lying nearer home than to have troubled about the solitary road whereon they trapped motorists. But it is very evident that in many districts they are disposed to take a very lax view of their duty so far as horses and their drivers are concerned, while their undue zeal when trapping motorists is by no means to their credit. There is no doubt that public men in rural districts can do much to assist the automobile movement by urging that the police should perform their legitimate work in carrying out the law with impartiality and common sense. There is the suspicion in many quarters that they are prejudiced with regard to motorists, and that the magistrates often foster such a spirit instead of rebuking it when suitable opportunities offer.

THE Bavarian Automobile Club of Munich is organising an "Automobile Day" for the 5th July next.

THE Leicestershire Automobile Club has just had its first run of the season, the destination being Ashby-de-la-Zouch.

JUDGE ADAMS, the county court judge at Limerick, has described the motor-car as "the greatest curse known since the first batch of English who landed in Ireland."

MESSRS. SOUAMI AND COMPANY, LIMITED, has been registered with a capital of £4,000, to adopt an agreement with Mr. L. J. Souami, and to take over the business of a veneer merchant and manufacturer of and dealer in motor-cars now carried on by him at 372, Old Street, E.C., under the styles of Souami and Company and the Hackney Motor and Cycle Company.

CONTINENTAL NOTES.

By "AUTOMAN."

THE scheme for chartering a steamer in connection with the Gordon Bennett contest has now been definitely realised, and a Transatlantic steamer of 3,000 tons has been hired by Messrs. Panhard and Levassor, Mors, and Michelin. The steamer will have on board as many as twenty-two automobiles, including, of course, the three cars which will dispute the cup in the French interest. There will, however, also be cars belonging to tourists who wish to visit Ireland in connection with the event. The steamer will anchor in Dublin Bay, and accommodate not only those who belong to the three firms above mentioned, but also a certain number of other passengers, who wish to witness the Gordon Bennett Cup race. The boat will serve also for an hotel for some of the French visitors. All this was settled at a meeting held at the A.C.F. some few days ago. It

race. The deputation above mentioned were met by the two Senators for the Ardennes, Messieurs Gontant and Gerard, and M. Abdeinour, Secretary of the Automobile Club Ardennais, and went over the road, which they found suitable for the purposes of the competition.

THE second International Congress of Automobilm will be held from June 15th to 20th at the A.C.F., Place de la Concorde, Paris. The Congress will comprise—general meetings, sectional meetings, conferences, visits to industrial establishments, trials, excursions, &c. No work can be presented to the meetings, or serve as a basis for discussion, if previous to May 1st the author has not communicated a *resume* or his conclusions to the Organising Committee. The following is a brief résumé of the programme:—Monday, 15th June, 10 a.m.—Opening Meeting.—Formation of the Sections. I. Technical Questions, 2 p.m. 1st Section: Motors:

Hieronymus on the 60-h.p. Mercedes on which he won the Rothschild Cup for Petrol Cars at Nice.

[Allgemeine Automobil Zeitung.]

is really a remarkable sign of the progress of this wonderful industry and the interest taken therein by sportsmen and others, to see such an important step taken as chartering a large steamer from Havre to Dublin.

SOME few days ago I happened to be dining at the railway station at Reims, when I met Messrs. Max Richard, Famechon and Tampier on their way to Buzancy, in the Ardennes. This competition must not be confounded with the "Circuit des Ardennes," which is a Belgian race in the Belgian Ardennes, and a repetition of last year's event. The French competition, for clearness' sake, has been named the "Circuit des Argonnes," and it is a long race over a triangular course, and without any neutralisations, to be held on July 19th next, under the patronage of the Chamber Syndicale de L'Automobile. The course is about 150 kilometres round, and consists of good roads in a most picturesque site, and in very hilly country, so that both speed and reliability will be needed in order to be well placed in the

Steam Motors—Generators—Motors General—Explosion Motors—Carburettors—Ignition—Apparatus and Wires—Various Motors. Tuesday, June 16th, 10 a.m.—Second Section: Electrical Vehicles: Electric Motors—Charging Stations—Petrol-Electrical Cars, &c., 2 p.m.—3rd Section: Transmission—Chassis and their parts—Carriage Work, &c. Wednesday, June 17th, 10 a.m., 4th Section: Power in Traction—Equipment of Cars—Equipment of Passengers. 5th Section: Economic and International Questions. 2 p.m.: Exploitation—Cost Price—International Questions. Thursday, June 18th, 10 a.m.—General Meeting of the Congress. 2 p.m.: Visits to the Chief Automobile Works. 7.30 p.m.: Closing of the Congress—Banquet at the Automobile Club de France. The festivities organised by the Automobile Club de France in honour of the Presidents and Delegates of the French and Foreign Automobile Clubs are:—Friday, June 19th, 9 a.m.—Excursion by Automobile to, and Luncheon at the Forêt des Fontainebleau. Saturday, June 20th.—Reception at the Automobile Club de France.

THE "Circuit des Ardennes," which takes place on June 20th and 21st, is already attracting attention, and amongst other cars entered I see four De Dietrich, two Gobron Brillie, and six Mors cars in the first category of heavy cars, and five Darracqs in the lighter category.

THE total number of competitors for Paris-Madrid so far is 280, which easily beats the 205 of the Paris-Vienna contest of last year. The number includes 107 big cars, 62 light cars, 48 voiturettes, and 63 motor-bicycles, the entrance-fees representing a sum of no less than £2,926. The start of the run on the first stage to Bordeaux will take place at 3 a.m. on May 24th. The question of the arrangements for the departure of the racers is a hard problem, which still remains to be solved. If, as on previous occasions, they are sent off at intervals of two minutes, car No. 280, supposing no forfeits are declared, will not be off till nine hours and eighteen minutes after the departure of car No. 1—that is to say, probably after the latter has reached Bordeaux. If, on the other hand, the cars are sent off at intervals of only one minute, the road from Paris to Bordeaux, with at least 200 racing cars tearing along it at distances of probably less than a mile one behind the other, is likely to be one long stretch of unbroken dust-cloud.

M. TAMPIER, the official timekeeper of the A.C.F., was officially appointed to examine the roads and report on them, with a view to enabling the racing committee of the Spanish and French Clubs to choose definitely the route for the Paris-Madrid motor-car race. M. Tampier, therefore, is the best authority on the question of the roads, as he has been over every inch of them carefully. He tells me that as far as Bordeaux the route is in an excellent condition, incomparably good; but from Bordeaux to Vittoria will be a very hard stage. On the French side of the frontier there are 52 kilometres of setts, and not in a very good condition; and on the Spanish side of the frontier the roads are very indifferent and narrow. They can be compared more or less to the Swiss roads, which were neutralised in the last Paris-Vienna competition.

A LONG list of prizes in connection with the Paris-Madrid race has been transmitted to the A.C.F. by the Spanish Club, and they include:—

1. A prize from the King of Spain for the first car of any class whatever winning the race.
2. A prize from the Prince and Princess des Asturias for the first car which crosses the Spanish frontier, irrespective of any classification.
3. A prize from the Infanta Isabel, for the second car which reaches Madrid after classification.
4. From the Minister of Agriculture, for the first car using alcohol as a fuel and arriving at Madrid, after classification.
5. A prize from the Municipality of Madrid, for the first car that shall arrive in Madrid without any reference to classification.
6. A prize from the A.C.R.E., for the first car of the first category, which shall arrive in Madrid, after classification.
7. A prize from the Ladies' Society of Madrid, for the first car of the second category arriving in Madrid, after classification.
8. A prize from the Grand Pegna Club, for the first car of the third category arriving in Madrid, after classification.
9. A prize from the Casino of Madrid, for the winning set of cars after classification.
10. A prize from the Nuevo Club, for the first car of the fourth category after classification.

In addition to this, the towns of Burgos and San Sebastian are giving prizes for the first car which will arrive within their precincts. And this is only the Spanish side of the prize-list. The French side will be even greater still, so that cars that are well placed in the race will have nothing to complain of. In the course of the Paris-Madrid race there will be, according to the calculations of the "Auto," upwards of 5,000 cyclists engaged in piloting and guiding the competitors, and in assisting generally in the organisation and carrying out of the race. From Paris to Bordeaux there will be upwards of 38 kilometres of neutralised ground, and 3½ hours of neutralised time. The cars will have to pass over fifteen level crossings.

PARTICULARS of the new French racers entered for Paris-Madrid are now leaking out. Mors is putting the finishing touches to eight 80-h.p. cars. The engines have four cylinders, while a new feature is found in the front springs. The vehicles will be driven respectively by Baron de Forest and Messrs. Vanderbilt, Salleron, Fournier, Leger, Terry, Rigal, and Gabriel. Of the C. G. V. cars, M. Charron will drive the 40-h.p. eight-cylinder vehicle, with two speeds; M. Girardot and M. Voigt will each run 60-h.p. four-cylinder racers; 20-h.p. cars will be driven by Messrs. Giraud and Comiot, and a 15-h.p. by M. E. Lose. Gobron-Brillie will have three 110-h.p. cars and two 40-h.p. vehicles in the race, while Serpollet has prepared half a dozen 40-h.p. cars and three 20-h.p.'s, and these are already having a preliminary canter over the route.

No less than fifteen Mercedes cars are entered for the Paris-Madrid race—six 90-h.p., eight 60-h.p., and one 40-h.p. It is reported that it is the intention to select the three cars which prove the best in this big race to represent Germany in the Cup contest. Since the above was written the "Neues Wiener Tagblatt" has published a statement that the Mercedes firm will probably declare forfeit in the Gordon Bennett race owing to differences having arisen between the firm and the German Automobile Club with regard to the drivers of the cars.

IN connection with the Paris-Madrid race, as I have already mentioned, there will be held a touring excursion. It will start from Paris on May 13th, between 7 o'clock and mid-day, in the order in which the cars turn up. On the first day the excursion will go as far as Pougues, about 126 miles, via Fontainebleau. On May 14th the destination will be Royat, about 100 miles, via Clermont-Ferrand, the locality where Michelin has his works. On the 15th, 16th, and 17th about 287 miles will be accomplished from Royat to Agen, with the faculty of stopping anywhere desired, as long as Agen is reached on the night of the 17th. On Monday and Tuesday, May 18th and 19th, 196 miles will be covered, from Agen to St. Sebastian, and Wednesday, the 20th, will be passed as a day of rest in St. Sebastian. On Thursday the Spanish frontier will be crossed, at Zarus, where a halt for lunch will be made, and Bilbao reached at night, 87 miles from St. Sebastian. On May 22nd the journey will be from Bilbao to Vittoria, 43 miles, but in the morning an excursion will be made from Bilbao to Portugalette. On May 23rd Burgos will be the destination, and the distance will be 68 miles. On the 24th the party will reach Valladolid, having covered 80 miles. The destination on Monday night, May 25th, will be Salamanca, 80 miles further on, and on Tuesday evening, May 26th, Madrid will be reached, via Escorial, after a day's journey of 125 miles. After the finish of the Paris-Madrid race there will be an excursion organised in Andalusia, but the itinerary has not yet been fixed.

THOMAS SHAW, Dundee (Limited), of Dundee, has been registered with a capital of £3,000, to acquire and carry on an existing business of cycle and motor agents.

AT the North Tawton (Devon) fair, the Hon. John Wallop said he was no friend of motor-cars, but he believed they would be serviceable to the agricultural community.

AN amalgamation has been effected of the Bavarian Automobile Club, of Munich, the Frankische Automobile Club, of Nuremberg, and the Wurtburg Automobile Club.

MANY good jokes could be told by motorists of their first few weeks' experience, but as the laugh is always on themselves their fellow men hear little of what has taken place.

FROM the Searchmont Automobile Company of Philadelphia comes a well-printed catalogue of the 1903 model Searchmont car. The list gives detail drawings of various of the parts, and a large plan showing the general arrangement. The vehicle is fitted with a 10-h.p. two-cylinder engine, and closely follows the lines of European-built cars.

ELECTIONS AND MOTOR-CARS.

FROM Yorkshire comes a complaint from a keen motorist who is troubled because his *confreres* have not shown an enthusiastic support of the candidature of a fellow motorist for the local urban and district council. Recently he wrote to twenty-four members of the A.C.G.B.I., six of whom promised to assist a certain

candidate and only one of whom actually did so. If another car had put in an appearance the defeat would have been changed to victory. Seeing that the motorist thus seeking election to the Shipley Urban Council would have looked after the roads of the district, his return would have been a pleasing event to many friends.

The subject of automobiles at elections is one that has loomed

leave imprints of their presence on the smart upholstery. At present the charm of automobiles at elections is still new; the chance of sport still present and the prospects are rosy for the candidate who can command the most cars. But the pleasure of lending one's vehicle at election times is not wholly unalloyed.

Despite the dawning of these facts upon the motorist, the subject has been discussed at a meeting of the committee of the Automobile Club, and something like a decision has been come to. In fact, from the minutes it would appear that, in future, the Club will invite members to send motor-cars to aid the election of candidates who have pledged themselves to support reasonable automobile legislation approved by the official body of the movement. Not satisfied with this declaration, it has also been agreed that members should be asked to withhold cars from candidates unwilling to support the general policy of the Club. Both decisions are to be regarded as quite distinct from the ordinary political demarcations, and would appear to open up visions of a new Parliamentary party. The ownership of a motor-car may yet become an essential factor in the political equipment of Mr. Joseph Chamberlain and Sir Henry Campbell-Bannerman. Certain it is that unless they adopt an attitude

Earl Shrewsbury and his Clement Car.

large in the public mind of late. Commencing with the Parliamentary contest in the Newmarket Division of Cambridge, every succeeding contest has seen the number of motor-cars grow and their importance increase until the old cry for carriages and horses has been modernised into the demand for automobiles. It is significant of the overwhelming merits of the motor-car that in such a division as Newmarket a well-known motorist should win a seat, the cars lent by his friends contributing to success at the polls. Even in so urban a district as Woolwich the motor-car demonstrated its utility, and in the Rye division the fight was to the candidate whose motor-car did not break down. The occasional mishaps to the vehicle of the unsuccessful contestant presaged a defeat, and in the days of omens would possibly have caused him to relinquish the trial.

Every owner of a motor-car is now worried whenever elections take place by friends—or by the acquaintances of people who fancy they know him—who think that the only real way of showing sympathy with electioneers is by lending private automobiles. The voter enjoys the chance of a free ride in a car costing perhaps four figures; while the wife of the owner sees little interest in the business, especially if she is thwarted of a trip to some Society friends in order that a few labourers straight from the fields may

friendly to automobilism—of course we do not suggest they are laggard in this respect—they will not have the loan of automobiles from loyal clubmen. Whether they can face such an electoral contingency with equanimity depends upon the sportive tastes of their respective opponents.

All this tends to demonstrate the growing influence of the motor-car, and also the necessity of discretion being exercised by motorists in dealing with their legislative position. Any suggestion of intimidation would be resented by the average elector, and we are inclined to believe that this is a matter the Club will be powerless to rule. For, after all, political convictions are often stronger than pastimes, and there will doubtless be many instances of cross voting—or cross motoring. At present the motor-car is not so cheap that relays of vehicles are familiar on our estates; and the wife of the house will probably require some care being taken of her motor brougham. We have a suspicion that this car for the lightness of its construction, and the fact that it is the electoral vehicle of the future will not be the heavier vehicle of the past. After a more permanent

MOTOR-CYCLING NEWS.

A FRENCH electrician, M. Alphonse Bouchet, of Saint-Cheron, is reported to have recently built a motor-bicycle propelled by means of an engine using acetylene gas as fuel.

THE accompanying illustration shows the new chain belt lately introduced by the Coventry Chain Company, Ltd., for use on motor-cycles. It is intended to run on an ordinary V pulley, the blocks, which are made of fibre or leather, being

riveted up into a cycle chain. The company claim that with this device they have succeeded in combining the gripping qualities of the fibre with the non-stretching qualities of the chain, and that under practical test they have found it, even while running slack, to give a perfect drive up the steepest hills in the Coventry district.

ON the 26th ult. the Motor Cycling Club paid their promised visit to The Barn, Market Harborough. Mr. and Mrs. Edward Kennard and their son, Captain Kennard (15th Hussars), met the motorists midway between Harborough and Northampton, and showed the road to their residence. The guests numbered about sixteen, whilst others joined them from Leicester, Peterborough, and elsewhere. Most of the riders were splendidly mounted on high powered machines which scoffed at distance. Werners were much in evidence. Mr. Van Hooydonk bestrode one of his bicycles, fitted with a 2½-h.p. Minerva motor and a fore-carriage. The new Clyde 2½-h.p. made a brave show at the hills, and, under the skilful guidance of the vice-president, maintained its reputation. Previous to sitting down to luncheon the entire party were photographed by Mr. Kennard and his son. After a cold collation had been partaken of, the captain, Mr. Ernest Arnott, whom all were pleased to see about again after his recent severe fall, proposed the health of the host. In response, Mr. Kennard assured the company of the great pleasure the visit had occasioned Mrs. Kennard and himself, and expressed a hope that it

TO-DAY (Saturday) the Birmingham Motor Cycle Club will have a run to Dr. Johnson's old city of Lichfield. The "faithful city" of Worcester will be visited on the 9th inst.

MESSRS. LAKE AND ELLIOT have recently brought out the useful little tool illustrated herewith for removing the pulleys of bicycle motors from the shaft without risk of damaging the motors. The action is as follows:—The two points of the hangers are placed in the grove of the pulley, and made to grip

this by turning the set screw at the right. The handle is screwed down on to the projecting screw of the crank shaft (of course after removing the nut), the pulley being then drawn off quite easily. The device is adapted to take any section of wheel, with a flange, and practically all existing sizes.

THE Liverpool Motor Cycle Club held their run to Little Peover, in Cheshire, on Sunday last. Some time was lost at the start owing to the wrong road being taken. The ancient church at Peover was inspected before returning home. An incident on the return journey was the discovery of what was thought to be a police trap. Fortunately, this was not so, and Liverpool appears to be still free from such underhand schemes.

THE newly-formed Glasgow Motor-Cycling Club will hold a preliminary run to-day (Saturday), to Fenwick. The official opening run will be held on Glasgow "Victoria Day," May 21st, to Arrochar, going *via* Dumbarton and Loch Lomond, and returning *via* Loch Long, over the Whistlefield Hill, and along the shore of Gareloch.

The Motor Cycling Club at the Barn, Market Harborough.

might become an annual affair. At 3 p.m. the return journey to London was commenced. Unfortunately, the day proved dull and sunshine was lacking for photographic effects. Nothing will give the Club a greater stimulus than successful runs at whose termination the members are assured of so hearty a welcome as that afforded by Mr. Kennard.

THE Southampton County Motor Club had a capital run to Lymington on Saturday, via Hythe and Beaulieu. Tea was served at the Londesboro' Hotel, Lymington. The roads were in good condition. Just outside the town there is a toll gate where a charge of 1d. was made for motor-cycles and 2d. for machines with a trailer.

HERE AND THERE.

MR. A. S. HILL, of the Coventry Chain Company, has been elected President of the Cycle Engineers' Institute for the ensuing year.

It is reported that Mr. Stead is about to make an attempt to run from Paris to Nice in twenty-four hours on his 24-h.p. De Dietrich car.

A PUBLIC service of De Dion steam omnibuses has been started between Troyes and Tonnerre, France, a distance of thirty-eight miles.

MR. W. F. PEARE, of Waterford, has just received delivery of a beautifully finished 10-h.p. Gladiator car to the order of Sir H. Hudson-Kinahan.

A MEETING of the committee of the Motor-Cycle Trades' Association was held on the 23rd ult., to pass the memorandum and articles of association.

MESSRS. O'HALLORAN, BROS. AND CO. have been appointed European agents for the light cars of the Crest Automobile Manufacturing Company, of Cambridge, Mass., U.S.A.

HEREWITH we illustrate in elevation and plan the Napier 75-h.p. racing petrol launch, which is being built for the international motor-launch race to be held in connection with the Automobile Fortnight in Ireland next July. The hull is built of 20 B.W.G. steel, and the frames and floors of light angles

Elevation and Plan of Napier 75-h.p. Racing Petrol Launch.

and plates. The total length of the boat will not exceed 40 ft. over all, to conform with Mr. Alfred Harmsworth's conditions for the International Racing Launch Cup. The weight of the hull will be under half a ton, and the total displacement will be $1\frac{1}{2}$ tons. The beam is to be 5 ft., and the moulded depth 2 ft.: the engine will have four cylinders, developing 75-b.h.p. at a speed of 800 revolutions per minute. It is expected that a speed of 25 knots will be attained.

THE most ambitious tour of the season planned by American automobilists is that from Chicago to the Mammoth Cave, in Kentucky, which will be undertaken by members of the Chicago Automobile Club the last week of June and the first week of July. Fifteen members of the Club have already signified their intention of making the trip, each being accompanied by three friends as guests, thus already making a party of sixty. The tour will cover about 1,000 miles and extend over fourteen days.

MR. J. WILLIAMS, of Haslemere, has been touring Ireland on a motor-bicycle. While at Kilross, near Tipperary, a horse seems to have been frightened by the machine, with the result that a man was thrown from the cart he was driving and killed. At the inquest the jury found a verdict in accordance with the evidence, that death was caused by concussion of the brain, and added the following rider:—"We desire to add also that, owing to the many accidents that have occurred from time to time of a similar nature and through a like cause, some legislative means should be taken to ensure public safety from them in the future."

EARL RUSSELL has drafted a Bill to amend the Locomotives-on Highways Act, 1896.

FROM the B. F. Goodrich Company, of Akron, Ohio, we have received an elaborate catalogue. It is devoted to the Goodrich clincher tyres, and describes in minute detail the operation of attachment and detachment.

THE Gare Patent Tyre and Wheel Company, Limited, has been registered with a capital of £12,000 to adopt an agreement with Mr. T. Gare, and to carry on the business of manufacturers of tyres and wheels for all kinds of vehicles.

ON Sunday next, the 3rd inst., the Austrian Automobile Club will hold its annual hill-climbing competition from Neuwaldegg to Exelberg. Over twenty entries have been received, including two 28-h.p. Lohner-Porsche combination petrol-electric cars.

HAVING seen the letter in last week's *Journal* as to the provision of facilities for motor-car instruction in the Metropolis, Mr. George Tufnell writes to inform us that he has a private track in the Leytonstone Road, Leytonstone, E., for that purpose.

THE Rev. S. B. Stallard Penoyre, rector of Stockton, in Herefordshire, and Dr. Douglas W. Eshelby, a resident in the parish, are anxious to find the owner of a motor-car, painted red, which passed through their village on a recent evening, driven at the rate of more than thirty miles per hour.

THE Vienna "automobile week" has now been definitely fixed by the Austrian Automobile Club for September 6th to 13th. The Austrian International "Circuit" will be run on September 6th, the Pöetting Cup on September 7th, and the Semmering Hill Climb on September 13th.

A SERIES of lectures under the title of the Westminster Lectures has been commenced at the Caxton Hall, Westminster-Street. These will be held on Friday afternoons during May, and on the 8th inst. Mr. Mervyn O'Gorman will lecture on the economic use and probable future of the motor-car.

THE new two-seated voiturette which the Lanchester Engine Co. Limited, will produce in large quantities for next season will retain many of the features of the present car. Lightness, speed, and simplicity will be the chief qualities, the present standard of high-class finish being retained.

At the Crystal Palace on Saturday, the Aero Club opened its season with two balloon ascents. Each of the balloons was of 45,000 cubic feet capacity. In one of them, the "Graphic," Mr. C. F. Pollock ascended, accompanied by Professor A. K. Huntingdon, Mr. Martin Dale, and Dr. F. W. H. Hutchinson. In the other balloon were Mr. Frank H. Butler, Mr. A. Leslie Bucknall, and Mr. Percival Spencer. The "Graphic" ascended a quarter of an hour before the other balloon, and descended near Rochester. The second balloon descended at Sittingbourne, and when passing over the Chatham Dockyard narrowly escaped fouling a man-of-war. The trail rope touched one of the masts of the warship, but by skilful manipulation the balloon was got clear.

NORFOLK MOTORISTS AND THE POLICE.

THE furious driving cases in Norfolk arose in connection with the Easter run of the Norfolk Club, and P. C. Crane's description how he measured a quarter of a mile by pacing it was a feature of the trial. It was suggested by the solicitor for the defence that he took very short steps. Mr. A. C. Havers, architect, of Norwich, said that on the previous Friday he went with Mr. Garland and timed him, after having previously measured out a quarter of a mile with a tape. He did the distance in 80 secs. The constable's measurement was 12 yards short of a quarter of a mile. Major Cubitt (to Police-constable Crane): How many paces did you measure? —440. Major Cubitt: Then, as a soldier, I tell you you are short. Police-constable Crane: I went 70 yards beyond that. (Laughter.) In the case against Mr. J. J. D. Paul, Police-constable Aldous said he covered the distance in 5 min., or at the rate of 18½ miles an hour. The stop watch which the other constable, Pile, had was being stopped with a pin. They did not rely on that watch, however. Mr. Morris protested against being timed by such a watch. He was on the high road, and never left it to conceal himself. All the defendants could see him for at least a quarter of a mile before he came up. The road was absolutely straight. Mr. George Chamberlin, Chairman of the Automobile Club, by permission of the Chairman, then addressed the Bench. Every member of the Club, from their Royal patron down to their youngest member, would be guilty of a breach of one of their principal rules if at any time they drove in an ungentelemanly or unsportsmanlike way, or in any manner at all dangerous to his Majesty's lieges. What he ventured to suggest to the Bench was that this trap which was laid by the police on this high road on the first day that the Club went out for its initial run to Yarmouth was laid at a spot which, as they who knew the district well would say, was a place where motorists could have run even at over twelve miles an hour with danger to no one but themselves. He went from Acle to Yarmouth, and from Yarmouth to Acle, and the only traffic he met was two small herds of cattle, one carrier's cart, and a man on a bicycle. It would be diametrically opposed to the wishes, as well as to the interests, of the Club if any member drove through any inhabited place where there would be danger to vehicular or pedestrian traffic. On this road, no matter at what rate they went, they drove with danger to no one but themselves.

HILL-CLIMBING TRIALS.

At the hill-climbing trials at Dashwood Hill, organised by the Oxford Automobile Club, the following times were made:

In the class for cars whose list price did not exceed £300, Mr. F. G. Barton, on a 5-h.p. Clement, made the ascent in 2 min. 58 1-5 secs. For vehicles catalogued at over £300, the best time was by Mr. W. E. Batt (representing Mr. W. L. Creyke), on a 6-h.p. Serpollet, in 1 min. 20 3-5 secs. The nearest approach to this was by Mr. Underwood, on a 10-h.p. M.M.C. car. On a 2½-h.p. Humber motor-bicycle Mr. Rowell made the ascent in 1 min. 49 4-5 secs. The cup for the best time was therefore won by Mr. Creyke, but as he had presented it, he withdrew his claim in favour of Mr. Rowell, who was not, however, a member of the Club, and it thus went to Mr. W. Collier.

CORRESPONDENCE.

PUBLIC MOTOR SCHOOLS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The letter from "Would-be Motorist" in your last issue, asking for information as to privately-owned grounds where amateurs may learn to handle vehicles with confidence, opens up a question which will need solution before long. It is all very well for vendors of motor-cars to send the purchaser out in charge of a skilled man in order to teach him how to drive, and then to permit the buyer to take charge in some quiet country road, but something more is necessary. Of course, what is everyone's duty becomes no man's task, but surely some solution of the difficulty might be found. Would it not be possible for manufacturers and agents to run a joint school and track in the neighbourhood of London? For instance, could not the Herne Hill cycle track be used for the purpose in question?—Yours truly,

WOULD-BE STUDENT.

THE CLASSIFICATION OF MOTOR-CYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. Hooydonk's chief grievance seems to be that, to illustrate a fact, I named a certain machine—a particularly light one. I am afraid I may have to use the same machine as an illustration again in regard to another point which he raises, namely, that classification by weight will mean skimping the vital parts, and consequent weakness and danger. Another argument I might use is the results of "weight competitions" on cars, which have been reduced in weight enormously during the last few years, and have even added to their strength. Mr. Hooydonk's remarks re racing at Bexhill do not call for much comment, as the idea of racing with mudguards and other roadster fittings is ridiculous to anyone who rides with the intention of winning, if possible. Another statement, namely, that

the English manufacturers know all about building the bicycle part, is in my opinion rather exaggerated. Our manufacturers are undoubtedly at the top of the tree, as far as ordinary cycles are concerned, but the stresses on the motor-bicycle are quite different, and the makers have a lot to learn yet. There were many broken front forks last year on English machines, though the make I have particularly in mind was heavy enough, goodness knows. Weight does not necessarily mean strength. Mr. Hooydonk would like to foster "greatest horse-power for given cylinder capacity," irrespective of weight, but I still maintain that, particularly for motor-cycles, the object should be the "greatest power for given weight," and I am very pleased to find that the Automobile Club has adopted this latter standard.—Yours faithfully,

ERNEST H. ARNOTT.

POINTS ON LUBRICATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the article in the last issue of the *Journal* on "Lubrication," which is no doubt to the point, the writer recommends the introduction of petrol to the cylinders as a cleaning agent after an over-dose of lubricant. Personally, I am much against using petrol in the motor cylinders for this purpose. Petrol rots the fine surface of the cylinder walls, and searches out the lubricant thereon so severely that some considerable time must elapse before a good rubbing surface is imparted again. Whenever it is necessary to clean out use paraffin oil only.

The writer has reason to believe that if users and builders of motor-car engines would place before the lubricating oil manufacturers the fullest particulars of their respective type of cars and engines instead of, as is frequently asked for, "oil for water-cooled motor," or "air-cooled motor," much greater satisfaction would prevail all round.

Regarding excessive lubrication it should always be borne in mind that with the ordinary drop-feed oiler to cylinders, if these be set to give six drops per nipple when the car is standing and not moving over the road surface, nearly twelve drops will be fed at normal travelling speed. In this matter the motorist should always use his nose and eyes, noting the quality of the burnt gases from the exhaust silencer.

Good oil should perform these services: (1) Reduce friction to the minimum; (2) continue to lubricate and prevent seizing of pistons when the circulating pump does only 25 per cent. duty, or is inefficient; (3) withstand high temperatures, giving off no vapours, which vapours, however slight, will mix with the new charge in the suction stroke and lower the power of explosion; (4) after a period of intense heat should leave no gummy deposit in cylinders or valves.—Yours faithfully,

E. SHACKLETON.

THE SPECIFIC GRAVITY OF PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The paragraphs which have recently appeared in the Press respecting the specific gravity of "Pratt's Motor Spirit" have made it evident that many automobilists are apparently unaware that the specific gravity or density of a spirit is not, of itself, an invariable indication of its suitability for motor purposes. As a matter of fact, it is quite possible to have a spirit of a specific gravity or density of '680, as ascertained by the hydrometer or densimeter, which shall, nevertheless, be quite useless for motor purposes.

Provided that petroleum spirit is properly manufactured, it may safely have, in our opinion, a specific gravity as high as '715, or even '720, and give perfect satisfaction in motor-cars. It was not until after we had satisfied ourselves, by means of practical tests, as to the correctness of this view, that we decided to supply "Pratt's Motor Spirit" of a greater density than '680. At the outset, we supplied '700 specific gravity, and a month or more's trial of this demonstrated the fact that "Pratt's Motor Spirit" of that density gave perfect satisfaction, so much so, that no difference in the results obtained was apparently noticed. From '700 specific gravity, we proceeded gradually to '715 and '720. Whilst we have received a few complaints respecting this latter spirit, we have found that these have, in most cases, been made by those persons who having tested it with a hydrometer or densimeter, and found it to be of a greater density than '680, at once concluded that the spirit must necessarily be unsuitable. A far larger number of correspondents have, on the other hand, written to say that they have not been able to observe any difference in the results obtained.

In order, however, that there may be no uncertainty about the matter, we have requested Dr. Boverton Redwood to make a careful investigation of the subject, and we expect shortly to have his report.

In connection with this it is of importance for automobilists to know that, at the present rate of development of the motor-car industry, it may not improbably become, in the near future, a matter of great difficulty to supply the demand for spirit if '680 specific gravity be insisted upon. Automobilists will then be compelled to use a spirit of a higher density, such, for example, as we have been speaking of.

We can still continue to supply "Pratt's Motor Spirit" of .680 specific gravity, though only to a limited extent. In order that those automobilists who are to compete for the Gordon Bennett Cup may feel no uncertainty as to the quality of motor spirit which will be procurable in Ireland, we

beg to say that we are making extensive arrangements for having ample stocks of "Pratt's Motor Spirit" '680 specific gravity placed at convenient points there.—Yours faithfully,

ANGLO-AMERICAN OIL COMPANY, LIMITED.

THE NUMBERING QUESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It seems a pity the A.C.G.B.I. Committee could not have put a simple issue before us like this:—"Are you in favour of leaving the law as it is, or of an attempt to amend it on the lines of the Bill put forward by the Committee of the Club?"

But it is to be hoped that no one will vote for the "Scott-Montagu" Bill under the specious idea that the Club or anyone can bind Parliament to do anything, especially about any judgment of a court. Clause 15 in the amended Bill would surely act as a red rag in Parliament.

Surely the renewed outbreak of police and magisterial intolerance in certain places, and the intemperate prejudice shown by Parliamentary questions and in the *Times*, should warn us against giving any assistance to reactionary legislation, which would make us more than ever the (easier) victims of such prejudice.

Clause 3 of the amended Bill (even if Parliament were to pass such a complete and dangerous overturn of the usual principles and procedure of the criminal law, and appeals thereat), would bring us no remedy. Even if we got to the Supreme Court judge he could and would only listen to points of law.

I see the Bill is not intended to apply to Scotland (since the Local Government Board has no jurisdiction here, nor is there, of course, any

containing the ten gallons were marked "petrol, highly inflammable." He admitted that in about two instances he had sold petrol when motor-cars had been stranded. He could give, however, innumerable cases where he had refused to sell petrol, and in consequence he had been reported to the Automobile Club. Mr. Neville, addressing Mr. Kendrick, asked if it was desired for the petrol to be forfeited. Mr. Kendrick. No, sir. We have no provision to keep petrol ourselves. We might set up a corporation motor-car. Mr. Neville said if defendant stored highly inflammable spirit in such a place he should impose a heavy penalty. He would be fined £10 and costs.

MOTOR-CAR ACCIDENTS.

A KINSON (Dorset) jury has held an inquiry into the death of a child killed by being knocked down by a motor-bus proceeding through the village while on a journey from Bournemouth to Wimborne. After hearing the evidence, which went clearly to exonerate the driver, the jury returned a verdict of "Accidental death, and testified that there was no blame attributable to the driver of the car. They expressed the opinion that efforts should be made to check the high speed at which motor-cars (with special reference to private cars, and not with regard to this particular one) were driven along that road.

DR. DANFORD THOMAS held an inquest at Marylebone on Samuel Jole, who was killed in Marylebone Road, London. The Hon. Dudley Marjoribanks said he was the owner of an electric brougham. He was being driven in it down Marylebone Road towards King's Cross, at about 10 miles an hour. He saw Jole step off the kerb in front of the brougham. The car-

M. A. Peugeot at Home at Valentigney (Doubs.)

Court of King's Bench), but if Parliament took it up, I fear we should be dragged in by clauses supplied from the Scottish Office; and in any case it seems the duty of Scotsmen to point out, and prevent by vote, anything which they may feel is against principle and the public weal in the sister kingdom.—Yours truly,

NORMAN D. MACDONALD.

THE STORAGE OF PETROL.

At Wolverhampton Police Court, before Mr. N. C. A. Neville, G. E. Brown, ironmonger, Snow Hill, Wolverhampton, was summoned for keeping at Bell Street a quantity of petrol exceeding three gallons in bulk without a license, contrary to Section 7 of the Petroleum Act, 1871. Mr. Kendrick (assistant town clerk) prosecuted, and Mr. Haslam defended. Mr. Kendrick said the defendant had a large coachhouse in Bell Street, and dealt largely in petrol spirit, the principal store for which was at Sedgley. On April 3rd P.S. Bates visited defendant's premises, and found ten gallons of petrol spirit stored under conditions which were certainly very dangerous. P.S. Bates, sub-inspector under the Act, said the coachhouse was saturated with linseed oil. There was no notice on the door as to what the place contained. In reply to questions, witness said there was no ventilation, so far as he could see, but if the defendant said there was he would not dispute his statement. The place was not licensed, neither had notice been given that petrol was to be stored. The defendant gave evidence. He said he thought he required a license if he sold the spirit, but not if he stored it for use with his own car. The barrels were empty, and the cases

was on its proper side. Jole's back was towards the brougham. He must have been about 10 yards ahead. The driver instantly put on both brakes and rang his bell, but the front of the car caught Jole in the back and the car went over him, crushing him. The jury returned a verdict of accidental death.

An adjourned inquest has been held at the Northampton Borough Police Station, before the Borough Coroner, on the body of John Wright, aged 79, who died on April 4th as the result of injuries sustained through being run over by a motor-car at Kingsthorpe, on October 24th, 1902. The jury returned a verdict of "run over by a motor-car."

CLAIM FOR DAMAGES.

In the King's Bench Division, Mr. Justice Phillimore and a common jury have heard an action brought by H. C. Gooseman, Denbigh Street, W., against A. J. Airey, of High Street, Lewisham, to recover damages for personal injuries sustained in a collision between a motor-car, in which the plaintiff was riding, and a cart driven by a boy in the defendant's employ. The plaintiff's case was that on October 15th, 1902, he was being driven in a motor-car along the High Road, Lee, when the defendant's cart came along on the wrong side of the road, and at an excessive speed. In consequence of the boy in charge of it not keeping a proper look-out a collision took place, in which the plaintiff received such injuries that he was laid up for some weeks, and received a severe shock from which he was still suffering. The jury returned a verdict for the defendant, and judgment was given accordingly.

Where no alleged speed is given it is understood to be above the legal limit.
* Motor-Cycle Cases.

At the moment of going to press we received from several of our correspondents news of other cases too late for insertion.

WALTER WILLIAMS, a Coventry machinist, has been summoned for furiously driving a motor-car at Allesley. Defendant said that whilst he might have been exceeding the legal limit it was through putting a car weighing nearly two tons at a hill which it could not have got up had it not been given a good start. He was testing the car's capabilities. Major R. J. Beech (chairman) said the Bench desired it to be known that they did not approve of the locality in question being used as a trial ground for motor-cars.

SIR WILLIAM BARTTELOT, Bart., was summoned by the police at the Westminster Court for driving a motor-car to the common danger at Knightsbridge. Police-constable 327 B. said that about 4.40 on the afternoon of the 28th ult. he saw the defendant drive a motor-car on the wrong side of a pedestrian refuge at Knightsbridge. He collided with another car at the junction of Sloane-street and High-road, and when told he had driven the wrong side of the refuge, he replied, "I am on the right side." To the officer's statement that he would be reported for a summons, Sir William replied, "I don't mind." Mr. Sheil—I will adjourn the summons for another week. Let the defendant be informed that unless he answers this day week there will be a warrant.

CLAUDE BROWNE, of Onslow Gardens, S.W., and Rowland Browne, of Bramham Gardens, Kensington, were summoned at Marlborough Street Police Court for driving motor-cars in Hyde Park on March 19th at a greater speed than 12 miles an hour. Several constables and the gatekeeper of the park gave evidence of having seen the defendants racing with their motor-cars round the park at a speed of from about 20 to 30 miles an hour. Mr. E. Campbell Muir deposed to having been on his car on the occasion in question, and said that when he was about to turn his vehicle round he was placed in danger by the conduct of the defendants. He never saw such a disgraceful piece of driving, and if motor drivers continued that sort of thing all those who drove motors would probably suffer in consequence of possibly having permission to drive in the park taken away from them. He had driven a car for six years, and thought—though it was very difficult to give an estimate of the speed of a car—that the defendants must have been going at a rate of from 20 to 30 miles an hour. The defendants did not appear in court, but a solicitor who attended, in pleading guilty on their behalf, stated that Mr. Claude Browne, who was in the motor business, was now on his honeymoon. Mr. Kennedy imposed a fine in each case of £5 with 2s. costs.

SERGEANT BEACHER has distinguished himself, having secured a good haul of convictions at Horsham.

POLICE TRAPS.

SOUTHWARD of Wareham, the police have a measured distance running from the South Bridge towards Swanage.

MEASURED distances are being introduced by the police in the Windsor district.

BETWEEN Hellifield and Long Preston (Yorks) is a measured half mile.

OWING to an influential squire's horse being frightened by an automobile near Blake Street Station, on the main road from Birmingham to Lichfield, a petition has been signed by his neighbours asking the police to stop those motorists who exceed the legal limit. Motorists using this much-frequented road from the Midland Metropolis will do well to drive cautiously, or they may be trapped.

THERE is a police trap between Reservoir Hill and Lawnswood, on the Leeds-Otley road.

NO LIGHTS.

MR. C. H. BARLOW, of Liverpool, has been fined 5s. and costs for driving a motor-car without a light.

At the Nottingham Shire Hall, Richard Matthews, a groom, employed by Mr. Webb, Gedling Manor, was summoned for driving a motor-car at Carlton without a light. The defendant was fined 10s.

At the Frome Petty Sessions, Mr. T. Millard, of Frome and Trowbridge, has been fined £1 and costs for riding a motor-car at night without a light.

COMMENTS.

BUEA

MERE sectional reform of the roads with the maintenance of the present muddled state of control cannot be defended, in view of the wonderful changes now being effected in locomotion. The present roads were designed for pedestrians and horse traffic—both being comparatively slow in movement, compared with modern developments. The rail-less trolley car, the railway crossing, the tramcar rushing along a prepared track at twenty miles an hour, the huge motor-lorry with its accompanying trailer, the motor-bicycle with its fore-carriage, the motor fire-engine, and other new objects of interest in road traffic, all raise fresh questions that could not have been imagined in the older days of road construction. They must be considered now, and the question is, from this brief showing, one that must be regarded from a broad and liberal point of view. We propose to return to the matter in an early issue, being convinced that unless the necessity of a thorough discussion of the whole question is urged by motorists and road reformers, the present departmental committees on the subject may only serve to make confusion worse confounded.

Departmental Committee on Highways.

MR. W. REES JEFFREYS, hon. secretary of the Roads Improvement Association, has given evidence before the Local Government Board's Departmental Committee on Highways. He advocated the adoption of the recommendation of the Royal Commission on Local Taxation in favour of an additional grant from the National Exchequer in respect of the maintenance of main roads, and the allocation of portions of the grant to the improvement of existing main roads, as well as the construction of new trunk roads. He suggested that a Central Highway Department of State should be created to have control over highway administration throughout the country. Mr. Jeffreys also urged the advisability of reducing the number of highway authorities by transferring the highway powers of rural district councils to the county councils, and of simplifying the machinery by which land is acquired compulsorily for the widening and construction of roads; and concluded by pointing out the pressing necessity for the consolidation of highway law.

A Motor-Car Track.

MR. W. W. B. HULTON, chairman of the Main Roads Committee of the Lancashire County Council, has been emphasising before the same committee the benefits accruing from the fact that the county council have power to withhold grants towards the maintenance of main roads by the smaller highway authorities if the roads are not properly maintained, and by granting or withholding contributions towards the cost of works on ordinary highways to ensure that other highways are properly and efficiently maintained. Mr. Moncur, chief surveyor of main roads to the Staffordshire County Council, gave similar evidence in regard to the maintenance and improvement of the main roads in Staffordshire, and described his plan for a model motor car track, by which, on a road ninety-one feet wide, two carriage ways (for ordinary traffic), two footways, two motor tracks

(with bays for passing), and one bicycle track could be accommodated.

Manchester Club Run.

ON Saturday last the Manchester Automobile Club had a run to Leasowe, staying for the Saturday night at the Leasowe Castle Hydro, formerly the residence of General the Hon. Sir Edward Cust, Bart., and now an up-to-date hotel, which is situated in its own grounds of some 50 acres on the western shore of the Wirral Peninsula, and located between the Dee and the Mersey, on the very verge of the Irish Sea. The smoke-room of the hotel goes by the name of the Star Chamber, as it was some time ago fitted up with the old oak panelling which was originally fixed in the Court of Star Chamber at Westminster. The run to Leasowe was a very fine one, over roads that cannot be excelled, and through lovely scenery; unfortunately the weather was not propitious, which limited the number of members who took part in the run. The cars started back mostly in the forenoon, a stop being made at Chester for lunch. The following list gives the names of members participating in the trip, viz.:—Messrs. S. Brooks, C. Frost, A. E. Jones, H. M. Lowther, S. Okell, W. E. Roweliffe, J. Saville, J. Hoyle Smith, S. Wallwork, and J. Whittaker.

The Dust Problem.

THIS problem, as some people imagine, is not a new one, but dates from the earliest ages. At all periods, as students of history know, dust storms have overcome travellers, and at all times traffic of any and every description on the highways has been inconvenienced by its presence. Whether the traffic has been cattle or diligences, armies or cyclists, coaches or motors, the results have been the same blinding clouds of dust. In Tuesday's "Times," in its reprint of news of a hundred years ago, in an advertisement of a house for sale at King Street Hammersmith, as a special inducement to purchasers, it is mentioned that the house "is removed from the road by a courtyard, which prevents any inconvenience from the dust." At the "Old Ship," Brighton, we seldom sit down to a meal without gazing at the coaching pictures hanging on the wall, arousing feelings of envy of the good old times, when a coach would be driven along at twenty miles an hour, leaving in its trail the usual clouds of dust.

Motor Volunteer Corps.

OWING to the War Office delay, no one is yet enrolled in the Motor Volunteer Corps, and no officers gazetted, yet several of the members who have applied for enrolment have been doing some useful military work. On April 24th, three members, Messrs. E. Midgley, E. Clift, and W. C. Bersey, under Mr. W. J. Crampton, went down by road from London, and reported themselves at Dover to Major Webber, A.D.C. to Gen. Sir Leslie Rundle. On the following day they drove Field-Marshal Sir Evelyn Wood and Sir Leslie Rundle and staff on a tour of inspection in the neighbourhood of Hythe, Lydd, etc. All the arrangements worked perfectly, and the Field-Marshal expressed his approval of what had been done. Last week Messrs. E. Midgley and E. Owers drove Gen. Sir Leslie Rundle in a staff ride, organised by Field-Marshal Sir Evelyn Wood in the neighbourhood of Salisbury. On Thursday, the 7th inst., Mr. Vere Ker-Seymer took his 15-h.p. Panhard and drove Col.

Collings, commanding the Reading Regimental District, on a tour of inspection of his district. Mr. Vere Ker-Seymer was the guest of Col. Collings and his officers at dinner on the night previous to the inspection.

An Indian Run.

RECENTLY Lord Wolverton's motor-car, a 12-h.p. Gobron Brillie, made a notable journey from Poona to Mahableshwar, the first automobile trip on that Indian road. It carried Major Moss, Mr. A. Hoare, and the mechanic, and in the course of 76 miles three formidable ghauts were encountered. The road from Wai to Panchgani constitutes a rise of about seven miles. The actual running time was four hours fifty-two minutes.

A 12 h.p. Gobron-Brillie Car in India.

Ordinarily the journey by tonga occupies twelve hours, so that there was a substantial gain in time, although no attempt at racing was made. At Mahableshwar the car attracted considerable attention, the police having to keep the crowds of natives from it by means of a fence. The same car has also made a non-stop run from Poona to Bombay—124 miles—in less than six hours.

Progress Possible.

THE trip not only demonstrated the serviceability of the automobile, but also the restrictive nature of the regulations placed upon petrol. The result of these latter is that only inferior spirit is too often procurable, and after a few days' run with this Gobron car the valves had literally to be dug out with a knife, and ordinary carburettors were unable to deal with it. It is to be hoped that the Indian Government will recognise their duty, and foster intercourse between various parts of the great Dependency by means of the motor-car.

In North-East Lancashire.

THE annual meeting in connection with the North-East Lancashire Automobile Club took place at the Old Bull Hotel, Blackburn, when all the former officers of the Club were re-appointed, and Mr. A. Hitchon, of Clayton-le-Dale, and Mr. W. Livesey were added to the committee. In presenting his annual report the hon. sec., Mr. G. D. Walmsley, referred to the runs which had taken place during the past year and to arrangements which had been made for the supply of petrol to the members at a reduced price. The Club numbered thirty-one members, which would during the present season be increased to fifty. The Club has in hand a balance of £29 on the year's working, which, however, will shortly be considerably reduced by payment of the fee for affiliation with the A.C.G.B.I. The committee have decided not to ask the old members for any subscription during the current year. After the business meeting the annual dinner

was held under the chairmanship of Mr. F. T. Marwood, J.P., of Pleasington. The first annual trip of the same Club was held on the 23rd ult. Prior to the trip the participating members assembled in front of the Town Hall, Blackburn, and then proceeded to Hurst Green. Many of the members and their friends availed themselves of an opportunity which was afforded to them of inspecting the interior of Stonyhurst College. Afterwards an excellent tea was provided at the Sherbourne Arms, Hurst Green, and the party then proceeded homewards. Eight cars, a motor-tricycle, and three motor bicycles took part in the run, and there were upwards of thirty of the members and their friends present.

The Motor-Car Bill.

PROBABLY those who have, in season and out of season, advocated the registration, identification, numbering, lettering and labelling of motor-cars, are satisfied with the position in which motorists now find themselves. In the House of Commons on Tuesday, Mr. Ellis asked the President of the Local Government Board whether he would take steps to place the law with respect to motor-cars on a more satisfactory footing by removing the present hard and fast limit as to speed, subject to due security for the safety and convenience of other users of public roads, by requiring registration of the vehicles, and by enacting a high maximum penalty for breaches of these and any other conditions it might seem desirable to impose. Mr. Long, whose interest in automobilism was shown by his attendance at the Agricultural Hall Exhibition, replied to the effect that he had a Bill in preparation dealing with the subject, which he hoped shortly to introduce, and, in reply to a further question from Mr. Schwann, mentioned that he was considering the question of numbering.

Numbering and the Speed Limit.

MR. LONG'S Bill, it is understood in Parliamentary circles, will not provide for unlimited speed, but in exchange for registration and clear identification it will seek to increase the speed limit to from twenty-five to thirty-five miles an hour in the country. The exact mileage is not yet fixed. The Bill will also provide for very heavy penalties for violation. It has all along been urged that in agreeing to the numbering the withdrawal of the speed limit should be conceded. In fact, we have been told that the two points would go together. That the matters have thus been separated would seem to confirm the attitude of those who have consistently opposed numbering from the first.

100 Miles Non-Stop Trial.

THREE vehicles were entered in the quarterly 100-mile non-stop run of the A.C.B.G.I. on the 24th ult., viz., a 22-h.p. four-cylinder Rochet-Schneider car driven by Captain Deasy, which made the journey at an average cost for petrol of 0.92d. per mile. A 12-h.p. Boyer car, entered by the Automobile Supply Co., ran at an average cost per mile of 0.8d. The third car was a 10-h.p. Chenard and Walcker, entered by the Weston Motor Syndicate, and which ran its journey at an average cost of 0.25d. On the mile test, including Dashwood Hill, these cars made speeds equivalent to 20.8, 10.08, and 7.7 m.p.h. respectively. Elsewhere we publish a letter which the Weston Motor Syndicate has addressed to the A.C.G.B.I. on the subject.

Ladies' Automobile Club.

THE Ladies' Automobile Club of Great Britain has been formed with 110, Piccadilly as a centre. The Duchess of Marlborough is to be asked to become president, with Lady Scott Montagu, Lady Beatrice Rawson, and Mrs. Adair as vice-presidents. Lady Cantelupe is the hon. treasurer, and from the list of those who have already decided to associate themselves with this new body its social success is assured.

Extraordinary Traffic.

A CASE of importance to users of the roads has been heard by Judge Gwilym Williams at the Pontypridd County Court. The plaintiffs were the Glamorgan County Council and the defendant Mr. T. Morgan, the owner of brewery stores at Pontyclun and an hotel at Bridgend. Mr. Vaughan Williams appeared for plaintiffs, and explained that the county council sought to recover £135 from the defendant for damage alleged to be due to extraordinary traffic caused by a motor dray belonging to the defendant. The road over which the traffic referred to went was a section about ten miles in length between Pontyclun and Bridgend. In addition to having brewery stores at Pontyclun and an hotel at Bridgend, the defendant had a general business in the way of distributing mineral waters. In August, 1901, he acquired a motor-dray, which had been travelling along the road section in question at least once and sometimes twice in the day. When loaded the vehicle weighed eight tons. An important point was that the wheels of the dray were, relatively speaking, extremely narrow when compared with the weight. The weight on the

vice-presidents, Mr. King, taking the vice-chair. The day was a perfect one for motoring, and the roads were in good condition, although there was plenty of dust. After tea the route taken for home was through interesting country *via* Loughborough.

In the Lords.

IN the House of Lords, Lord Lamington has asked his Majesty's Government for a return of the cases reported to the police since January 1, 1902, in which injury was caused to the person or property of the public by motor-cars, otherwise than those accidents in which the occupants of the cars were alone injured. He said that in the meanwhile motor-cars were not really practical machines, and were not engaged in the commercial purposes of the country. They formed a branch of sport which was indulged in on the public roads with a very considerable risk to the public, and to the great detriment of public convenience and comfort. The most stringent regulations had been placed on railways in the interests of the public, yet here were persons who incurred no expense beyond that of the ordinary ratepayer, and used the roads to the detriment of the public

Motoring in India—On the Road to Mahableshwar. (See page 186.)

front wheels per inch of the width worked out at 5.1 cwt., and on the hind wheels at 10.85 cwt. The county bye-laws provided that the width of the wheels of vehicles should be of the regulation size in proportion to the weight. After hearing the case the judge reserved his judgment.

The Leicestershire Club.

THE Leicestershire Automobile Club held their annual meeting a few days ago, electing the officers for the coming year, and adopting a new set of rules. They are fortunate in having secured as president the borough engineer, Mr. E. G. Mawbey. It will be remembered that during Mr. Mawbey's presidential year of the Municipal Engineers he was instrumental in arranging a tour for his colleagues to various works in Leicestershire on motor-cars, gentlemen from all parts of the country lending their cars for the occasion. The hon. secretary of the Club is Mr. W. S. Hubbard. In the first run of the season, briefly mentioned last week, thirty-two members and guests participated, tea being taken at the Royal Hotel, Ashby-de-la-Zouch, under the presidency of Mr. Mawbey; one of the

good. He understood that the Local Government Board were framing some regulations. He would suggest that all motor-cars should be numbered—and also painted, according to their rates of speed. All drivers should have certificates, and, like engine-drivers, be required to pass a stringent examination. The Earl of Portsmouth agreed that some regulations ought to be put in force, but it was perfectly ridiculous that persons should be taken up and, without doing any injury to any human being, be fined for exceeding a certain rate of speed. What they wanted to do was to pass regulations making people drive carefully, and provide for the severe punishment of those who were constant offenders. In reply Lord Belper said he could not enter into many of the questions raised. Speaking for himself, he regarded the present regulations as insufficient to meet the circumstances of motor-driving. There was no obligation at present to report accidents of the kind referred to in the question. No doubt there were a good number that came to the knowledge of the police, but to make a return the Home Office would have to apply to every police authority in the Kingdom, and that would cause expense and trouble. The Home Office felt that there would be no corresponding advantage gained in the attempt to get such

returns, which would be ineffective, and would not represent the true number of accidents that took place. He was informed that in the metropolitan police district forty persons were injured by light locomotives in the year 1902, as reported to the police. There were no persons killed.

Speed in Parks.

THE Liverpool Parks and Gardens Committee have received complaints as to the excessive speed of motor-cycles and motor-cars in Sefton Park, and the question as to their exclusion from the parks is to be considered at the next meeting of the Committee. We hope local motorists will be vigilant as to the course taken by the Committee in the matter. It is not for this body to prohibit automobiles, but rather to frame reasonable regulations as to speed, etc., and to take necessary steps for the due maintenance of such rules. On the other hand, motorists would do well to moderate their enthusiasm for speed in parks and other enclosed areas.

Motorists and Police Stations.

The Berkshire county authorities have under consideration the subject of improved police accommodation at Wokingham. This will, of course, entail considerable expense, and it will doubtless be considered satisfactory by many of the ratepayers to know that the police are trapping motorists and thus securing substantial additions to the funds. A quintette of summonses was heard the other day and £20 added to the county income, so that the rapid travellers in the district may be said to have contributed their quota of bricks towards the new building. In Huntingdon the Chief Constable frequently recounts the total of the fines inflicted on motorists; probably he will soon find an imitator in Berkshire.

The Glasgow to London Trial.

THIS event, organised by the Scottish Automobile Club (Western section), takes place on Wednesday and Thursday of next week, and twenty-five cars and nine motor-bicycles have been entered, the latter comprising two Triumphs, one Quadrant, two Wellers, one Ariel, one Brown, and two Humbers. The start will take place from St. Vincent Street, Glasgow, on Wednesday at 3.30 a.m., and on arrival at Leeds the cars will be driven to the garage of Mr. Rowland Winn in Great George Street, from whence they will be despatched at 6 a.m. on the 14th. Times will be taken at the A.C.G.B.I. on the Thursday evening. The maximum time for the second day is 16 hours 30 minutes.

Mis-use of Cars.

MOTORISTS should tolerate no liberties from mechanics and others they employ in connection with automobiles. A good proportion of the accidents that have occurred in this country have taken place when mechanics were taking the cars out without permission from their employers, and the action of Nicholl v. Beresford, reported on another page, is a case in point. This driver went on a car to call on a friend without any previous intimation to the Hon. Robert Beresford of his intention to use the car for personal pleasure. Whilst thus engaged, he ran down a motor-cyclist, who naturally had recourse to the law. Recognising in the driver one who was hardly likely to yield adequate damages, he sued the employer, who will have to pay as the result of the negligence as well as the impertinence of his servant.

"Keep an eye on One's Car."

THE point is an important one to our readers, and motorists should have their drivers most emphatically to understand that their cars are not to be taken out without permission and are not to be used for the gratification of the humours of private friends. Such folks rarely recognise the responsibilities of the position, and are generally careless with regard to the care of the property of other people. Cars are not inexpensive

toys, they represent hundreds of pounds, and those in charge should only be men who have some regard for the ordinary decencies associated with employment.

The Clipstone Trials.

WITH reference to the recent trials at Clipstone we have received a letter from Mr. E. Lisle as follows: "The Eliminating trials were instituted for the purpose of selecting the most suitable car for the Gordon Bennett race, which will be a road race of 360 miles, and in accordance with the rules laid down by the A.C.G.B.I. we built a car for that purpose, being under the reasonable impression that such a car would be the only acceptable one to compete in the Eliminating Race. The 'Star' car taken to Welbeck was geared exactly for the one mile race as it would have been for the full race of 360 miles. It had twenty-eight teeth sprockets fitted, whereas, if we had known it were possible to have fitted cars for sprinting, after the car had been passed by the Club officers on the 10th of April last, we should certainly have fitted twenty-four teeth sprockets, which would have given us a far better chance in getting up speed in so short a start, and we should doubtless have shown a very different and much better performance. We would draw attention to a point upon which various comments have been made in the press, viz., that the most reliable cars are required for the Gordon Bennett contest, and we would ask the spectators—Which was the most reliable and consistent running car at Welbeck? Whereas our car never once had its bonnet lifted or the engine adjusted in any way from start to finish, those of our competitors had repairs and alterations at the end of practically every run up and down the track."

A Challenge.

"To prove conclusively whether the best car will have been selected or not, we have made the following challenge to our competitors, Messrs. S. F. Edge, Ltd., to race over a distance of 50 miles or more, on the Continent, the best of the Napier cars which ran at Welbeck. The loser of the race to pay £100 to the Gordon Bennett Road fund. Should the Napier win the above contest it will not only satisfy us that the third car in the contest should be a Napier, but it would also strengthen the hands of the Club Committee in their selection, and also confirm the fact to the public which is the best and most suitable English-made car."

MR. G. MARCONI is among the new candidates for election to the Automobile Club.

THE postal vote of members of the A.C.G.B.I. with regard to legislation is about to be taken.

ON Sunday next the Rhenish Automobile Club will hold a race from Mannheim to Baden-Baden.

WE learn that Sir David Salomons has just purchased a 24-h.p. Georges Richard car from Messrs. Mann and Overton's, Limited.

MR. BALFOUR's motor-car driver has been fined £3 for exceeding the speed limit at Hook. This makes the third conviction since September.

MR. A. WINTON is reported to have covered a mile in 1 min. 2 sec. from a standing start on Wednesday. The trial was made on a circular track with one of the Gordon Bennett cars.

THE West Sussex Motor Company, Limited, has been registered with a capital of £5,000 in £1 shares, to carry on the business of manufacturers and repairers of and dealers in motors, and, in particular, to establish a service of motor-cars between Bognor and Chichester. The first directors are Messrs. M. F. Mievile, H. Lovett, and T. S. Adcock, and a central station will be established in Chichester, with a depot at Bognor, where competent repairers will be provided. The motor-car service will be started with five vehicles, and the Goodwood race traffic is expected to bulk largely in the profits.

THE "SPYKER" PETROL CAR.

ONE of the new petrol cars which the recent Automobile Exhibition at the Agricultural Hall brought to light was the "Spyker," made by the Trompenburg Manufacturing Company, of Trompenburg, Holland, the whole output of which concern for the next three years has been secured by the Bradford Motor Car Company. The cars are made in two sizes, 12-h.p. double-cylinder and 20 to 24-h.p. four-cylinder. In the following description we shall deal with the larger vehicle, but as the general arrangement in both is the same, it can be taken as applying to the 12-h.p. car equally well. To begin with the frame, this is rectangular and made on the "bois arme" system. It is mounted on the axles by steel forged scrolls and shackles, on four half-elliptic springs. The 20-h.p. motor (Fig. 1) which is located under a square bonnet, comprises four vertical cylinders, each 100 mm. diameter by 130 mm. stroke, and works up to 27-b.h.p. The valves are all mechanically-actuated, the inlet valves being on one side of the engine and the exhaust on the other. The ordinary system of high-tension electric ignition

inspection of these accessories and reducing the length of electric wiring to a minimum. The water circulating pump is gear driven; it is placed in front of the crank case of the motor. The radiator, which fills the front panel of the bonnet, consists of twelve serpentine-shape copper-tubes fitted with heat-conducting ribs. A fan is placed behind the radiator to induce a

continuous draught through the cooling plates and tubes. The watercooling is claimed to be so perfect as to enable a twelve hours' continuous run to be made without any additional water being required. One carburettor, which is of the float-feed spray type, supplies the four cylinders; it is self-adjusting, maintaining a perfect mixture at all positions of the throttle. The automatic governor, which acts on a throttle valve on the outlet from the carburettor, is controlled by a foot accelerator, making it possible to run the motor at any desired number of revolutions from 200 to 1,500 per minute, so that the consumption of gas can be kept strictly proportional to the power required, and consequently securing smooth running of the engine. Before leaving the motor we may refer to the fact that the crank

shaft has five bearings, and that four large hand-hole covers

Fig. 1.—The Spyker Four-Cylinder Motor.

Fig. 2.—Chassis of Spyker Two-Cylinder Car.

is adopted, the sparking plugs being placed in the crown of the combustion chambers, removed as far as possible from contact with oil in case of over-lubrication. The induction coil and accumulators are located on the dashboard, facilitating the

are provided to the crank case to enable the big ends of the connecting rods to be inspected.

Passing now to the transmission, this is through a clutch gear box, cardan shaft, and bevel gear to a live axle. A cone

clutch is employed, the clutch-striking spindle being hexagonal in form, so that it can be detached and lifted from its place merely by undoing two nuts. Three speeds forward and a reverse motion are provided, the drive on the top speed being direct, without intermediate gear being in motion, thus obviating undue wear in gears and bearings. The gear box is of aluminium, and, except for its cover, is one casting, thus preventing the leakage of oil at the bottom; the bearing brasses are inserted from the ends, and secured to the walls of the gear box by set screws. When the latter are withdrawn, the brasses can be taken out, and the gearshafts lifted from the gear box through the inspection lid. There is no necessity to disturb the gear box in any way. In the walls of the gear box over the gearshaft bearings oil wells are formed, from which the lubricant feeds regularly on to the bearings. A noteworthy feature of the change-speed gear is the means provided to prevent the gear being changed without the clutch being first withdrawn. This is obtained by a simple form of locking arrangement, the depression of the clutch pedal simultaneously lifting a locking bar from the gear sector, and allowing the change-speed lever to be moved from one notch to another. The change-gear wheels are made of a special silico-manganese steel, hardened through, and, in conjunction with the locking arrangement above referred to,

M. Thery on his Deauville Racer, fitted with Continental Tyres.

should have a very long life. The rear live axle is made of nickel steel and is well stayed; while the bevel pinion on the end of the cardan shaft rotating the bevel wheel on the axle, is furnished with both front and rear bearings.

Both the hand and foot brakes are so arranged that, on their application, the clutch is taken out. A pedal controls a metal-to-metal band-brake on the forward end of the cardan shaft. As to the brakes on the rear live axle, the encircling blocks are forced together and into contact with the drums by right and left-handed screws, rotated by the longitudinal movement of a side lever. The car has a wheel base of 6 ft. 8 in., and runs on 870 by 90 mm. equal-sized artillery wheels; with tonneau body, it weighs about 18 cwt. From the foregoing it will be seen that the "Spyker" car is on thoroughly up-to-date lines, and, judging from the large number of motorists to whom vehicles have already been sold, it is likely to become a familiar type during the coming season.

THE Steam Generators, Limited, has been registered with a capital of £12,000, to adopt an agreement with Mr. A. Lafargue and others to construct, purchase, and work omnibuses and vehicles, whether worked by steam, oil, spirit, liquid, or compressed air, electricity, or other mechanical power. The registered office of the company is at 34, Clements Lane, E.C.

THE DRIVING OF MOTOR-CARS.

ONE is often astonished at the way in which the modern motor-car is driven through thick traffic in town, and it is not a little surprising to think that serious collisions and side-slips are not frequent. For, on the one hand, the difficulty of controlling a restive "nag," and on the other the skill and judgment, which is often mistaken for foolhardiness, displayed by the car-driver must be confusing to the lay mind. The pity is that prejudice in many forms still continues to pit itself against progress in the automobile movement. Yet, as a spring of water feeds the mighty river, so surely is the motor-vehicle gradually gaining ground. But, "haste we to our tale."

There is a class of car-drivers, and that class is, we fear, in the majority, whose sole aim appears to be to dash through the most central and congested districts in town, and then often crawl along the country highways—where speed would be far more permissible—like unto a South-Eastern and Chatham Railway engine whose driver is picking flowers along the line as he slowly proceeds. Why this unseemly haste when so unnecessary and objectionable—why wilful wear and tear of expensive mechanism? Truly, one should not be surprised when accounts are sometimes published of excessive cost in the upkeep of a motor-car.

We see a car flash by us at a speed "well over the legal limit," as the phrase now goes, upon a hard wood road which is full of deep ruts and miniature excavations. The practical man sees it, and wonders why. Does the locomotive-driver dash full speed out of the terminus across intricate points and cross-overs? No, he waits until he has a clear road, and then he "gives her head."

Of course, we know that many cars do stand the strain owing to the excellent materials of which they are constructed, but it does not require the eye of the "expert" (horrid appellation!) to discern splayed-out axles and wheels which deviate from the path of truth.

To return to the engine-driver—he does not often wilfully put on full steam one minute, the next "race" his engine, and then, as suddenly, operate the brakes dead hard. He does not do this, simply because his employers would not tolerate it, but also because he takes a pride in the machine he controls. Yet the mechanic with his master's costly "sixteen" or "twenty-four" is permitted to do all these things with impunity, which points a moral, perhaps—that the owner himself is not aware of the damage that may occur. It may be urged that the horse-drawn vehicle is more like the motor-car, because it is driven on the highway. Not so; the latter should be looked at, undoubtedly, in the light of a road locomotive, and not a carriage with the horse removed. So, going further into the question, or possibly, more correctly, removing the "bonnet," the car owner does not desire to be presented with a long bill, for example, for a new crankshaft, which is owing either to his own or his driver's carelessness or ignorance. We fear that many must suffer from the last-mentioned affliction, which, however, is easily cured. There can be no doubt that half-an-hour's conversation with any engine-driver upon the subject would teach such motorists the advisability of considering, and thereafter using, the working parts of the "car they love" with much more care than they formerly bestowed upon it. Then explanation would ensue as to why he does not run his engine like a combined racehorse and broken-winded mare every five minutes. It is not within the province of this article to give instructions in the management of motor-cars, but the careful perusal of the hints published in the *Journal* will solve many difficulties of the novice. Were the budding motorist to take his pattern from the steady engine-driver before-mentioned, more pleasure, diminished fines, and, above all, less wear and tear would be the happy result. Think well of the car that carries you over.

THE IRISH FORTNIGHT.

WE are this week able to reproduce portraits of the three motorists—Messrs. Alexander Winton, Percy Owen, and Louis P. Mooers—who will represent America in the forthcoming Cup race. Mr. Winton, needless to say, is the founder of the well

Mr. Alexander Winton.

known American firm of motor-car builders which bears his name. As a manufacturer he has been called the American Panhard, but, wide as his reputation as a manufacturer may be, it is as an automobilist that Mr. Winton may justly claim pre-eminence. Although he has proved himself one of the fastest drivers in the United States, as witness his performances last year on the "Bullet" and "Pup," yet it would be difficult to find a man more unlike the dare-devil type of *chauffeur* than the quiet, reserved Scotch-American. In appearance he suggests the cool, but clear-headed driver of an express locomotive who has grown hardened and grey in the service.

PASSING now to Mr. Percy Owen, who will also drive a Winton car in the Cup race, we have here another expert *chauffeur* well known in American motoring circles. He is 28 years of age, and manages the New York branch of the Winton Co. Among other feats he established a world's track record for cars weighing between 1,000 and 2,000 lb. for all distances up to 10 miles in 1901; and for part of the season of 1902 held the American records with the Winton "Pup" until they were beaten by Mr. H. Harkness, another of America's expert motorists.

Mr. Percy Owen.

THE third American competitor is Mr. Louis P. Mooers, who will drive a Peerless. He is 30 years of age, and built his first automobile at Watertown in 1898. Early in 1901 he became the engineer of the Peerless Motor-Car Co., which took a licence from the De Dion Co., and built a 5-h.p. voiturette. His next automobile was an 8-h.p. tonneau, followed in 1902 by a 16-h.p. two-cylinder car. Late last year Mr. Mooers built a 40-h.p. four-cylinder vehicle and has now completed a racer of 80-h.p. for the Cup contest.

THE Winton cars for the Gordon Bennett race are reported to be in general appearance exact reproductions of the famous "Pup." The road wheels are 32 inches in diameter with 4-inch tyres. The front axle is dropped, with the springs mounted on top, while the rear springs are hung below the axle. The frame is of wood with $\frac{1}{2}$ -inch sheet steel sheathing. The engine is a four-cylinder one hung horizontally across the front platform with the heads on the left side. As to the horse-power no information is at present available. The cars have two speeds and

reverse, with a shaft connecting through bevel gear on to the rear axle. On the high speed the drive is direct. The wheel base is 8ft. 4ins. and the weight complete is 1,800 lbs.

THE transatlantic steamer which has been chartered in connection with the Gordon Bennett Cup is, writes our Continental correspondent, the *Ferdinand de Lesseps*, belonging to the Compagnie Transatlantique. It is of 3,600 tons burden and upwards of 360 feet in length. There is room for 60 first-class passengers, out of which 20 places have already been engaged by the French competitors for the race. There is accommodation for 44 second-class, and 50 third-class passengers. The *Ferdinand de Lesseps* will leave Havre on the 27th of June, and will take about 30 hours to go across to Dublin, where it should arrive on the afternoon of the 28th of June. It will remain in Dublin Harbour until the 4th of July, and it will leave for Havre, where it is timed to arrive on the afternoon of the 5th. It will therefore be a ten days' trip. The fare has not been definitely fixed, but it will probably be about 500 frs. for the first-class passage, and 300 frs. for the second, including full board the whole of the ten days. It will cost about 300 frs. to take a car over and bring it back to France.

GETTING to the different points of vantage on the course will be difficult enough for spectators under the most favourable circumstances; but the crush and excitement on the return journey must be fraught with increased dangers if crowds of gigantic proportions become concentrated within any particular area by reason of its favourable position or easiness of access. Apart from the Great Southern and Western system, whose line will facilitate railway travellers (presumably to Athy, Carlow, Maryborough, Harristown, for Kilcullen, Naas, Newbridge, Kildare, Monasterevan, &c.), Mr. W. G. Edmonds adds the suggestion that the Midland Railway of Ireland run excursion trains to Edenderry, in conjunction with a good car service to points nearest from that village; and also that the Dublin and Blessington steam trams run excursions to Poulaphuca, with a similar car service therefrom. These companies could largely requisition the services of Dublin jarvies to assist where the local supply of vehicles might be inadequate.

APPARENTLY there are many firms along the line of the official route in connection with the tour following the race who do not quite ap-

Mr. Louis P. Mooers.

preciate what a great quantity of petrol will really be required, and we would write this note of warning. Arrangements for additional supplies should be put in hand without delay. From

Cork we learn that "the demand for petrol is not very great, but it appears to be increasing, and we always hold a sufficient stock to enable us to supply without delay any orders we receive. We expect there will be greater demand for it during this season owing to the Gordon Bennett race taking place in Ireland"—a delightfully naive way of expressing what others regard as a demand that is likely to amount to a rush. We hope shortly to publish a list of Cork firms stocking petrol, and shall be glad to hear from any such.

THE district around Tipperary will afford good motoring for the roads are generally satisfactory. Like many another Irish town the place is ancient, its history dating from the days

The Eliminating Trial at Clipston.—Mr. Mark Mayhew on the Track.
Photo by] [Campbell and Gray.

of King John. The main street is more than a mile long, and in Nelson Street is a motor garage, where Mr. C. W. Walshe assists motorists and supplies petrol and motor spirit, etc.

IN view of the dust that will most probably be very troublesome in connection with the contest, we would suggest that this might be overcome by having the course watered with sea water before the event. Talking recently on the subject with a leading physician (Dr. Boyton) in one of the eastern suburbs, he drew our attention to the remarkable absence of dust at Clacton-on-Sea—a fact attributed to the use of salt water. Subsequent inquiries have confirmed this view. Hastings was the first town to use sea-water for municipal purposes, but it was abandoned in consequence of the deleterious effect of the salt water upon the macadamised surface of the roads, the water mains, hydrants, etc. At the same time the local authorities recognised its efficacy in laying the dust. Mr. J. W. Cockrill, the Borough Surveyor of Yarmouth, who has had thirty years' experience of the use of salt and sea water, informs us that one load of the latter is equal to three loads of fresh water for dust laying. It keeps light gravel-made roads in splendid condition at about one-half the cost as compared with the use of fresh water. Moreover this authority is a cyclist and has never experienced any evil effects on pneumatic tyres. On the other hand, Mr. H. W. Smith, of Scarborough, whose experience of the subject when at Bournemouth is of value, while testifying to its efficacy for keeping down the dust, points to a corresponding drawback in its effect on rubber tyres.

So far as the Gordon Bennett race is concerned we would point out that the use of sea water for this one occasion would not prove any disadvantage to the roads or the local users. The competitors would not be troubled by the effect on their tyres so long as the dust was effectively laid, and altogether the idea is one that merits discussion and consideration. Perhaps some of our readers in seaside towns will be able to throw further light on the subject.

THE other evening the Duke and Duchess of Manchester, while motoring through Swinford, met with a mishap. After

leaving the town they went at a brisk pace on the Westport road for about 400 yards, when suddenly the car ran to one side of the road, and immediately after the front portion of the vehicle collapsed. A crowd of small boys soon appeared, and, at the request of the Duke, pushed the car back to Swinford Railway Station. His Grace wired for a special train to Westport, as the motoring party intended to dine with the Marquis of Sligo, but no train could be obtained, and at 10 o'clock the party had to travel by road to Balla Station, a distance of ten miles, to meet the train to Westport. The car was left at Swinford Railway Station, but before leaving for Westport the Duke engaged the services of a local blacksmith to see if he could do anything for it.

At the opening of the proceedings of the Athy Petty Sessions, the presiding Chairman, Sir A. A. Waldon, Bart., said a special meeting of the magistrates of the district had been convened to consider the advisability or not of issuing or granting occasional licences on the day of the motor-car race in July. They had unanimously resolved:—That it is our unanimous opinion that it would be most dangerous and most undesirable that any occasional licences should be granted to any parties in this Petty Sessions district for the day of the motor race." The Chairman said that the magistrates were of opinion that the granting of occasional licences would probably result in some very serious accidents happening to parties on the day of the contest.

DURING the first week the Go'fers' Hotel, Sutton, co. Dublin, will be the headquarters of the Midland Automobile Club, some of the members of which will travel *via* Bristol. Mr. Lancaster is going to Ireland with the view of making arrangements for the Club to have a special enclosure from which to view the race, and altogether it is evident that Midland automobilists will be well looked after. Sutton is a pleasant fishing village on the way to Howth from Dublin.

CONSIDERABLE discussion is taking place in Ireland with regard to the hour at which the race will start, the view of many being that a later beginning would enable thousands more people to see the event. It is no small privilege, says one leading Irish

Weighing the Trial Cars at Clipstone. Argent Archer.

journal, to have given over three hundred and fifty miles of public road for an entire day to a single club for a single race. No word of objection has been heard in the Emerald Isle, and its voices in the press are now urging some consideration of the convenience of the people in delaying the start to about ten o'clock. But what of the competitors? Surely they have some claim to consideration, and a later start would mean that they would be travelling in the hottest period of the day.

MOTOR MAY DAY.

FROLICSOME were the gambols associated with the May Days of the past, but those of the present are mundane and miserable. Much of the gaiety of life has been dispelled by newer conditions, and London especially presents a sombre aspect on the opening day of springtide. Looking from a suburban window last Friday morning the outlook was depressing and the climatic conditions dampening. With piteous persistency the rain descended—to lay the dust for the men who walked from London to Brighton. What folly, when so many motor-cars were available! But it was not the pedestrians' venture that caused everybody to be astir so early on that particular day.

Others ventured forth because it was Motor May Morning—the first of what should be a long succession of growing parades of heavy vehicles actually serving the public interest. The idea had come suddenly into the heads of the promoters, but that did not prevent thirty huge vehicles taking part in the demonstration along the Thames Embankment. As they left West-

represented included the Lancashire Steam Wagon Company—and Mr. Spurrier seemed well pleased with the municipal inquiries that concern is obtaining—Messrs. Coulthard and Co., and the Thornycroft and Straker companies.

For the encouragement of drivers to keep their vehicles in good order three prizes were offered, the awards being based upon the cleanliness of boiler and mountings, as well as the gearing, the state of lubrication of gear, and the general appearance of the wagon. The Hon. J. Scott Montagu, M.P., and Mr. W. J. Bull, M.P., were the judges, their decision being in favour of the drivers of vehicles belonging to the following firms:—1, Messrs. Whiteley; 2, Messrs. Searcy, Tansley and Co.; 3, Messrs. Dewar.

Subsequently we adjourned to the Savoy Hotel for breakfast, and from the windows of the Pinafore Room looked out upon a grey morning, with a mist hanging about the river with all the insistence of a winter fog. The long procession of huge automobiles was re-started, and away went the vehicles on their daily rounds, just as a counter-procession of horse-drawn vans, all caparisoned with bedraggled bunting, passed by, the occupants of the various carts being as dejected as Father Thames. The only excitement was afforded by the passing of a motor 'bus, with the

Society Motorists at the Empire Hotel, Bath. (See page 200).

minster Boadicea's chariot seemed very antique. Here was a long string of modern motor-vans all employed in the arts of peace, although the grey hues of three wagons destined for the Congo reminded the spectators that only lately had the war drum been throbbing to the pulsations of a victorious army in another part of the great African continent. But the other vehicles looked amicable enough. The names of Dewar, Watney, and Fuller on the great lorries would prove delightful a few weeks hence could their presence be tolerated about Ballyshannon, Kildare, and Timolin, where the magistrates have just refused to give extra facilities for obviating thirst on the part of weary and travelled motorists during the Gordon Bennett contest. One lorry belonged to a firm that uses it in transporting ballrooms from place to place, another to a great "universal provider," others to borough councils, photographic dealers, wall-paper manufacturers, and equally diverse forms of industrial undertaking. A motor-wagon belonging to the Middlesex Hospital laundry was a notable feature—but the rain prevented anything like an adequate interest in the fine show of heavy vehicles, not so varied and representative as the show at the Agricultural Hall Exhibition, but in many ways the best display of heavy motor-vehicles yet seen in London. The makers

legend "General Omnibus Company," it having made its initial trip on May morning. Undoubtedly steam lorries require considerable water in the course of their peregrinations, but for the supply arrangements should be made with the local authorities, and not with the Clerk of the Weather. The weather was too profuse in its dealings for anything like comfort, a point which should be considered on the occasion of future displays—for these parades are to be annual parades. If Motor May Day is to become an institution, may not the automobile parade supplant the August Cart Horse Parade in Regent's Park? None dare controvert the implied suggestion.

THE Swiss Automobile Club will hold a series of kilometre trials on a level road in the Canton of Geneva, on the 18th inst. The competition is open for both cars and motor-cycles, and entries must be sent in by the 17th inst. at the latest.

MESSRS. BENZ AND Co. have just supplied two cars—of 7-h.p. and 17-h.p. respectively—to the German military authorities at Munich. Before being accepted the vehicles were subjected to a 500 kilometre trial over all kinds of roads.

SOME USEFUL NOTES.

IN attempting to take off a cylinder head never drive any kind of tool between the cylinder and head.

EVEN with excessive lubrication, valves never become foul unless they fit their seating imperfectly. Hence a foul valve is a sure indication that it requires grinding.

ALMOST any cable will safely carry the low tension current, but no cable can be too well insulated or of too good a quality to carry the high tension current to the sparking plug.

A USEFUL little pressure gauge for testing the compression of petrol engine cylinders, sparking plugs and tyres has been brought under our notice by Messrs. J. Lacoste and Co. Its construction is clearly indicated in the illustrations, which show a sectional as well as a general view. To verify the compression the apparatus should be screwed in place of the sparking plug, and after having placed the cap on P the engine should be turned by the starting handle until the highest point of compression is obtained; the needle of the pressure gauge will then register the amount of compression and also point out any leak by the index finger gradually falling to zero. To test the sparking of the plug

under pressure, the plug should be screwed in B, an ordinary bicycle pump should then be connected at P, and the press raised by pumping to approximately the same compression as that of the cylinder; the spark can then be watched through the window R. If the index finger of the gauge falls, the joints of the plug are leaky. A rubber collar C is provided to the apparatus by which it is intended to be held to prevent the user experiencing any electrical shocks.

It should be remembered that exhaust gases contain ingredients of a highly poisonous nature. Therefore when the engine is run whilst in the stable, always have a door or window wide open so as to ensure free ventilation.

IN connection with the current scare anent the quality of petrol it may be as well to mention that the presence of water in petrol is, to a certain extent, inevitable, and it becomes an ingredient of petrol partly after it has left the refiners' hands. Thus the constant vaporization which goes on in the petrol tank of a car (especially when the car is in motion) produces a lowering of temperature sufficient to cause condensation of aqueous vapour, this condensed vapour collecting on the sides of the tank and forming droplets which ultimately collect at the bottom of the tank and may find their way to the carburettor.

A SPARE length of rubber-tubing (preferably several lengths of various sizes) may be very useful if the insulation of a wire should become damaged, or in case of a leak in a petrol or water-pipe.

NEVER run up to or near your stopping place at full speed and then put the brakes on hard, just to see how quickly you can stop. A motor-car should always be stopped as gently as possible, and started in the same way.

IT is well-nigh impossible to cover in any effective manner the subject of road repairs, for the reason that it is generally the unexpected that happens. Only a small part of the ills that a motor-car may become heir to can be predicted or treated of in a short article, and when anything goes wrong it is frequently found that it is just the particular thing that the motorist is not prepared to meet. There are always certain nuts upon every car which seem to have a special fondness for working off their threads. Even if they are provided with lock nuts, both nuts will sometime work off if the thread does not fit properly or if it is too coarse. When a cotter-pin is provided through the screw alone, beyond the nut, it effectually prevents the nut from being lost, but does not keep it from becoming loose. Cotter-pins, to prove really valuable, should pass through a hole drilled through both the nut and the screw.

AFTER a lost nut is replaced, it can be prevented from working loose by winding wire into the thread of the screw close to the nut and twisting its ends tightly together with the pliers, or the protruding part of the thread may be battered with a hammer, though this is hardly workmanlike. If no nut is at hand to take the place of the missing one, sometimes a crude process of riveting can be resorted to, which may hold things together for a while. The end of the screw or bolt can be cut off short with the cold chisel, and with the aid of a hammer or the head of a wrench and a convenient stone, the end of the screw may be upset and headed over so that it will hold. If the bolt happens to have been lost with the nut, it is sometimes possible to make a temporary "hitch" by passing heavy wire through the bolt hole several times and twisting its ends together with the pliers. Wire is one of the most useful things that can be carried.

UNFORTUNATELY, there are many cars in service in which complete precautions regarding the tightness of nuts have not been taken, and occasionally, despite inspection in the stable, a nut will be lost and something will suddenly break loose. It is then that the spare nuts in the tool-box become valuable. The manufacturer who can put his machine together and use only a few standard sizes and threads in so doing deserves credit, as a very small stock of nuts will then meet all emergencies, and, if they are of standard description, they may be purchased at almost any ironmonger's.

THE connections of ignition wires to terminals should be wrapped round with rubber tape, and a little solution, such as used for mending tyres, can be added with advantage. This wrapping up of cable ends and connections, as well as keeping the moisture and wet from entering along and down the insulation, also keeps the nuts securing the cable ends from working loose and getting lost, as they cannot turn round when wrapped up.

If you ever take your engine to pieces be very careful to get everything back in the correct place. One must be very well acquainted with a petrol motor to get the various parts back into the correct position. The work should not be attempted unless it is known that all the parts are marked, for if the pinions of the valve gear are only one tooth out the motor will not run, or, if it does, it will give practically no power.

THE Wilkinson Motor and Engineering Works have been opened at 31, Priory Park Road, Kilburn, N.W. The teaching of driving, as well as the execution of repairs is undertaken by the company.

CONTINENTAL NOTES.

By "AUTOMAN."

THE accompanying illustration shows a motor-fire service wagon lately completed at the Eisenach Fahrzeug Fabrik, Eisenach, Germany. The frame is of stamped steel, in the fore part of which is a vertical two-cylinder engine having mechanically operated inlet valves. It develops 14-h.p. at a speed of 680 revolutions per minute. The latest type of combined honeycomb radiator and water tank, with fan, is fitted. Three speeds forward and a reverse are provided, the transmission to the rear axle being by a cardan shaft and bevel gear. The change speed gear is controlled by a hand-wheel, while the road wheels are shod with solid rubber tyres. The vehicle is adapted to carry eight firemen, including the driver, in addition to ladders, hand-pumps, and a large quantity of hose.

The Eisenach Motor Fire Service Wagon.

THE special train from Paris to Madrid, which is to be run in connection with the race, will start from Paris on Saturday night, May 23rd, and will stop at Versailles, in order to allow the passengers to see some of the first cars off on Sunday morning. It will leave the "Gare des Matelots" at 4.30 a.m., and will arrive at Bordeaux at ten minutes past twelve, where it will stop opposite the place where the cars arrive. It is thus hoped that it will be in time to enable passengers to witness the arrival of the first car, which should not take place until nearly one o'clock, unless the average speed of last year is greatly exceeded, which is not very likely. On Tuesday morning, May 26th, at a quarter past midnight, the special train will leave Bordeaux from the Saint-Jean Station, and will cross the Spanish frontier and stop at Vittoria at eight o'clock in the morning, giving the passengers just eleven and a half hours in Vittoria, which will enable them to see the arrival of the greater part of the competitors after the crossing of the Pyrenees. At 7.30 in

the evening of Tuesday the train will leave Vittoria for Madrid, where it will arrive at eight o'clock in the morning. As the accommodation in the special train is very limited, Englishmen who wish to avail themselves of it should send in their applications as quickly as possible, together with a cheque addressed to M. Huet, 6, Place de la Concorde, Paris. For the information of those who have not already followed big international motor-car races in the special train, I would add that it is composed of sleeping and restaurant cars, and fully accommodates passengers in every way as far as Madrid; so it is needless for them to seek for hotel accommodation otherwise than at Madrid.

WITH regard to the introduction of tyres and spare parts, and all materials connected with automobiles, including petrol, alcohol, and oil, an arrangement has been come to with the Spanish authorities, whereby these will be entered free of duty

on the presentation of a certificate prepared by the A.C.F., where a guarantee must be given for the payment of duty on any of those goods not re-exported within forty days of the date of the race. The importation may be made from May 1st to 20th, and the certificate necessary for this purpose may be had from Mr. Hocmelle, Secretary of the Racing Committee of the A.C.F., Place de la Concorde, Paris.

THE greatest mystery surrounds the different racing cars, and Mors still seems to be the only firm to have cars actually on the road. The new Mors cars are said to be as much faster as if last year's cars had a fifth speed added. This information is almost incredible. With regard to what Panhard and Levassor are doing, no one seems to know very clearly. The "Auto" has a story about them, which supposes that the engine is slanted downwards towards the front of the car, in order to give more room for the fly wheel, which seems more incredible than the

story about the Mors cars ; for it is difficult to see how they could possibly be efficiently lubricated in this manner. It is reported that the Gobron-Brilliés, which have four cylinders and eight pistons, have been reduced in weight, but are still 25 kilos over the limit, and they are working to reduce this. It is said that the motor gives 100-h.p., and only weighs 360 kilos, which would make it very light indeed.

At the Hotchkiss Works every moment of time is being utilised day and night to push forward the racing cars, and the first one is likely to be on the roads in a few days. The engine is exceedingly light and compact, and has four cylinders, each made from a block of forged steel, out of which both the inlet and exhaust openings are cut. The water jacket is of aluminium, and is placed over the four cylinders, which it unites in such a manner that there is no interior water joint. The motor weighs only 300 kilos, and gives 80-h.p. I was fortunate enough to see it running the other day on the testing bed, and was surprised to notice the facility with which the speed is varied instantaneously

just the same bearing surface between the two dishes. This arrangement has many advantages, and needs no attention or lubrication, and makes it very much easier for the springs, which in most of the live axle cars transmit the forward motion to the car. The Hotchkiss car has four speeds, and has a frame made out of stamped nickel steel. It is very low and long, and has quite a rakish look about it, which gives one the idea of high speed.

Most of the well-known *chauffeurs* are busy reconnoitring the road from Paris to Madrid, and M. Etienne Giraud has recounted his adventures in a journey made in a 15-h.p. C.G.V. from Paris to Madrid. M. Giraud is not very pessimistic about the Spanish roads, and seems to think that they are not as bad as they have been made out. He only had one puncture in Spain. He calls attention to the fact that in some parts of the country chains are drawn across the road at night. Fournier and Georges Prade have just started off to reconnoitre the road. Demester, who has just returned from a reconnoitring tour, tells

Snapshots of a Winton Car in the Rocky Mountains.

from 150 to 1,200 revolutions. The car will, it is said, come well under the limit of weight, and it will not be necessary to skimp it in any way. Amongst the novel features is the front axle, in which there is no pivot; it is particularly strong and has the advantage of allowing the wheels to turn on a point which falls exactly in the centre of the tyre, so that the tendency of the front wheels is to come back to the straight position, just as is the case in the wheels of a bicycle. Ball bearings are utilised in the wheels, in the change of speed gear, and also on the crank shaft, which is thus very much shortened. The transmission of the Hotchkiss car is by means of a live axle working through a cardan joint, which, however, contains no bolt or other fastening. The position of the back axle is fixed longitudinally by two powerful thrust rods, one on each side, and the only way in which it can move is in an arc which takes for its centre the centre of the cardan joint. This latter consists of a square dish, which fits inside another square dish in such a manner that, whatever be the position of the back axle, in the short arc which it can describe around the centre of the cardan, there is

how the steam rollers and rollers drawn by mules are busy preparing the Spanish roads, which are getting into very much better condition. He found no difficulty in the hill-climbing of the Guadarrama, with the exception of two or three dangerous turns ; but, on the whole, he reports the roads to be feasible.

THERE is trouble in Germany over the Gordon Bennett race. The truth of the matter is that Germany is a country very far behind in automobilism, and the fact that the Daimler Motoren-Gesellschaft in Cannstatt makes a very fine, perhaps the finest car in the world, has not even had the influence in Germany of propagating the sport ; for nearly the whole production of the Cannstatt firm is exported from Germany in to France, England, or America. Of course, the roads in Germany are not very good, and the further north one goes the worse they get. No doubt this has a deterrent effect on automobilism ; and perhaps, too, in Germany sport is not so sought after as in the countries above alluded to. The Cannstatt-Daimler Company blames, however, to a great extent the German Automobile Club, which, founded

by Society people in Berlin, has remained a social club, and excluded rigidly from the advantages of membership all those who could not lay complete claim to the title of amateur. This, it is said, has had a disastrous result on the trade in Germany, for there has been no central body occupying itself with the organisation of competitions and the popularisation of automobilism. This unfortunate situation has come to a head *a propos* of the Gordon Bennett race, for the Cannstatt-Daimler Company could not find amongst the members of the Deutsche Automobil Club drivers suiting their requirements for the race in Ireland. The drivers whom they have chosen refuse to become members of the D.A.C. under the existing regulations, which refuse them almost all the privileges entertained by members, and under these circumstances the Cannstatt-Daimler Company threaten to withdraw their cars from the Gordon Bennett race and not compete. An effort, however, is being made by some of the members of the D.A.C. to avert such a catastrophe, by asking the members of the club at their general meeting to alter the rules, so that they may conform with those of the affiliated clubs in other countries, and I think it is pretty certain, therefore, that the famous Mercedes cars will be seen in Dublin at the beginning of July.

THE announcement that during his visit to Paris King Edward VII. has honoured a French firm with an order for a motor-car has given much satisfaction in France. His Majesty examined the vehicle on Sunday at the British Embassy, in the courtyard of which it performed several evolutions under his observation. It is a Darracq four-cylinder car of 24-h.p. with a limousine body. His Majesty made a close examination of the car, and inquired as to its top speed, which was stated to be forty-two miles per hour.

ON Sunday last the Austrian Automobile Club held its annual hill-climbing competition up the Exelberg from Neuwaldegg. In the heavy car class Count Wimpffen was first, on a 10-h.p. Serpollet steam car, his time being 5 m. 52 sec.; Hieronymus, on a Mercedes, won in the 650-1,000 kilog. class (time 5 m. 32½ sec.); Schwertlenka, on a De Dion, was first in the voiturette class (9 m. 30¼ sec.), while Toman headed the motor-bicycle section, his time being 5 m. 53 sec. The record for the climb stands at 5 m. 28 sec., and was not beaten on Sunday.

THE Circuit National Belge, organised by the Automobile Club of Belgium, starts to-day (Saturday). Eight classes have been arranged, according to the price of the cars. The first day's programme comprises a run from Brussels to Antwerp, and a visit to an ocean liner. On Sunday, the journey will be made from Antwerp to Liege via Hasselt. On Monday the run will be from Liege to Arlon, via Houffalize, the next day's trip being to Namur, via Rochefort. On the 13th inst. there will be hill climbing and kilometre contests. On the 14th inst. the competitors will return to Brussels. Altogether the run extends to 571 kilometres.

FOR the Paris-Madrid race, Messrs. Renault are preparing three 30-h.p. cars, to be driven respectively by Messrs. Louis and Marcel Renault and M. Grus. The engines have four cylinders and ordinary suction inlet valves. The wheel base is 7ft. 10in. and the track 4ft. Three cars of the Paris-Vienna type and four 10-h.p. light cars have also been entered by the Renault firm. De Dietrich's have built half-a-dozen powerful cars for the race. They are nominally rated at 45-h.p., but it is rumoured that this estimate is well within the mark; their drivers will be Messrs. Jarrott, Lorraine-Barrow, Stead, Gras, De Brou and Haentjens. Three 24-h.p. cars have also been entered by Messrs. De Dietrich, one of which will be driven by Madame du Gast.

MR. T. W. H. OLIVER, who was responsible for the construction of part of the Brighton line from East Grinstead, has become a motorist, having purchased a 10-h.p. Panhard car from Mr. John D. Hill.

THE MOSLER CARBURETTOR.

HEREWITH we illustrate a somewhat novel carburettor of American design; it consists of a float chamber, float, spraying nozzle, rotary fan, regulating valves and means for their adjustment. The petrol is admitted to the float chamber A at the top. Near the base is an outlet, which is lower than the spraying nozzle. The level of petrol in the float chamber is higher than the nozzle, so that it flows to the latter by gravity.

When the motor is running air is drawn into the spraying chamber and eventually passes to the motor through the elbow B. On its way up it induces the fan G to revolve rapidly. The latter rises against the pressure of the coiled spring C, and with it goes the needle valve D which allows the spirit to enter the spraying chamber. The fan serves not only the purpose of opening the valve, but mixes the petrol vapour with the air. To adjust the needle valve and the flow of petrol, the screw which presses on the coiled spring may either be set or a valve between the float and the space between the nozzle—not shown in the illustration—may be regulated. To prevent binding,

a ball is inserted between the stem to which the fan is secured and the pin on which the coil spring rests. The spring is surrounded by a sleeve, which may be adjusted so that a wide range of adjustment of the former is provided for. The chamber in which the fan revolves is a glass tube, which has joints that are packed with cork. To further regulate the mixture a plate with numerous small holes is attached to the elbow casting. By turning it to its proper position the speed of the fan can be regulated. The new carburettor is made in a number of sizes by Mr. A. R. Mosler, of 309, Broadway, New York.

MESSRS. EVART-HALL, LIMITED, have opened a new depot and garage at 105, King's Road, Brighton, under the management of Mr. Thornton Nixon, late of Messrs. Hewetsons, Limited.

CONSIDERABLE attention is being given to the St. Louis International Exhibition by motor-car builders in France and Germany. A number of French firms have already secured space, while now it is announced that the Cannstatt-Daimler Company will be represented by a number of Mercedes cars, and that the Opel and Cudell companies will send some of their latest models.

MESSRS. CLARKSON, LIMITED, of Chelmsford, have sent us an illustration of the radiators they have supplied to Messrs. Napier and Sons for use on their Gordon Bennett Cup defenders. It will be remembered that this concern fitted the radiator for the original Gordon Bennett winner last year, this being made up at twenty-four hours' notice. Messrs. Clarkson have installed a special plant for the manufacture of all description of radiators.

MOTOR-CYCLING NEWS.

THE Norfolk County Council have under consideration the question of providing their district surveyors with motor-bicycles.

LETTERS recently received from Messrs. Best and Towne, of Christchurch, the New Zealand agents for the Mitchell motor bicycle, show that motor-cycling is making good progress in that colony, they having disposed of no less than thirty-five machines during the past year. A five-mile standing start record for New Zealand has been established on a Mitchell, the time being eight minutes nine seconds.

MR. F. HULBERT, of Putney, writes :—"I send you a photo of a lady's motor-bicycle recently designed and built by the Booth Motor Company. It is splendidly finished in all details, quite rigid, and practically free from vibration. My wife, Mrs. Hulbert, who is seen on the machine, has ridden it over 900 miles without a breakdown, her longest journey in the day being

120 miles. The engine, bolted to the down tube, is a 2 h.p. Minerva, with mechanically-operated inlet valve; the petrol tank, seen in front, has a capacity for a run of 120 miles; the coil and accumulator are arranged under seat pillar, and a very neat guard protects the dress from the belt.

THE Motor Cycling Club have decided to fix upon Eastbourne as the rendezvous for their Whitsun tour.

THE Turin Cycling Club is organising a motor-cycle race on the road from Milan to Turin. The race, which will extend over a distance of 145 kilometres, will be run off on the 24th inst.

A LADY motor-cyclist, Madame Jolivet, is competing in the Paris-Madrid races. She will ride a 3-h.p. Griffon motor-bicycle, similar machines being also entered by Messrs. Demester and Lamberjack.

THE Motor-Cycle Committee of the C.T.C. propose to carry out a tour in France at Whitsuntide.

THE Belfast branch of the Motor-cycle Union of Ireland is arranging to hold a hill-climbing competition in Co. Down. The hill on the Castlewellsan-Clough road will probably be selected as the course.

The Excelsior Motor-Bicycle with Fora-Carriage.

HEREWITH we give an illustration of the Peugeot motor-bicycle which Messrs. Friswell, Limited, have lately introduced into this country. The 2-h.p. air-cooled motor is built in the frame in a vertical position, just forward of the bottom bracket. It is securely bolted to lugs forming a dovetail joint, thus securing perfect and permanent alignment. The mixture is furnished by a Longuemare carburettor, in conjunction with which is a throttle valve. The power is transmitted to a pulley on the rear wheel

by a twisted leather belt. The accumulator, coil, petrol, and lubricating oil are contained in separate compartments in one tank, sufficient petrol being carried for a run of 100 miles. For lubrication a special oil pump is fitted, while there are brakes acting on both front and rear wheels. Although the machine is relatively light—under 80 lbs.—it is of substantial construction, and appears to be well finished as regards the various details.

THE Halifax Automobile Club has had a capital run to Southport; four cars, driven respectively by Mr. James Rhodes, Mr. Donald Sagar, Mr. Thomas, and Mr. Redman participating, while Mr. H. A. Lumb, of Triangle, was present on his motor-bicycle.

HERE AND THERE.

A TRACK for motor-car-racing is being prepared at Bexhill.

LADY MINTO, the wife of the Governor-General of Canada, is an ardent automobilist.

Chassis of Arrol-Johnston 12-h.p. Chassis. (See issue April 4th, page 92.)

AN extensive garage has been opened by Messrs. H. Beard and Co., at 20, Hill Rise, Richmond, S.W., and motorists will there find expert assistance always available.

On Saturday the Wolverhampton Automobile Club had a run to Bridgnorth, the "Star" car driven by Mr. J. Lisle being the most notable vehicle participating in the event.

THE Holland Park Motor Company, of Holland Park Avenue, W., have now added a motor-clothing department to their rapidly growing business.

ECHOES of the Agricultural Hall Exhibition continue to reach us, several firms having written of orders received as the result of inquiries first obtained at the Show.

It is reported that a syndicate is about to start a large service of motor omnibuses in London. The vehicles are to be built by the Durkopp Company, of Bielefeld, Germany; they will be of 16-h.p., and have accommodation for 20 passengers.

FOUR police traps, each 440 yards in length, have been established near Maidenhead, their location being as follows:—From Taplow station on the Bath road to Maidenhead Bridge; from the bridge into the town; from the top of Castle Hill to Punt Hill, and from Boulter's Lock to the bridge.

FROM Mr. John Lane comes the "Tramp's Handbook," a small volume by Mr. Harry Roberts, who has managed to get together much interesting information concerning life in the open country. Useful though they may be, some references to the specialities

of firms have a resemblance to advertisements. Otherwise the book is one which motorists, as well as those who tramp by road, will find useful, as well as good reading in spare moments.

LAST week we were able to briefly chronicle the outbreak of fire at the works of the Daimler Company at Coventry. Arrangements have been made to enable the work to proceed without appreciable delay.

THE World's New Accumulator Company, Limited, has been registered with a capital of £7,500 in 1s. shares, to carry on the business of manufacturers of electric accumulators, motor-cars, and carriages of every description.

So many motor-cars were seen on the road during the Stock Exchange walk to Brighton, that the comparatively few horse-drawn vehicles specially chartered in connection with the event were almost objects of curiosity.

MESSRS. DRAKE AND FLETCHER, of Maidstone, have just completed a new agricultural motor. It is built somewhat on the lines of a traction engine, though on a very much smaller scale, and is driven by a three-cylinder petrol engine. The new motor will shortly be subjected to field trials.

A HOUSE of Commons Committee has commenced the consideration of a bill to incorporate the Stroud District and Cheltenham Tramways Company, with powers to run motor-cars worked on the overhead trolley system, without running on rails, along the road

through the valleys radiating from Stroud to Cheltenham, Stonehouse, Nailsworth, and Chalford.

MESSRS. SMITH, PARFREY AND CO., LTD., send an illustrated price-list of their motor-car lamps, and also of artillery motor wheels and springs. In the latter department they have several

Messrs. Pritchett's and Gold's 14-h.p. "Meteor" Car. (See issue April 4th, page 92.)

good designs, including motor axle forgings. At their works in Fulham Palace Road, Hammersmith, they have laid down an electric welding plant, which enables them to secure high-class workmanship.

A MOTOR-CAR works is about to be established at Willenhall.

MR. J. PIERPONT MORGAN, the son of the great American magnate, has just ordered a Lanchester car.

THE headquarters of the Kent Automobile Club will probably be at the Star Hotel, Maidstone.

MESSRS. SCAIFE AND PEARSON are leasing a garage which has been built at the rear of the White Swan Hotel, York.

MR. MAURICE HUNTER, of the Eastdown Works, Lewisham, is arranging to take out small parties for week-end motor-car trips.

THE nearest garage to the House of Commons is that of Messrs. Wolstencroft and Company, at Great Peter Street, Westminster.

INSTRUCTION in the working and manipulation of motor-cars is being given in connection with Harrod's Motor Department, Knightsbridge, W.

A DISCUSSION on the advisability of inviting the Government to deal with the alleged damage to the roads by motor-lorries is threatened at the next meeting of the Chorley District Council.

THE accompanying photograph was taken on the occasion of the opening of the Ryknield Engine Works at Burton, as

reported in the *Journal* a fortnight ago. Reading from left to right, the gentlemen seated in the front are Mr. C. J. Clay, Lord Burton, Mr. R. J. Morris (deputy-mayor), Mr. A. G. Clay (chairman), Mr. W. W. Worthington (vice-chairman), Mr. C. Cordingley and Mr. T. E. Lowe. Mr. E. Bagulay, the works' manager, is standing between the deputy-mayor and chairman. Standing close to the doorway on his right is Mr. W. H. Clay, one of the directors of the new concern.

AMONG the hotels of Messrs. Spiers and Pond is the Empire Hotel at Bath, which is a favourite resort of motorists in that locality. There is an excellent garage near the hotel, and the photograph on page 193 was taken as the Earl of Portsmouth and the Rev. Sir David Hunter Blair were leaving for Wells. The reverend knight is seen well muffled up against wind and dust. The Mors car to the right of the scene is that of Lord Berwick, who is standing on the pavement towards the rear of the vehicle.

THE annual report of Messrs. Brown Brothers, Limited, shows a profit for the year ending December 20th last, after making a provision for the depreciation of leaseholds, plant and patents, of £25,283. After making the necessary deductions and crediting the amount brought forward from the previous account, a net balance of £22,847 remains for disposal. Out of this sum, a dividend of 6 per cent. per annum has been paid on the preference shares, and a similar percentage has now been declared on the ordinary shares. Ten per cent. of the net profits available for dividend on the latter capital has been carried to the reserve fund as well as an additional sum of £5,000.

THE Auto Lubrine Company send a neat pamphlet of testimonials as to the value of Auto Lubrine in connection with automobiles.

A PHOTOGRAPH of lions in a motor car is one of the latest attractive advertisements issued in connection with a London place of amusement.

KRUPKAR, LIMITED, is the name of the latest concern to enter the motor-car trade in London, they being about to open a depot at Harrod's Stores, Trevor Square, Brompton Road, S.W. They are introducing a new car known as the "Krupkar," in 6-h.p., 10-h.p., and 16-h.p. sizes.

A 48-MILE run will be taken to-day (Saturday) by the Wolverhampton Club, the destination being the Wrekin Hotel, Wellington. Mr. G. Evans will act as captain. Next Saturday's outing will be to the Barley Mow, Newport, via Stafford, and on the 23rd inst. there will be an inter-club run with the Midland Automobile organisation.

THE Works Committee of Westminster City Council at their meeting on Monday, received a report from the city engineer advocating the use of motor vans to carry one ton, and to ply at ten or twelve miles per hour, for the removal of street sweepings from streets with heavy traffic. A motion in favour of tenders being called for the vans was adopted. The contractors will be required to provide one experimental van at first, and to maintain it for a given period.

FROM the Country Gentlemen's Association, Ltd., comes the Country Gentlemen's Estate Book for 1903—a splendid volume, well edited by Mr. W. Broomhall, who has had the assistance of many leading experts in estate work. Within six-hundred pages appears a quantity of useful and valuable information with regard to the management of estates and the work of farmers and gardeners. Sports and pastimes are also dealt with, and the omission of the automobile appears to be the one failing to make the work thoroughly complete.

THE Ordnance Survey have recently issued a folding pocket map of Brighton and the surrounding district. This is one of the series of maps of certain areas in England and Wales on the scale of two miles to one inch, the publication of which has just been commenced. The map is mounted on linen, folded outwards so as to admit of its being read without necessarily opening the whole map. Copies of the map may be obtained from the local agents, or, through any bookseller, from the Ordnance Survey Office, Southampton. Copies may also be ordered through head post-offices in towns where there are no agents.

ON Saturday night a motorist was driving past the Imperial Theatre, Westminster, when two boys came down the street, at the side of the theatre, in a home-made motor-car, consisting of a starch box on four wheels. Having lost control of their vehicle, they went skidding across the road, and would have gone under the wheels of the automobile but for the driver's prompt and plucky action. He turned his car and charged into some heavy posts opposite the theatre. The vehicle was considerably damaged, and the driver thrown out, but he escaped injury. The boys were thrown from their box, and at Westminster Hospital were found to be suffering from shock, bruises, and a few minor cuts.

THE first combination petrol-electric omnibus built by the Fischer Motor Vehicle Company to the order of the London General Omnibus Company arrived in London last week, and is now at the Fischer Company's depot at Walnut Tree Walk, Kennington. The petrol motor and dynamo are carried in front, and are entirely enclosed in a compartment with movable sides under the driver's seat. Seats of the usual "garden" type are provided on the roof, and these can accommodate eighteen persons, while fourteen other passengers can be carried inside. The engine, which is of 20-h.p., comprises four cylinders. Directly coupled to its shaft is a 16-kw, six-pole dynamo. Current from this generator is taken to a pair of 10-h.p. motors which drive the rear wheels independently, while any surplus current is stored in a small battery carried beneath the inside seats.

THE MOTOR-CAR INDUSTRY IN SCOTLAND.

SCOTLAND is running the sister country a close race in the establishment of large motor-car works. Already North of the Border four concerns are turning out motor-cars on a large scale—the Hozier Engineering Company at Bridgeton, the Mo-Car Syndicate at Paisley, the Albion Motor-Car Company in Glasgow, and Stirlings Motor-Carriages, Limited, at Granton Harbour, near Edinburgh. Recently we had occasion to visit Edinburgh, and, through the courtesy of Mr. John Stirling, managing director, had the pleasure of visiting the extensive works of the last-named concern. The site of the

and lighting power purposes; the works throughout being driven electrically. Adjoining the power station is the battery house, furnished with E.P.S. storage batteries for lighting purposes after the engines have ceased running. On the north side of the works, close to the railway, and right in the centre of the main buildings, are situated commodious general stores and the despatch room. Here not only are all goods coming in either by road, rail, or steamer received, and thereafter distributed to the various departments of the works, but the cars, etc., are prepared for despatch to their destination. To the left of the stores is a substantial block of buildings, two stories high, 215 ft. long by 50 ft. wide. The ground floor of this contains a large, well-lighted erecting shop, the wood-working machine

View of one of the Machine Shops in the Works of Stirling's Motor Carriages, Ltd.

works covers an area of nearly seven acres; it is situated close to Granton Harbour, adjoining the Caledonian Railway. The buildings have been specially designed for motor-car manufacture and built in a most substantial manner. After passing the Entrance Lodge a good block of buildings is met with on the right, built of fine English brick with red sandstone facing and artistic balustrading. This contains a suite of offices comprising managing director's office, board room, separate offices for the managing director, secretary, and works' manager, correspondence room, general office, etc. In the same block is the house of the resident works' superintendent. To the right of the offices and standing by itself is the power generating station, containing a large installation of gas engines driving dynamos for electric

shop, equipped with the latest labour saving machinery in this line, and also a large smithy with tin and coppersmith's shop and case-hardening room. On the upper floor of the same block are located the drawing office, the pattern-making shop, motor erecting shop and workmen's mess room. Crossing a wide glass-covered bay, used as a running and testing shop, we enter the west block, which is similar in dimensions to the east, just described, and has two storeys. On the ground floor are a fine range of machine shops fitted with modern machine tools, and also the motor testing room. On the upper floor of this block are the large coachbuilding shops, adjoining which are the paint shop, varnishing room, and upholstery department. On the north-west corner of the site, and detached from the main works,

THE MOTOR-CAR INDUSTRY IN SCOTLAND.

(SEE PAGE 201.)

View of Carriage-Building Department in the Works of Stirling's Motor Carriages, Ltd.

General View of the Works of Stirling's Motor Carriages, Ltd., Granton Harbour.

a very complete foundry has been established, while a broad testing track, three laps to the mile, encircles the main buildings.

Close upon 200 persons are at present employed, and the works, which are under the management of Mr. A. J. Drake, late works' manager of the Daimler Motor Company, have been running overtime almost continuously for the past six months to keep abreast of the large orders for public service omnibuses which the company have received, and which include 24-h.p. vehicles for the North-Eastern Railway Company, 27-h.p. omnibuses to the order of the Earl of Leitrim, for use in Ireland, and 24-h.p. omnibuses for South Africa, Western Australia, and New Zealand, as well as for Edinburgh and London.

THE "KING" AUTOMATIC IGNITION-TIMING DEVICE.

THE device illustrated herewith, which is the invention of Mr. Charles B. King, and manufactured by the Dayton Electric Manufacturing Company, of Dayton, Ohio, U.S.A., is stated to automatically vary the point of ignition, and is described as follows:—A throttle valve on the engine, controlled by the governor, indirectly acts upon the contact maker, which is automatically advanced or retarded, as the speed is varied. The device illustrated is arranged for a four-cylinder engine, using only one induction coil. The leads to each cylinder are plainly shown. The terminal for the high-tension current wire is directly opposite to that of the primary circuit, to which

is attached a spring brush which bears on the commutator. The other ends of the primary and secondary wires are "earthed" on the engine. The bearings and connecting rods of many automobile engines are frequently abused by the improper use of the hand-timing method, which can be obviated by the use of the automatic device; while by removing the spark control lever from the car the driver can give more attention to the road. The device, which is provided with a glass cover enclosing all the parts from dust and dirt, is so made that it can be attached directly to the engine or to the dash-board. In addition to the automatic timing, it also acts as a spark intensifier. The Dayton Company claim to be the originators of spark-gap intensifiers, they having made use of them for some years. The intensifier is formed by a spark-gap between the terminal points and the T-headed revolving sector. This gap increases the cumulative power of the secondary current and causes the spark to jump between the proper points of the sparking plug, although the latter may be partly short-circuited with oil and soot.

REPLYING to a question by Mr. H. Broadhurst as to the difficulty of M.P.'s finding accommodation near the House of Commons, Mr. A. Balfour has suggested more rapid transit as the only remedy. One hon. member interpolated the remark "Motor-cars," but whether he suggested these are to be provided from the Exchequer did not transpire.

CORRESPONDENCE.

THE ABOLITION OF CHANGE-SPEED GEARING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see that in your issue of the 25th ult. a correspondent has at last brought forward the subject I have been for some time looking for, viz., the abolition of change-speed gearing. So far as I could ascertain at the late exhibition at the Agricultural Hall, I saw really nothing good in change-speed gears worth much attention. I do not believe in sliding gears in mesh at all; this system may be very well in the hands of an expert, or those who are good judges of speed suitable to the gearing. On the other hand, suppose a gentleman buys a car so fitted; by the time he or his coachman, has properly learned to strike his gears, they are usually found badly stripped and torn on the side of the cogs: as a fact, they have done as much damage, say, in a month as an expert would do in a year.

To return to the subject of abolition of change-speed gearing, I have a strong idea that this can and will be done before very long in some way or other. One of the best ways to this end, I think, is by compressed air. Suppose you have a good De Dion or other engine running at say 1,500 revolutions per minute connected direct with an air pump or piston, the piston being suitable and up to the power of the De Dion engine, and the air being forced into a specially strong steel cylinder fitted with a safety valve. The waste air from this could go to cool the petrol engine, and this would most likely answer without carrying much water or radiators. The compressed air can then be fed to the compressed air engine, entirely independent of the petrol engine, the latter being simply used for compressing air.

By this arrangement the greatest flexibility can be secured. The compressed air engine would no doubt keep itself quite cool under all conditions, the rings being better lubricated, while using far less oil. The ordinary change-speed gears can be entirely done without and the car driven in exactly the same way as steam vehicles, but without boiler, furnaces, burners, etc. I should like to have the opinions of your expert readers.—Yours faithfully,

M. L. VEALEY.

HIGH-SPEED TREMBLER COILS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having experienced considerable difficulty at times in starting my 8-h.p. De Dion engine with De Dion contact breaker and dry battery, I propose to fit instead a high-speed trembling coil and accumulators, with a wipe contact.

I should be greatly obliged if any of your readers who have tried this would give me the result of their experience. I am informed that, although De Dion and Bouton still keep to the dry battery and trembler on contact breaker, yet most of their cars on coming to England have the other system of ignition fitted. I should also like to know if the change would detract from the power of the engine.—Yours faithfully,

ONE TIRED OF ADJUSTING THE TREMBLER.

THE JOHNSON TESTIMONIAL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—At the annual general meeting of the Club I announced with regret the resignation of the Club Secretary, Mr. Claude Johnson. His resignation has now practically taken effect, though until June the Club will have the advantage of a portion of his time each day. The moment seems now to have arrived for putting into effect the project mooted at the general meeting of presenting Mr. Johnson with a testimonial, and I therefore invite the co-operation of your *Journal* in bringing this matter before the notice of automobilists generally throughout the country. It is unnecessary for me to enlarge upon the great service Mr. Johnson has rendered to the automobile movement, yet I do not like to send this letter without paying a warm tribute to his energy, ability, and unvarying courtesy to all with whom he has come into contact. Further, I may mention that it is due to his foresight and energy that a road was found in Ireland over which it is possible to run the race for the Gordon Bennett Cup, and that the preliminary arrangements were initiated by him. At the meeting above referred to I announced that the Club would head the list by a subscription of 100 guineas out of its funds, and a list of other subscriptions will be found appended. I should be glad if you could see your way to receive subscriptions to the Testimonial Fund and to open your columns for publication of the amounts already subscribed.—Yours faithfully,

R. W. WALLACE, Chairman, A.C.G.B.I.

[Included with the foregoing letter was a list of subscriptions amounting to £347 14s.—Ed. M.C.J.]

FRICITION TRANSMISSION GEAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was much interested at the recent exhibition at the Agricultural Hall in a car in which the power was transmitted and the speed varied by means of friction discs, but am somewhat doubtful as to the efficiency of the same in practice. Much time and money have been spent by inventors in the effort to devise a practical variable speed friction transmission for motor-vehicles. Friction discs of various kinds have been tried with faces composed of compressed paper, wood, leather and other materials tending to increase the friction, but no device of this kind has

long remained in practical use. The size of the frictional surfaces required to transmit power sufficient to drive a car is generally so great that they become inadmissible on account of the room they take up. Le Pape, the French inventor whose carriage was described in one of the early issues of the *Journal*, practically exhausted the subject of friction discs, and was compelled to abandon them entirely for the reason above stated. He found it necessary to increase the dimensions of his surfaces time and again, until he was compelled to admit the case was hopeless. I believe, too, that a well-known London motor agent wasted a good deal of money on a friction transmission. If any reader has had experience of a friction-driven car, I feel sure a recital of the same would be of interest.

Yours truly,
BALLADEUR.

MOTOR-CAR SCHOOLS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to your correspondent "Would-be Motorist," I should like to say that he should have no difficulty in learning to drive, as most firms would be pleased to supply a driver to instruct him. I am employed by one of the leading firms in England, and have just returned from a customer who purchased one of our cars, and after one week's tuition he is able to drive very well.—Yours truly,

PETROL.

LUBRICATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to my article on "Lubrication" in the *Journal* of the 25th ult., Mr. Shackleton, in a letter in the last issue, objects to my advocacy of the introduction of petrol in an emergency into motor cylinders as a cleaning agent, and somewhat dogmatically recommends paraffin oil for this purpose.

The disadvantages of a temporarily deteriorated cylinder surface which your correspondent urges against the use of petrol is, I think, far outweighed by the following considerations:—

1. Possible difficulty in "starting up" engine after using paraffin in sufficient quantity to clean out all oil.
2. Deposit on valves and plug characteristic of paraffin after engine has been running a short time.
3. Visible and objectionable exhaust obtained with paraffin.
4. Superior cleanliness of petrol.

—Yours truly,

THE WRITER OF THE ARTICLE.

IDENTIFICATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I observe with much regret that it is becoming common to speak of "numbering proposals," "identification numbers," "numbering legislation," etc. Thus those who are in favour of means of identification are held up to scorn as being in favour of motor-cars being placed on a par with "street cabs and omnibuses." Now, Sir, I am strongly in favour of means of identification, and am equally strongly opposed to any legislation which will compel the motorist to place large figures on his car. If this is what is proposed I shall unhesitatingly vote against it.

While I hold that the misconduct of many persons driving motor-cars justifies the demand for means of identification, if the speed limit is removed, I think that the use of a name selected by the owner is the proper mode of providing for identification, although it may be convenient to have a number opposite the name in the register and in the licence issued.

Therefore I would earnestly beg of writers in or to the Press to abandon the word "numbers" in referring to the matter, and to speak of "means of identification" only. If the words "numbers" and "numbering" are constantly flourished before legislators and members of the public it will come to be assumed that this is what those who favour means of identification are willing to submit to, which is certainly not the case.—Yours truly,

J. H. A. MACDONALD.

THE ELIMINATING CONTEST.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Has it occurred to any practical motorist that the Eliminating Test in connection with the Gordon Bennett race was obviously inadequate? This is rightly pointed out in the *Daily Telegraph*, and when we consider that the course will be more than 350 miles in extent, it does seem absurd to select the team on a kilometre track, where the impossibility of cars getting to their best speed is apparent to the veriest tyro.

Suppose an Eliminating Test had been required in connection with the Brighton walk. Would the competitors have been content with a fifty yards sprint? No! I should have preferred to have seen the Clipstone course passed by, and a run of fifty miles taken either in Ireland or in the early daylight on some quiet country roads in this country. There are many estates where a circular course could have been obtained.

I hear that a protest has already followed the Eliminating Test, and that the Star Company are not quite satisfied with the way in which the decision was arrived at. Their reasons should be seriously regarded by the Club Committee.

By the way, how does the matter stand between the Napier and Wolseley

companies? Will the latter accept the offer made on behalf of the former cars, and is there likely to be a further match—this time between these two—for the honour of the third place? Or is the report as to the inclusion of the third Napier in the team quite official?—Yours truly,

A MOTOR SPORTSMAN.

THE LIGHT LOCOMOTIVES ACT, 1896.

AT Runcorn, Messrs. Thomas Rigby and Sons, corn millers, Frodsham Bridge, have been summoned that they, being owners of a locomotive, unlawfully failed to employ a sufficient number of men to work the same. Police-sergeant Bennett said the engine, weighing 2 tons 18 cwt., with a wagon attached, passed through Sutton with only one man in charge. Smoke and steam were emitted. Mr. Fletcher, of Northwich, defended. The engine had been specially constructed by Messrs. Tasker and Co., of Andover, to satisfy the requirements of the Light Locomotives Act, 1896. He called Mr. G. Hoare, managing director to Messrs. Tasker, who gave evidence to this effect, and said the engine was fitted with smoke-consuming appliances and brakes. Similar engines went to Covent Garden, London, every day, and there had never been a complaint. One man in charge was sufficient. The Bench decided that the engine was a light locomotive, and dismissed the case.

ALLEGED BREACH OF CONTRACT.

MR. JUSTICE KENNEDY has delivered judgment in the King's Bench Division of the High Court in the case of *Roots and Venables v. Alday and Onions*, of the Matchless Works, Birmingham. He said this was an action by the plaintiffs, who were engineers and motor-car makers of London, to recover damages from the defendants for breach of contract in connection with the delay in delivering six sets of motor-car engines. He should assume that if the engines had been delivered as expected the plaintiffs would have made a profit of £50 for each car, and therefore he would give plaintiffs £250 damages for the delay in the five engines and the return of the £100 paid as deposit. As to the counter claim, in his opinion there was no delay caused by any act of the plaintiffs, and therefore judgment would be for the plaintiffs on both the claim and the counter claim. He understood an arrangement had been made by which the five mechanisms in question would be completed by the defendants and delivered to the plaintiffs within two months, the plaintiffs to pay half the contract price for them. Judgment would therefore be for the plaintiffs for £350 with costs, except in regard to the first claim made by the plaintiffs, and in regard to the special damages which plaintiffs had claimed. Judgment accordingly.

TRAILER CASES.

AT Chertsey, Mr. S. G. Townsend, of Pinner, was fined £1 and costs for driving a motor with a trailer more than six miles an hour. Defendant said if the law required the pace to be not more than six miles an hour he would plead guilty. But the law was never intended for motor-bicycles with trailers. The Chairman: Whether the law is right or wrong we have to administer it. The fine was £1 and costs. The same penalty was inflicted in the case of Mr. S. P. Harrington, of Surbiton, for a like offence.

AT Wokingham, Harold Matthews, Great Marlow, was summoned for riding a motor-bicycle, with trailer attached, in the London Road, at a greater speed than six miles an hour, contrary to Rule 2 of Article IV. of the Light Locomotives on Highways Order, 1896. Defendant pleaded that he was a novice at driving a motor-bicycle, and was not acquainted with the law. Police-Sergeant Jannaway said defendant was driving at the rate of fifteen miles an hour.—The Bench did not think the defendant offended wilfully, and dismissed the case.

CLAIMS FOR DAMAGES.

JUDGE RUSSELL, at Croydon, has ordered Mr. S. F. Edge to pay £11 damages for colliding on January 24th with a van owned by Mr. G. Shepcott, of Croydon.

CAPTAIN DONALD NICOLL, D.S.O., brought an action against the Hon. Robert Beresford for personal injuries sustained through a collision between plaintiff's motor-bicycle and defendant's motor-car in Euston Road. The case for the plaintiff was that the car was driven at a furious pace on the wrong side. Plaintiff was knocked down, several teeth were broken and others knocked out. His dentist's bill amounted to 76 guineas. The defence was that the *chauffeur* was not on his employer's business, and that, in those circumstances, the employee was responsible. The jury awarded the plaintiff £150 damages.

At the Carmarthen County Court, a case has been heard in which Mr. J. N. Williams claimed £10 from Dr. R. D. Evans for damage caused to a horse and trap through the negligent driving of a motor-car by defendant's servant. Judge Bishop, in giving his verdict, held that from a legal point of view both motor-car and horse and trap were legally entitled to use the highway, if they used it with due caution. It was for him to be satisfied that defendant was exceeding the legal limit of speed, and therefore guilty of negligence, for which he would be responsible. He failed to be satisfied from the plaintiff's case that such legal limit of speed had been exceeded in this instance, and therefore found a verdict for the defendant, with costs. Judgment accordingly.

At the Burton County Court, Judge Smyly, K.C., was engaged for several hours in the case of William Deakin v. the Wolseley Tool and Motor Car Company, Adderley Park, Birmingham. Mr. Parfitt was for the plaintiff, and Mr. Vachell for the defendants. Plaintiff, a market gardener, of Lichfield, sued for £50, as compensation for injuries sustained through the alleged negligent driving of defendants' servants. The action arose out of an incident which occurred early on the morning of August 21st between Lichfield and Burton, during a speed trial, when the company's cars startled the plaintiff's horse and caused it to bolt, throwing the driver to the ground, and resulting in injury to both man and beast. The drivers of the motor-cars were summoned before the Burton Bench on that occasion, and substantially fined. The defence was that the accident was caused by the negligence and carelessness of plaintiff's own driver, but his Honour held that it was brought about by the unreasonable speed of the motor-cars, and gave judgment for the plaintiff for £30, costs to follow the event.

on a gate disguised as yokels. As soon as a motorist sweeps past, one of them moves a signal whilst another in hiding takes the time with a stop watch over a measured distance. Round a bend in the road is an uniformed officer waiting to pull up the victims.

SEVERAL motorists have again fallen into the Ripley trap, where Sergeant Jarrett is one of the best known M.C.'s. The actual measured distance is 176 yards, and is located in the parish of Send.

A QUARTER of a mile has been measured on the London Road, South-borough, and several traps are reported from the Tonbridge district.

MOTOR-CAR v. DOG.

At the Bridgend County Court, before Judge Williams, Frederick Harries, motor-car driver, Pwllandras, near Bridgend, was sued by Thomas

View of Smiths' Shops in the Works of Stirling's Motor Carriages, Ltd. (See page 201.)

POLICE TRAPS.

IN the centre of the winding village of Long Preston, near Settle, Yorks, a measured 220 yards is being watched, and many motorists have fallen victims during several weeks past.

AN elaborate trap for motorists is in constant operation in the Headingley Lane, Leeds.

WHITE HILL, running into Henley-on-Thames, on the London road, has been a centre of watchfulness on the part of the police.

AMONG new traps on the Bath road is one on the London side of Twyford.

THE traps on the North road, in the county of Huntingdon, include one near the village of Paxton.

A MEASURED distance on the Bath road, just after the thirtieth milestone from town, has been used for trapping motorists.

ON the London road, near Hare Hatch House, Wargrave, the Berkshire police have been very active. Armed with stop watches, they watch the journeying of motorists over a measured quarter of a mile. This trap is reported to be of an elaborate nature. Policemen are said to be stationed

Trevelyan, of the same place, for £10 for the loss of a fox terrier, killed by defendant's motor-car, on the 27th September. The evidence of plaintiff's witnesses was that the dog was in the road, about three yards from the kerb and near plaintiff's cart, when the motor-car, driven by defendant, came along at a rate of from fifteen to twenty miles an hour, ran over the dog and killed it. Defendant said he was driving at a rate of not more than six miles an hour. The dog was under the cart, but as the car came along it dashed out right under the wheels and it would have been impossible for him to avoid it. Judgment for £5.

REFUSING TO STOP.

At Willesden, Angelo Caprino, Hartland Road, Kilburn, has been summoned for driving a motor-car at an excessive speed and for refusing to stop when requested by the police. He was fined £2, with costs, on the first charge, and £3, with costs, on the second.

Where no alleged speed is given it is understood to be above the legal limit.

* Motor-Cycle Cases.

MR. JOHN JONES HUGHES, of Sketty Isaf, near Swansea, was summoned for furiously driving a motor-bicycle at the rate of 18 miles per hour down Aberdulais Hill. A reporter, in setting forth the terms of the summons, says he was charged with "furiously driving a motor-bicycle to which was attached a chair, in which a lady was seated."

EMILE SOLAND, whose case was remanded at the Marlborough Street Police Court, was charged with driving furiously, and thereby injuring a man, who had to be taken to the hospital in consequence.

THE 100 MILES NON-STOP TRIAL.

THE Weston Motor Syndicate has addressed the following letter to the Club re the trial to which reference is made elsewhere:—We notice in the official report on the performance of our 10-h.p. Chenard and Walcker car, the following statements: On the one hand, under the heading "Speed," the words "up to legal limit" appear, whilst in the Official Observer's footnote the remark appears, "The car was driven very slowly, the engine being throttled the whole time," etc.

Seeing that in the regulations governing the 100 Miles Trial the following appears:—"Speed.—No speed in excess of 12 miles an hour will be recognised excepting in ascending Dashwood and Aston Hills," etc., and that since our car left the Automobile Club's premises in Piccadilly at 8.55 a.m., returning, after completing the 100 miles, to the starting point at 5 p.m., according to our representative's report, we submit that we conformed to the Club's regulations, and maintained a speed as near as possible equivalent to the legal limit. Either, therefore, the above rules mean nothing, notwithstanding their stringent wording, or other cars which have followed the latter course have been given an advantage over us, who saw fit to abide by them. Believing that the quarterly 100 miles trial was a consumption trial rather than a test of speed, we endeavoured by every legitimate means in our power to establish a record, and under these circumstances, therefore, we did not wish to exceed the legal limit. We request, therefore, that, considering the above circumstances, the Official Observer's footnote that the car was driven slowly, etc., should, in justice to ourselves, be omitted from the Club's certificate; as long as the car was driven up to the legal limit, it could not be termed "slowly" if the Club's rules are intended to be observed. We were entitled to take advantage of every bit of down grade where gravity would help us, which, by the way, never compensates by 30 per cent. of the additional fuel required for ascending up-grades. Notwithstanding this, however, we challenge any manufacturer to transport four passengers, in a car weighing complete over one ton, a distance of 59½ miles on one gallon of petrol, as we did on the 24th of April, whether he take advantage of every bit of gradient or not.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, MAY 16, 1903.

[No. 219.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

AT length the official voting paper in connection with the postal vote of the A.C.G.B.I. has been sent to members, who have been confused by the presentation of a triple inquiry where a simple question should have sufficed. Members are asked if they favour numbering, provided (1) the speed limit is abolished; (2) the legal ruling that a high rate of speed is to the common danger is altered and (3) the tare limit is raised. It is, however, generally felt that identification—whether by numbers or names—may be entertained by the Legislature without regard to any of the wished-for concessions; hence the proposal seems to place suggestions before the authorities who may decline to give motorists anything in return. Earl Russell asks for a vote on the small identification plate, the certification of drivers, and the increase of the penalty for serious offences. In view of the uncertainty caused by the first question and the want of necessity for the third we feel that an affirmative reply to the second will be most in consonance with the feelings of motorists on the subject, and hence we welcome this question, "Are you in favour of nothing further being done by the Club at present to promote legislation?" with a definite and emphatic "Yes."

"Yes"
to
No. 2.

The absurdity of the whole matter is made plain to the man in the street, and should be equally translucent to the man in the car, by the fact that Mr. Walter Long is premeditating action. What need for the Club to waste time and arouse friction by the promotion of legislation? The only wise policy is to await the introduction of the Government measure, and then seek to amend or adopt it. But to still further confuse the issue by the promotion of a fresh Bill seems almost as unwise as the course of procedure which has been adopted from the beginning of the agitation.

Electrical
v.
Petrol Cars.

We understand that makers of electrical vehicles are showing considerable opposition to the numbering proposals. They protest against the suggestion that "conspicuous marks of identification" should be placed on such carriages, and declare that to insist on "disfiguring numbers" being placed on vehicles would practically put an end to their use in London. What applies to electrical vehicles must also be urged in regard to petrol cars. There must be no differential treatment, and the makers of electrical vehicles will be well advised not to ask for eliminating clauses in regard to their special cars, but to reject the proposal to number any class of vehicle whatsoever. We are glad to hear that they agree as to the folly of numbering, and doubtless they will join with others in writing "Yes" opposite the second question of the Club.

A Run
to Watford.

RECENTLY we took a spin to Watford on a 12-h.p. Benz-Parsifal car—the new type described in our report of the Agricultural Hall Show, and illustrated in our issue of April 25th. Speeding away from the Tottenham Court Road, opportunities of seeing the easy control exercised by the driver were frequent, and then by Regent's Park and St. John's Wood we quickly got into Cricklewood, and over as bumpy a bit of road as any stage coach had ever to encounter. Verily the local authorities should be awakened to the fact that they should be as careful of the requirements of road users as of pedestrians. From the newer suburbs we quietly ran into the famous village of Edgware, whose broad wide street knew something of the glories of the coaching days of old—now apparently being revived by the automobile.

Road Obstructions.

THE Benz-Parsifal has the virtue of being particularly free from vibration, while its comfortable tonneau is well suited to a touring vehicle—and such this car is intended to be. Its speed we tested across Bushey Heath, and as no policemen were about and the road was clear our driver took advantage of the rare occasion and "let her go" up to a speed of—well, 'tis no matter. We did it; and the car was slowed down in good style. But why are great wagons drawn across the road to the possible danger of all who attempt to pass. Twice we nearly collided with vehicles that were placed sideways across the street, while the drivers were nowhere near the horses. Only the presence of powerful brakes on a car of easy control, and a wideawake driver can avert catastrophes in such circumstances. How we returned will be told next week.

The Supply of
Petrol in Ireland.

COMPLAINT reaches us of the difficulty experienced by several Irish firms to obtain supplies of petrol and motor spirit, and we would urge those responsible to see to the matter without delay. A dearth in Ireland next month would thwart many of the anticipations of prosperity that have been indulged in. In view of the international interest in the event in the Emerald Isle the matter assumes supreme importance; and we would advise local firms to prepare for the coming demand by giving orders well in advance. At the same time we would point out that those in the trade are not wholly to blame, for the railway and shipping companies do not appear to have shown much enterprise in dealing with the circumstances that have lately arisen.

The
Westminster
Lectures.

MODERN innovations are being dealt with by able authorities in a series of Friday afternoon lectures at Caxton Hall, Westminster, the telephone, the traffic problem and the automobile, all being brought to the rays of publicity. Last week Mr. Mervyn O'Gorman was the speaker, and although his

lecture was a complete vindication of the potentialities of the motor-car, it did not strike us as being so successful as was his luminous and bright address on the motor-bicycle at the Automobile Club some weeks ago. There was scarcely that sympathy between the lecture and the animatograph that is essential in a popular lecture, but probably this was the weakness associated with a "first night." More frequent rehearsal will make the lecture—accompanied with some splendid moving pictures—one of the attractive items in the winter syllabus of the Lecture Agency, by whom this course is being organised.

Proposed Trials for Electrical Vehicles.

At the last meeting of the Advisory Committee on Electrical Vehicles of the A.C.G.B.I., it was decided that, in consequence of the pressure of business on the Club officials during the current year in connection with the Gordon Bennett Cup Race, and other contests, trials of electrical carriages shall be held in May, 1904, and that the Executive Committee be requested to reserve that month for the same. No definite programme has as yet been prepared, but the following

Mr. J. B. Joel on his 20-h.p. M.M.C. Car.

recommendations with regard to the main lines of the trials have been arrived at:—There shall be only one class of vehicle, which shall be run over a town route, with an optional long-distance run to test the capacity of the car on a single charge. There are also to be hill-climbing trials, in which speed will be a main factor; an average speed shall be fixed, based upon *the legal limit*. Marks will be deducted for speeds below the normal. Marks will be deducted for all stops other than compulsory ones, and marks will be deducted for every mile of the course which may be unfinished at the end of the day. Routes will be selected for six days for all the cars, and, after examination of the vehicles by the judges, a seventh optional long-distance route shall be selected, for which no marks shall be given, but the cars shall be under observation with a view to issuing a special extra certificate noting the distance, repairs, etc. In order to meet the views of those who wished to have trials extending over a long distance each day, a sub-committee was appointed to consider the question of arranging for quarterly trials for electrical vehicles, on the same lines as those for petrol vehicles, the distance to be from 50 to 100 miles.

British Cars in France.

THE Automobile Club has issued a circular with regard to the position of automobilists wishing to tour in France with their vehicles. Tourists wishing to enter France with a car not of French make (or of French make for which they cannot procure the necessary papers to prove French origin) have to deposit with the Customs authorities an amount equal to 50 francs per 100 kilos for cars weighing over 125 kilos. This matter can be arranged with the A.C.G.B.I. before leaving England. With regard to driving certificates, those issued by the British Club are accepted by the French authorities. An important agreement has now been come to by which "declarations" from British automobile builders will be accepted with the view of granting the "permit of free circulation" on the French roads. Makers in this country should take advantage of this arrangement and send their cars to Arras, near Boulogne, to be examined as types in order to obtain the approval of the French Service des Mines, and thus assist their customers. Full particulars as to the procedure to be adopted in connection with this matter will be supplied by Mr. J. W. Orde, the Administrative Secretary of the Club.

Motor-Car Imports and Exports.

THE returns relating to the British imports and exports of motor-cars and cycles during April are now available. To deal first with the imports, a new record has been established, no less than 588 cars and cycles having been imported into this country last month, the value of the same being returned at £138,566. The value of the "parts thereof" is given as £15,389, so that we get a combined total of £153,955, as compared with £206,296 in March last, and £121,180 (representing 434 cars) in April, 1902. Some of the imports were only of a temporary character, being reshipped to foreign destinations. Thus last month the reshipments comprised twenty-nine vehicles, amounting in value to £7,159, and £1,123 of parts, bringing down the net imports in April to £145,673, as against only £116,420 in the same month a year ago. For the first four months of the year the net imports of motor-cars, cycles, and parts stand at no less than £593,639, or more than double those during the same period of 1902. As regards the exports of automobiles of home manufacture, the

shipments during the past month amounted to 50 vehicles of a value of £21,830. Of parts the exports attained a value of £3,672, making a combined total for April of £25,502, as compared with £19,102 in March last, and £12,102 (representing twenty-nine vehicles) in April, 1902.

Deposits.

THE question of paying deposits when giving orders for automobiles is one that requires serious consideration from intending purchasers. Of course, when a firm is expected to make a car it is only right that it should have some guarantee that delivery will be accepted and the remainder of the purchase money forthcoming; but on the other hand the customer needs protection as well. Hence he would do well to withhold deposits unless substantial security is given. In many cases old and established reputations are probably sufficient, but there is a general feeling growing up that the guarantee of deposits is necessary in all business transactions.

The Fischer Omnibus.

ON Wednesday of last week the Syndicate controlling the Fischer motor-omnibus invited a full complement of passengers to take part in a trial run to Richmond. The route taken on the outward journey was via Oxford Street, Shepherd's Bush, Brentford, Twickenham, and Teddington, the return to town being through Richmond Park and over Hammersmith Bridge. The vehicle, although not fast, travelled the whole journey without a hitch, taking the steep gradients by Richmond Bridge and up the hill most comfortably—being stopped on the latter, and restarting with ease. The principle of the system consists in a combined petrol engine and dynamo—with one motor for each rear wheel and storage battery and controller—the running being most silent and steady. A company is being formed to introduce the 'bus, of which we understand Mr. S. F. Edge is the chairman.

An East Anglian Service.

UNDER the title of the East Anglia Motor Carriers, Ltd., a company is in course of formation which promises to do much for the eastern counties. The headquarters of the venture will be at Ipswich, with depots in London, Bury St. Edmunds, Chelmsford, Norwich, and Peterborough, and encouraging promises of support have been received from some of the largest manufacturers and traders along the routes proposed to be worked. It is intended eventually to run about thirty cars, of which a dozen will be heavy vehicles with a capacity of six tons per car and trailer, and sixteen smaller cars, carrying 1½ tons per car. Two large cars will run between London and Ipswich, a distance of 70 miles, touching at Chelmsford and other places en route; two smaller cars will run from London through Chelmsford to Bury St. Edmunds, a distance of forty-two miles; two cars will run from Bury St. Edmunds to London via Chelmsford, and two from Ipswich, also via Chelmsford. Two cars will run from Ipswich to Norwich, and from Norwich to Ipswich. Four cars will ply between Bury, King's Lynn, and Peterborough, a distance of fifty-five miles. The sixteen smaller cars will be employed in collecting and delivering goods in London, Chelmsford, Ipswich, Norwich, Peterborough, and Bury St. Edmunds. The district is a particularly suitable one for the enterprise, to which all motorists must wish well.

Brakes and Side Slips.

IN another column we give particulars of an accident which happened to Lord Alan Percy at the foot of Kingston Hill. The facts are correct as stated. The back of the car swung round, a wheel striking the kerbstone and breaking, while the passengers, except the driver, were flung out, one going through the window of a draper's shop. The body of the vehicle was wrenched right off, one passenger retaining his position in the seat, and skidding along the ground for some little distance. The body was broken into numerous pieces,

the two back seats being separated, the door also becoming a separate entity. One spring fastening was broken, and all wheels had spokes smashed, but the frame of the vehicle was substantially unhurt, the bonnet and front seats being absolutely uninjured. The spectacle of the wrecked car was altogether unique.

London Police Activity.

METROPOLITAN policemen stationed along the main roads leading out of London were particularly vigilant on Sunday as to the speed of motor-cars. Stretches of road were measured off, and automobiles seen advancing were timed by plain clothes officers, who did not hesitate to stop all cars travelling at what they regarded as beyond the legal speed and to take the names and addresses of the drivers. The police achieved most success, from their point of view, on the High-road, Kensington. The quarter of a mile between the Albert Hall and the De Vere Hotel was kept under observation by several plain clothes men, whose attention was divided between motor-cars and stop watches. Between nine and ten o'clock they found it necessary to interrupt the progress of about fifteen cars and obtain the information which usually precedes a summons. The "bag" would have been larger, perhaps, but for a warning which was issued very early in the morning by the Automobile Club. Members of that organisation were not surprised, therefore, when they reached the Albert Hall, and did not allow their cars to go at full speed over that particular piece of road, but drove with particular care.

Whitechapel Road, London, in 1830.
(Caricature by Aiken, published in "Modern Philosophy," in 1828.)

The Earl of Wemyss on Legislation.

WHILE automobilists generally are awaiting with interest the production by the President of the Local Government Board of his promised Bill affecting them, the Earl of Wemyss has raised, in the House of Lords, the question of their grievances. He has intimated to the Secretary for Scotland his interest in the revision of the regulations now in force in that country with reference to motor-car traffic, and suggests bringing these more in accord with the policy suggested in the resolution submitted to him in November, 1899, by the County Council of Haddington. This declared "that it is inconsistent with sound and enlightened policy in the matter of motor-car traffic to lay down any hard-and-fast rule as to speed, it being ordered and understood that when driving through towns, villages, turning corners, or passing branch roads motor-car drivers shall not exceed the ordinary speed in like circumstances of horse conveyances, and that they shall, further, when passing or meeting any horse-drawn vehicle, slow down, and, if needs be, stop, so as not to frighten the horse or horses drawing the said conveyance; but that, subject to these conditions, a motor driver shall be left free to exercise his own discretion as to speed when the road is clear, on the understanding that the driving be not reckless. For the purpose of identification, a large number shall be attached to the motor, before and behind, and illuminated at night."

On the Road.

BARON BARRETO's letter in our correspondence columns draws attention to the bad manners of many drivers of horses who have too long been accustomed to regard the public roads of the country as a monopoly of their own. In the particular case cited such gross conduct deserves not only censure but punishment, and by giving publicity to matters of this kind Baron Barreto is rendering good service to the Norfolk motorists, of whose Club he is a distinguished leader.

The Gordon Bennett Race.

A MEETING of the Races Committee of the A.C.G.B.I. has been held to consider the protest of the Star Company, with regard to the Eliminating Race, but it was decided that the company had no cause of complaint. The members of the Committee present were Mr. Mark Mayhew (in the chair), Messrs. Alfred F. Bird, S. F. Edge, Staplee Firth, Roger H. Fuller, E. H. Cozens Hardy, J. E. Hutton, C. Johnson, Major Lindsay Lloyd, Captain Bowman Manifold, Messrs. Mervyn O'Gorman, R. E. Phillips; the Hon. C. S. Rolls, and Mr. R. W. Wallace, K.C., with the club secretary in attendance. Mr. Mark Mayhew, L.C.C., will act as pilot in the Gordon Bennett race.

The Specific Gravity of Petrol.

UP to the present Messrs. Carless, Capel and Leonard have maintained the standard quality of their petrol, and all they have sent out has had a specific gravity of .680 to .685 at 60° Fahrenheit. Now, however, the standard quality of their petrol will have a specific gravity of .695 to .700 at 60° Fahrenheit. The change in specific gravity does not represent a change in the quality or efficiency of the spirit, but is due to the firm being compelled to manufacture petrol from a different kind of petroleum. This is owing to a great increase having taken place in the demand for the crude naphtha from which the petrol has hitherto been manufactured, and also to a decrease in its production. The new petrol, sp. gr. .695 to .700, corresponds in its boiling points and other physical characteristics with the old petrol of .680 to .685 sp. gr. The difference in specific gravity is not due to a difference in the volatility of the spirit or in its purity, but to slight differences in its composition. It is said to be as easy to get perfect combustion and maximum efficiency with the new standard petrol as with the old. Messrs. Carless, Capel and Leonard could manufacture petrol of .680 to .685 specific gravity from this new kind of petroleum, but the quality of the product obtained would not correspond nearly so closely with the old standard of .680 to .685 specific gravity as does the new standard, and the price would be considerably higher.

Glasgow to Leeds.

THE first stage of the non-stop run from Glasgow to London, promoted by the Western section of the Scottish Automobile Club, was covered on Wednesday. Out of the twenty-five cars entered, all but three appeared at the starting point, and seven of the nine motor-cycles. The cars which started were:—14-h.p. Chenard-Walcker; 12-h.p. Gladiator; 24-h.p. De Dietrich; two 10-h.p. Lanchesters; two 10-h.p. Wolseleys; two 12-h.p. Sunbeams; 10-h.p. Argyll; 12-h.p. Gardner-Serpollet; 14-h.p. Brooke; 9-h.p. Argyll; 24-h.p. Rochet Schneider; 12-h.p. Georges Richard; 24-h.p. Georges Richard; two 12-h.p. Arrol-Johnstons; 10-h.p. De Dion-Bouton; 12-h.p. Argyll; 6½-h.p. Peugeot; and 24-h.p. F.A.C. The motor-bicycles were two 2½-h.p. Triumphs; 2½-h.p. Quadrant; 2-h.p. Ariel; 2½-h.p. Brown; and two 2½-h.p. Humbers. At Leeds, a great throng of spectators awaited the motorists. The Humber motor-bicycle and the 24-h.p. De Dietrich were the first to put in an appearance, but speed counts for nothing in this trial. All the cars, however, arrived at Leeds, having covered the longest stretch of the journey within the maximum time appointed of 18h. 10min.

Incidents on the Way.

THOUGH he managed to finish the journey, the driver of the Brooke car had a mishap. One motorist found himself storm-bound at Kendal, and went into Leeds by train. Mr. D. Edwards, the driver of a 24-h.p. Georges-Richard car, was the victim of a singular mistake. When near Leeds he found it necessary to turn on a fresh supply of petrol. This, as he supposed, was done; but presently the engine stopped and refused to move. An examination revealed the mystery, and it was found that the cask had contained not petrol, but water. Fortunately a friendly passer-by threw him in a tin of the much-coveted liquid, and once again he was able to pursue his journey, after much valuable time had been lost. One or two drivers lost their way, among them being Mr. J. W. Stocks, who was in the front rank up to Skipton, but who there took a wrong turning, and did not find out his mistake until he was a mile beyond Keighley. The detour cost him something like forty minutes. At Hellfield the police laid a trap, and took the names of five competitors. On arrival at the premises of Mr. Rowland Winn and Messrs. A. Dougill and Company (Limited) in Leeds, the cars were handed over to officials, whose duty it was to see that nothing was repaired, lubricated, or adjusted. On Thursday the start for London was made at 6.30 p.m., and next week we shall publish further particulars of the run.

TO-DAY (Saturday) the Norfolk Automobile Club will visit Bury St. Edmunds and District.

FORTY-FIVE touring cars started from Paris on Wednesday in connection with the Paris-Madrid motor-car race.

THE rights for France and her Colonies in the Parsons Non-Skid have been taken over by the Société Française de l'Antiderapant Parsons, of 9, Rue de Rocroy, Paris.

PRESSURE on our space this week prevents us dealing with the new regulations with regard to the storage of petroleum spirit, just issued by the Home Secretary. We shall, however, give them in our next issue.

THE National Circuit of Belgium, organised by the A.C.B., started on Saturday, forty motor-cars and cycles leaving Brussels for Antwerp. On Sunday the journey was continued to Liege, on Monday to Arlon, and on Tuesday to Namur.

IN the Tottenham Court Road, London, W.C., some large shops and warehouses are being erected with over a hundred feet depth and exits into Alfred Place. One of these has been taken by a motor-car firm for the sale of light and heavy vehicles.

MANY of the daily press have been drawing attention lately to the fact that a large art warehouse in Shaftesbury Avenue, W.C., had been taken for the purposes of a motor depot. This we can confirm, and believe that the chief cars on sale will be Panhards and Mercedes.

CAPTAIN DEASY left the Automobile Club in Piccadilly, W., a few minutes after midnight on Saturday on a 24-h.p. Rochet-Schneider car for a non-stop run to Glasgow. He reached York at 9 a.m. on Sunday morning, Edinburgh at 7.50 p.m., and Glasgow at 9.30 p.m., the non-stop run of 427 miles having occupied 21 hours 20 minutes.

THERE can be no doubt that the manufacture of motor-cars in England will quickly and largely increase, and Sheffield would seem to be particularly well suited for the establishment of manufactories, being the centre of the steel industry. There is a large quantity of available labour, and suitable premises are to be found near the Midland Railway station.

SIR JOHN HIBBERT, who presided at the annual meeting of the County Councils Association on Wednesday, described the President of the Local Government Board as having been "very laggard" with respect to the motor-car question. He was glad to see that a Bill was at last being drawn up to deal with it. The present speed limit was ridiculous, as it was too low for light cars and too high for heavy vehicles.

THE IRISH FORTNIGHT.

WE hear that the English representatives, Messrs. S. F. Edge, Charles Jarrott, and J. W. Stocks, will be quartered near Athy, the first named having taken Castle Rheban House, Athy, from June 7th.

COMPETITORS from Europe and America will have to remember the rule of the road when struggling for supremacy in the forthcoming race. Here we keep to the left and pass on the right; but in France and Germany drivers are accustomed to the right-hand side—a fact which is one of the most difficult thing; English competitors in Continental contests have to remember. As the American experts who will race have had experience on a race track, where the British rule of the left of the road prevails, there will be, fortunately, less difficulty in overcoming the awkwardness which necessarily follows such an alteration from fixed methods; but outside a race track they have been accustomed to the American rule of driving to the right, and it is precisely in this particular that they, in common with the German and French teams, will have to be exceedingly careful.

IN connection with the events of the tour some interesting offers of help have been received. Captain Dyke Acland will act as interpreter in French and German; Sir Coleridge Kennard, Bart., has volunteered as a motor-cycle steward; Mr. R. A. Lucy, F.R.C.S., will be available in case of accidents or emergencies; Mr. W. H. Clay will be a road steward on a 10-h.p. Ryknield car; and among public men who will serve in an official capacity are, Earl Russell, Captain Arthur Hill, M.P., Mr. J. Gretton, M.P., and Mr. W. Carlisle, M.P. Col. Magrath, who was a popular participant in the historic 1,000 miles trial in Great Britain, will also act as a steward on the Athy-Kilcullen section of the Gordon Bennett Cup course.

THE suggestion made last week in the *Journal* with reference to the laying of dust by means of salt water has aroused considerable attention both in Ireland and among borough and county surveyors in England. Mr. G. Ball, the Borough Surveyor of Bexhill, is of the opinion that salt water for street watering purposes is a great advantage over ordinary fresh water, inasmuch as the roads keep moist much longer, and therefore less watering is required.

MR. C. P. REDMOND has written "Beauty Spots in the South East of Ireland," and his pen, with the aid of some capital photographs, has resulted in a very readable volume published by Messrs. C. P. Redmond and Company, at Waterford—where motorists will be well received this year, for is not Mr. W. G. D. Goff, J.P., a resident in the locality? The routes are well planned and much information is given with regard to hotels, etc., which we hope will be as accurate during the Irish Fortnight as it undoubtedly is in an ordinary season. Being designed for those who go by road, the Guide will be far more useful to motorists than many of the books to which they will be introduced in the Emerald Isle.

THAT the Gordon Bennett race will prove of permanent benefit to the country we have never doubted, and proof comes in a discussion at a special meeting of the Carlow County Council. It was decided to authorise the County Surveyor, Mr. Qulton, C.E., to expend such sum of money on the roads in the county as might be granted by the Automobile Club, subject to any order made by the Irish Local Government Board. Mr. Engledow thought as the Club were prepared to spend so much money on the roads it was a great chance for the Council to grant a similar amount and make a thorough work of it by steam rolling and improving the roads generally. It would be an experiment as to how steam rolling the public roads would work in the county. They had now the chance of getting half the amount necessary, and he thought it would be a very good thing

for the Council to add £150 and make a good road which would last for five or six years. In this way they would have four or five miles of road permanently improved. The County Surveyor pointed out that if they set a good example it was very probable that the Kildare County Council would follow in the same line, and ultimately it was unanimously resolved to hire a steam roller for use on that portion of the county roads over which the Gordon Bennett Cup Race will be held, the cost of the same not to exceed £125 (provided the Automobile Club make an equivalent grant towards the improvement of the roads), subject to the sanction of the Local Government Board.

AFTER leaving Killarney many participants in the great tour will visit Tralee, twenty-two miles away, and at the base of the Bantreggan Mountains. It is the largest town in the county of Kerry, and as a result of the popularity of the district as a touring ground, Messrs. Thomas Galvin and Sons, who are leading local merchants, keep a stock of motor spirit.

An Interesting Reminiscence.—Messrs. Jarrott & Edge on the Panhard Racer of 1899.

THE Department of Agriculture and Technical Instruction in Ireland have been examining the prospects of motor-car services in the country, and their expert has visited Mayo and Sligo, specially going over the Ballina and Belmullet routes. The Department regards the scheme as one which they would be justified in considering favourably, provided a portion of the capital necessary (say one-fifth, or £1,000) were invested in the undertaking by the locality. The estimate of the expert goes to show that a Ballina-Belmullet scheme, properly worked, should cover expenses and depreciation, and result in a reduction of thirty per cent. to forty per cent. on present carriage rates, and a still higher reduction on passenger fares. The Department would thus be in a position either to consider favourably themselves the idea of supporting a scheme for Ballina and Belmullet, if there was no other agency for doing so, or of bringing it to the notice of those who may be ready to invest capital in such projects. The latter is the course they can adopt under present circumstances, for since Lord Iveagh and Mr. Pirrie, as the Chief Secretary has recently explained, have undertaken to promote motor transit services in Ireland, assistance from public funds is now happily rendered unnecessary. The experts whom Lord Iveagh and Mr. Pirrie have appointed to make preliminary inquiries have seen the Hon. Horace Plunkett, Mr. T. P. Gill, and others, and their attention has been directed to the Ballina and Belmullet scheme, as well as to other parts of the North Mayo and North Sligo project into which the Department had not examined, so that it would appear that we are on the eve of a really great development.

THE PROBLEMS OF TRAFFIC.

NOT the least valuable of the services which the development of automobilism is likely to render the Country is the revival of the prosperity of the old roadside inns, and the resuscitation of the great high roads to the position of importance they held in the early Victorian days. In towns the congestion of traffic will be relieved, and the slow-moving, lumbering locomotion of to-day will be quickened into something like energy. But these problems, and the many associated therewith, can only be solved as the Local and National Authorities recognise their duties and obligation with regard to the highways.

At the outset, we would deprecate piecemeal reform and look with little favour upon the departmental schemes that have been brought forward. These are too restricted to be of practical value; the whole question has become complicated and complex—the tram-car, the motor-bicycle trailer, the railway crossing, the lumbering lengthy timber lorry, the hooded van, and other

Locomotives at the Zotokinn Temple, Yokohama, Japan.

modern innovations having made the situation at once acute and difficult of solution.

For instance, any attempt to raise the speed of motor-cars in towns would be rendered futile unless that of horse-drawn vehicles is considered. The speed of a Navy is controlled by the slowest vessel, and so the rapid progress of the motor vehicle would be restrained by the crawling cab which is supposed to maintain a speed of about six miles an hour. This is a small illustration of the great difficulties in the way. Motor and bicycle tracks have been suggested as capable of carrying the quick traffic, leaving special paths for horse-drawn vehicles and pedestrians. These look well on paper, but their execution would appal our County Councils if they were expected to find the money. Unfortunately it is frequently forgotten that the Act of Parliament governing the highways "in that part of Great Britain called England" was passed in 1835, when railways were curiosities, and people were only just beginning to realise that the locomotion that had done duty in the time of Noah might be superseded. Legislation passed in such a transition age could only be trammelled by narrow views and an incomplete survey of the future. No one then dreamed of the Mono-Rail, the Tube, and the Electric Tram, hurtling through

the streets at twenty miles an hour, and the motor-car even more effectually reducing distance. Developments of locomotion since then should have been followed by legislation as to the highways and street traffic. The passing of the Light Locomotives Act, 1896, made such a course absolutely imperative. But, as usual, shortsightedness prevailed and no regard was paid to the newer conditions that would result. These are becoming apparent; hence the urgency of the problem that now confronts all interested in the regulation of traffic both in urban and in rural districts. Some of the provisions in the Act of 1835 are particularly interesting, and we would suggest that local authorities should be called upon to enforce those relating to the misbehaviour of drivers in obstructing the passage of vehicles—both when drawn by horses or in such circumstances as are referred to by Baron Barreto in another column. In many places roads have been allowed to become narrow lanes owing to the neglect of the local authorities, and next week we shall show how the provisions of the Highways Act have been ignored. So that the demand for a thorough and complete examination of the whole position can be supported by ample evidence as to the need. Sectional proposals will not help the matter, and suggestions for differential treatment in regard to rows of variously moving traffic will not meet the case.

Not to the provision of separate tracks do we look for improvement in the present state of things. All that is required is the adoption and stringent carrying out of a few common-sense notions and wise regulations by which the progress and universal adoption of the automobile should be encouraged instead of hindered. Attention should also be given the extension of tramway tracks. There has been quite a rush in recent years to connect large centres of industry by tramway lines; but this is only a temporary excitement. The motor-car service is coming with cars that can deposit passengers outside their own houses and pick them up from side streets with a regularity that will contribute greatly to success in business. Still the tramway lines are a very tangible flaw in the surface of our streets and highways, and a real danger to the automobiles now running in and about the suburbs of all great towns.

These few considerations show the complications that exist; and how can such a vast topic be dealt with in any narrow spirit? A Commission is required to investigate and experiment? As a rule commissions only question and cross-examine; we should like to see one allowed to spend a substantial amount in the conduct of investigations calculated to ease the strain of the present position. Unfortunately doctrinaires generally make up the composition of such bodies; the experts who have given years of study and the men who are practically engaged in the problems to be inquired into, are left out in the cold or called in to be examined at the invitation of the committee. What is wanted is that heads of the police who deal with the traffic problems of great cities, the County Surveyors who know the dangers that lurk in the village street, the directors of the great parcels companies, the managers of bus companies and others should confer regarding the matter from the national point of view. Such deliberations would be more productive of sound and practicable suggestions than any number of Commissions issuing Blue-Books and doing little else.

MR. C. W. POTTER, of Leeds, has been fined £2 and costs for driving a motor-car on the footpath at Harewood.

MR. DAVID NUTT, whose publishing house is in the new motor-car thoroughfare of Long Acre, has issued the "Song of Speed," by Mr. W. E. Henley, in book form.

ARRANGEMENTS for the opening of Kew Bridge on Wednesday, the 20th inst., have been completed. The new bridge has a span of 133 ft., with outer arches of 116 ft. span each from the piers. The roadway has a width of 55 ft. On either side are footpaths 10 ft. in width, and the builders in the making of carriage and footpath width have, it is stated, allowed for the growth of traffic, both vehicular and pedestrian, for the next eighty years.

THE STANLEY STEAM CAR.

THE brothers Stanley, who, it will be remembered by old motorists, were the introducers of the steam car now known as the Locomobile, have recently again taken up the construction of steam motor-cars. Their vehicles are now being introduced into this country by Messrs. Joseph Cockshott and Co., Ltd., who exhibited the same at the recent show at the Agricultural Hall. We have already published a brief description together with a general view of the car (see issue of April 4th, p. 98), but as the vehicle comprises a number of special features a more detailed notice may be of interest.

boiler by carelessness in the maintenance of the water level, a fusible plug (see Fig. 4) device of a novel character has been adopted. One end of a small pipe is tapped into the boiler at a point near the bottom of the water space and the other end communicates with the water space at a point a few inches higher. There is a small T in this pipe, which is closed with a plug of fusible metal. In the normal operation of the boiler there is a constant circulation of water through this pipe from its lower to its higher extremity, but if the water level falls below its upper termination the circulation ceases, the water evaporates from the pipe, and the fusible plug, previously kept relatively cool by the water circulation, immediately melts

Figs. 1 and 2.—The Stanley Burner, Showing Covered Bottom.

Fig. 3.—The Stanley Transmission.
A, Driving pinion on engine. B, Driven wheel on rear axle.

Fig. 4.—End View of Stanley Boiler.
A, Fusible plug which projects through side of burner. B1, Superheating steam pipe. Steam passes from the boiler to B1, thence to C2, up through the boiler and across the top, finally out at C to engine.

Superheated steam is generated by the boiler, a high degree of superheat being obtained without recourse to intensely heated metallic surfaces. The boiler (Fig. 4) consists of a copper shell 14 in. diameter, bound by copper-plated steel wire. As the use of the traditional form of gauge glass is rendered almost prohibitive by the high pressures and degrees of superheat employed, the water glass has been discarded and an automatic indicating float has been adopted which instantly shows by the position of a small index on the right hand side of the driver whether the water level is low, normal, or high. This index can be read by the sense of touch, thus rendering a gauge lamp or mirror superfluous. In order to provide against the burning of the

and warns the operator. The plug is accessible and easily replaced without it being necessary to remove the burner. Within easy reach of the driver are the valves controlling the main burner, pilot light, and pump by-pass. The throttle is of the conventional form, but the reverse is controlled by means of a pedal. The burner is made of steel, and is provided with a pilot light. A distinct departure from the ordinary practice is found in the engine and transmission. The engine (Fig. 3) is of the double-cylinder horizontal type, the head being supported by a metal strap from the body, and the crank end being concentrically supported upon the rear axle. The cylinders are 2½ in. diam. by 4 in. stroke. A steel pinion on the crank shaft meshes directly with

a phosphor bronze gear on the differential casing on the rear live axle. It is claimed that the combination of steel pinion and phosphor bronze gear secures the minimum of noise and wear. A detachable copper case completely surrounds the engine, transmission, and differential. The lubrication of the cylinders is effected by means of a mechanically forced-feed lubricator, operated by a ratchet and pawl mechanism. The feed water pump has a variable stroke which can be adjusted to suit the requirements of the boiler. The brake, operated by a pedal, acts upon an extension of the differential casing. The weight of the vehicle with tanks full is 9 cwt. It is claimed that the Stanley car can cover fifteen miles per gallon of petrol under fair conditions, and can travel two miles on each gallon of water, speeds up to thirty miles per hour being attainable. The petrol tank has a capacity of 14 gallons, while 19 gallons of water can be carried. The car has a long wheel base—6 ft. 6 in.—the track being 4 ft. 3 in.

CONTINENTAL NOTES.

BY "AUTOMAN."

THE spring weather, so ardently desired by automobilists, both amateur and professional, seems this year to be heralded in very slowly. It is true that all the signs of spring are with us, and the country roads are beginning to look their best with the fresh green foliage and the new blossoms, giving ever new and refreshing colour to the scene.

M. Juvanon on his Rochet-Schnelder Racer, fitted with Continental Tyres.

All these and many other of Nature's signs annually announce to all and sundry that the spring time has arrived. There is now, however, a new sign by which everyone, great and small, whether living in town or in the country, can say to himself "The spring time has arrived." The airships (not the swallows) have arrived and may be seen veering and tacking in the skies. The same day, the 8th inst., brought out "La Jaune," belonging to the Lebaudy brothers, the sugar refiners, and run by Messrs. Juchmes and Julliot over the plains down the River Seine in the direction of Mantes; and also the Santos-Dumont No. 9, which is, so to speak, a toy balloon, and in which the plucky little Brazilian played all sorts of practical jokes on the legal guardians of the Bois de Boulogne.

It is needless for me to describe at great length the Lebaudy navigable balloon. Suffice it to say that the *aeronef* in question is about 60 yards long by 10 yards wide, contains a volume of some 3,000 cubic yards of gas, and is driven by two propellers which are revolved by a 40-h.p. Mercedes motor. The balloon is somewhat cigar-shaped, and with a *nacelle* suspended by steel ropes from a platform which is rather nearer the stern than the bows of the balloon, if I may be permitted to use these nautical expressions. The weight of the *nacelle* with its machinery and

passengers, ballast, etc., is about two tons. "La Jaune" started out from its shed at Moisson with M. Juchmes and a mechanic named Rey on board, and made straight for Mantes, passing over St. Martin la Garenne, Dennebont, and Gassicourt. Arriving at Mantes the balloon crossed over the town, and rising over the cathedral, turned round towards home. At this point the wind was felt, and it was necessary to increase the revolutions of the motor, which secured the desired result, enabling the balloon to sail against the wind, and to make for the Chateau de Rosmy, where all sorts of evolutions were performed over the grounds. Afterwards the ship was headed for home and arrived safely, after being 1 hour 56 min. in the air, and making the record journey of 37 kilometres (23 miles).

THE Santos-Dumont No. 9 is the smallest navigable balloon that has yet been attempted. It is made to carry only one person, and is propelled by a 3½-h.p. Clément two-cylinder motor, the power of which is transmitted direct to the fan by means of a cone clutch. The fly-wheel is made from a bicycle wheel, with the rim weighted. This curious little ship executed all sorts of difficult manoeuvres with and against the wind, and seemed to float above the Bois de Boulogne like a butterfly, landing here and there, and sailing off again with the greatest ease. Whilst amusing himself with this toy balloon, M. Santos-Dumont is hard at work preparing his No. 7, which is to be a racing balloon, with cubical contents of about 1,500 cubic yards, and which is intended for the competition at the St. Louis Exhibition next year.

THE general meeting of the A.C.F. took place last week, and was in many ways a remarkable meeting, for the note of the whole proceedings was success, financial and social. The Baron Van Zuylen in his presidential speech quoted the words of Levassor in 1893. Levassor was the founder of the great firm of Panhard and Levassor, and in those early days his great difficulty was to find customers for his cars, whereas to-day the difficulty is to find cars for the customers. In 1893 he remarked to Baron Van Zuylen, "Our cars are very good, but they won't sell; nobody wants them, notwithstanding that they run splendidly." In commenting on the marvellous progress that has been made in ten years, the Baron asked himself the question, "To whom is this success due?" and replied to his own question in unqualified terms, "To the Automobile Club of France." "On every side the success of automobilism has followed by leaps and bounds the big races that we have organised. After each of our races and each of our exhibitions thousands of new customers have come to us and brought grist to our mills, so to speak, and enabled us to found the works that at present supply our marvellous cars to the whole world."

I CANNOT help making a special mention of the words of the Baron Van Zuylen, as I have so often in these columns advocated the promotion of road racing under safe limitations in the United Kingdom. The Gordon Bennett race, I have no hesitation in saying, will be followed and be the direct cause of an immense increase in the automobile trade in the British Isles. It will, I hope, open the eyes of the general public and of those more particularly interested in the industrial welfare of our country, and show them that if only they will put aside for a moment their insular prejudice and look the question fairly and squarely in the face, they will find that the encouragement in future of one or two road races annually under proper safeguards in the British Isles will bring about colossal results from the point of view of the national prosperity in this special industrial branch.

THE Brothers Fournier, accompanied by Georges Prade, have just made a journey by motor-car from Paris to Madrid, and Prade writes to the *Auto* in glowing terms, praising not only the roads but the hotels and general reception in Spain, and comparing circumstances generally in that country most favourably with the similar circumstances in Austria last year. The general conclusion to be drawn from the various accounts and the different persons who have tried the roads

seems to lead up to the fact that the Spanish roads have been very much maligned, and that the race seems to promise a colossal success from every point of view.

M. HUET, the General Commissaire of the Paris-Madrid race, has sent a letter to all competitors, from which I take the following:—The different formalities of weighing-in, marking, custom-house, etc., will commence on the 19th inst. in the Tuileries Gardens, in Paris, at the Place de la Concorde entrance, and the cars must present themselves in the following order:—

May 19th, from 9 till noon	Nos.	1 to 30
from 2 to 5	31 to 75
May 20th, from 9 till noon	76 to 105
from 2 to 5	106 to 150

who is more than twenty-four hours in making the journey from Paris to Bordeaux will be disqualified for the remainder of the race.

For the Paris-Madrid race the Decauville Company have built four cars of 45-h.p. They have each four cylinders and three speeds, and will be driven respectively by Captain Genty and Messrs. Thery, Mestayer, and Uhlmann.

Owing to the date clashing with the Circuit des Ardennes, the Automobile Club de Rhone has postponed its kilometre race at Aix-les-Bains to the 26th June, and its speed contest to the 27th June.

THE Wolseley Company, which, it will be remembered, was

The Fleet of Brouhot Cars which Competed in the Recent Reliability Trials of the A.C. de Touraine. (See issue April 25th, page 157.)

[La France Automobile.

May 21st, from 9 till noon	151 to 180
from 2 to 5	181 to 225
May 22nd, from 9 till noon	226 to 255
from 2 to 5	256 to 300

The driver of each car must be present at the weighing-in, and must sign a declaration to be made to the Spanish Custom Houses. He must bring with him: (1) A sufficient sum to meet the Custom House duties for Spain—that is to say, £12 for motor-cars, and £2 8s. for motor-cycles; (2) the sum of 10 fr. (8s.) for a control box; (3) his *permis de conduire* and receipt for the declaration of his motor-car, which must be transmitted to the Commissary of Police, who will also be present in the Tuileries Gardens. As to the method of starting the cars, it has been decided to send them off at minute intervals—first, the heavy and light cars in order of entry; second, the voiturettes, ditto; and third, the motor-cycles in pairs and in order of entry. Any competitor

one of the two English firms to exhibit their cars at the last Paris Salon, have now gone a step further in their attempt to open up a trade in Wolseley cars in France by establishing a depot in the Rue Pergolese, Paris, under the direction of M. G. de la Neziere.

THE Automobile Club du Gard, of Nimes, is organising an automobile fete to extend from June 12th to 15th. On the 13th there will be a hill-climbing competition on Mont Aigoual, and on the 14th a series of kilometre trials on the Boulevard de la Republique, Nimes.

So far, 46 heavy cars, 14 light cars, 7 voiturettes, and 22 motor-cycles have been entered for the Circuit des Ardennes, which will be held on June 20th and 21st. The last date for entries is the 30th inst.

DOCTORS AND MOTOR-CARS.

NOW that the fad stage of the bicycle is past, thousands of persons still make use of the machine in a sane, conservative and useful way, because there is in it an inherent degree of utility. The bicycle has survived because it has been proved to be an easy, cheap, and pleasant agent for the transportation of a single passenger. As it has been with the bicycle, so must it be with the motor-car. It must stand or fall according to the measure of its utility. If it were to take its place merely as a vehicle of pleasure it would have its little day and would go the way of all fads. If it were to retain the form of a complicated and fragile vehicle, requiring the constant attention of the expert and the repairer, then its use would necessarily be limited to those who either possess the mechanical ability or the wealth necessary to take care of such a luxury. As a vehicle of utility the motor-car has already taken such a prominent place as to make its future assured.

The qualities which recommend the motor-car to the physician are those of endurance, comfort in travelling and moderate expense of operating. In addition to these merits there should be moderate first cost, simplicity, strength, and durability. As to the question of first cost, there should certainly be no objection to paying £200, more or less, for a vehicle, provided it be one that will last a reasonable length of time and not be a constant source of annoyance from breakages and expense for repairs. At the present state of development a physician may find in the market cars which will answer his purpose, and it is folly to wait until they "get cheaper" or attain nearer to perfection.

MR. CHAS. E. MILLER, of Reade Street, New York, has sent us a copy of his latest catalogue of motor-car and cycle accessories, which contains practically everything, from a complete car to a bolt.

THE Eastbourne authorities are so well satisfied with the motor-bus now running in the town that they are about to give out orders for others and to consider the adoption of motor dust vans and motor vehicles for street cleansing work.

The 20-h.p. Fischer Combination Petrol-Electric Omnibus built for the London General Omnibus Company. (See page 209.)

Coming to the point as to the use of motor-cars by the public in general and by the medical profession in particular, it is safe to say, remarks Dr. Jas. A. Mallock, in the "Horseless Age," that such general use will surely come about, but it must be preceded by a further development of the motor-car itself. There is no class of men who are watching with keener interest the progress of the automobile than the physicians of the country. No class of men are more dependent on individual means of locomotion. Almost every physician in the land must keep one or more horses, and upon the mileage of these horses largely depends the professional income. The average doctor spends considerably more time in travel than he does at the bedside of his patients. Many physicians, especially in the country, are liable at any time to be called on to drive fifty or sixty miles a day, which travel is a good day's work in itself. To most persons driving is a pleasure; to doctors it is hard and monotonous work.

MR. J. A. W. RATTY, of Duke Street, Henley-on-Thames, is a local dealer in petrol, and will be willing to help motorists during Henley week, which, unfortunately, clashes with the Irish Fortnight.

THE Central Motor Company, Limited, have moved from Tottenham Street to commodious premises near King's Cross Station, at 124, Euston Road, London. Mr. W. C. Birney, the managing director, has a competent staff in the repairing and other departments.

THE Automobile Club of Minneapolis is taking a firm stand with regard to reckless driving, a motion having been passed providing that any Club member who is known to have been guilty of driving at such a speed as to endanger life or limb shall be reported to the secretary of the Club. Upon the second complaint the matter shall be brought before the governors, and a third complaint shall be cause for the expulsion of the offender.

HERE AND THERE.

MESSRS. HUMBER, LIMITED, are bringing out a new 12-h.p. three-cylinder car.

LORD CARNARVON has just been elected a member of the French Automobile Club.

MESSRS. T. CROSS AND COMPANY, of the Mortfield Bleach Works, Bolton, employ a motor-wagon for the conveyance of cloth from their works to Manchester.

In the House of Commons, Mr. J. W. Phillips has presented a petition from Pembrokeshire County Council in favour of adequate taxation of motor-cars and cycles used for the purpose of pleasure only.

THE mechanical engineering department of the University of Illinois is conducting a series of tests upon a Packard petrol motor-car. From these tests the mechanical and commercial efficiency of the car will be determined.

WE recently had an opportunity, at the depot of the British Automobile Commercial Syndicate, of inspecting a 12-h.p. Clement car, fitted with a special body known as the Shrewsbury phaeton, designed and built by Messrs. J. Rothschild and Fils, Ltd. We give an illustration of the vehicle herewith, and may

MR. E. MIDGLEY has been recommended for appointment as an officer in the Motor Volunteer Corps.

THE Daimler Motoren Gesellschaft of Cannstatt has issued a notice that it is intended to prosecute all infringers of its patents relating to honeycomb radiators.

LORD HASTINGS, Sir Forrest Fulton, the Hon. Ailwyn Fellowes, M.P., and the Hon. Louis Johnstone have lately ordered cars through Messrs. Mann and Egerton.

THE Kreiger Electric Carriage Syndicate, Limited, has been registered with a capital of £30,000, to carry on the business of manufacturers of and dealers in motor-cars, etc. There will be no initial public issue.

THE Carlton Motor Company, of Cricklewood, have just opened a depot for their motor cycles, engines, and carburettors, at 27, Endell Street, Long Acre, W.C. Arrangements are also being made for the repair of motor cycles.

THE third of the series of engineering conferences organised by the Institution of Civil Engineers has been arranged for June 17th, 18th and 19th, at Westminster. The proceedings will be inaugurated on June 16th by the delivery of the "James Forrest" lecture by Mr. W. H. Maw, on the subject of "Some Unsolved Problems in Engineering," while among the

The 12-h.p. Clement Car, with Special Shrewsbury Phaeton Body.

mention that the principal feature is the novel way of entering to the rear seats. The left front seat is so connected by sliding joints to the front half of the lower panel, which acts as a door to the rear seats, that by pulling open the latter the front seat is swung round, thus giving the rear passengers access directly from the footpath, without the necessity of stepping into the roadway. The body of this fine vehicle is finished in brilliant chrome yellow, with black mouldings, the wheels and frame being similarly treated and picked out in black. The upholstery, which is of the most luxurious description, is in buttoned tan morocco.

DR. P. DVORKOVITZ has been lecturing on the "Petroleum Fields of the Far East," which now include those of Japan, Java, Borneo, and Sumatra. All those four fields have during the last four years developed to a very large extent, and last year the latter-mentioned field alone produced no less than 400,000 tons. The total production of the fields of the Far East was about 925,000 tons, which really came to about 5 per cent. of the world's yearly output, but the present progress of the fields show that in the near future they are destined to play an important part as oil centres.

topics to be discussed are the following:—"The Use of Petrol Motors for Locomotion" and "Applications of Electricity to Driving Carriages in Towns."

AN association called the Electric Automobile Club has just been formed at Buffalo, N.Y., for the storage of electric vehicles. The articles of incorporation state the purposes of the Club to be "the delivery of automobiles from a central station, where they will be kept charged and stored, to the residences of private owners of such automobiles; the repairing of electric carriages, and to keep and maintain electric carriages for hire, etc."

THE assistance of the Institute of British Carriage Manufacturers was recently obtained by Mr. Sanderson, coach builder, of Newcastle-on-Tyne, in order to obtain a reversal of a County Court judgment, which decided that he must bear the loss of injury to a dog-cart lent by him and damaged by the servant of one of his customers. The Council of the Institute, realising that the case was one which would establish a precedent detrimental to the interests of the trade, decided to co-operate in the proposed Appeal to the Divisional Court. This was successful, and the decision of the County Court Judge was reversed, therefore showing that customers are liable for damage caused by their servants.

A NEW list of agents for Pratt's motor spirit has been issued by the Anglo-American Oil Co., Limited.

MESSRS. TURGAN, FOY, AND CO. are building three steam omnibuses for a public service about to be started at Saas, Bohemia.

MR. W. F. THOMAS, of Inkerman St., Vauxhall, Birmingham, is putting on the market a new 10-h.p. double-cylinder car with a novel friction transmission gear.

MOTORIA, LIMITED, has been registered with a capital of £1,000 to acquire the business of an exhibitor and salesman of

The New 15-h.p. Brooke Light Car. (See issue April 18th, page 146.)

motor-cars carried on by Mr. F. Jessett. The registered office is at 2, Staple's Inn, W.C.

THE difficulty between the German Automobile Club and the Cannstatt-Daimler Company has not yet been settled, and there seems no immediate likelihood of a compromise. The whole trouble lies around the question of admitting professional chauffeurs or mechanics into the German Club, and the majority of the members at a general meeting have backed up the decision of the executive committee in refusing to admit Werner as a member of the Club. They have made a counter-proposal in suggesting that Mr. Foxhall Keene should pilot a Mercedes in the Gordon Bennett Cup in place of Werner. The Cannstatt-Daimler Company replied that Werner is their most skilled driver, and that they will not allow any Mercedes machine to run in the international race unless he steers one of them, as it would be risking a defeat to bar them from the services of their most skilled driver. Both the French and Austrian Clubs admit technical members or mechanics for the purposes of racing, although they have no power to vote, and none of the social privileges; but the German Club remains obdurate, and will not even make this concession, which seems to be a regrettable, unsportsmanlike position.

IN order to prove to the municipal authorities that the regulation which forbids motor-cars to exceed a speed of 12 kilometres an hour in Paris and the Bois de Boulogne is an unreasonable one, and that the limit might be considerably raised without the slightest danger, the French Automobile Club on Tuesday organised an excursion through the streets of Paris to show what can be accomplished by skilled motorists when driving at a high rate of speed. As those who had been invited arrived they were placed in the cars, which went off at intervals. The experiments were considered entirely satisfactory, and to have clearly demonstrated that motor-cars can very safely be manipulated in crowded thoroughfares. The experiments were continued in the afternoon in the Bois de Boulogne, and some novel tests were made. Baron Henri de Rothschild brought a 70-h.p. car, travelling at 50 miles an hour, to a standstill in about 40 yards, and an 8-h.p. car, going 20 miles an hour, was pulled up in 8½ yards.

THE King was a spectator of the races at Kempton Park, travelling to the course from London by motor-car.

MR. POTTER PALMER, of Chicago, has purchased a 60-h.p. Mercedes, to be delivered next month in Paris. Mr. Palmer is arranging for a European tour in his new car.

THE South Wales and Monmouthshire Automobile Club is to have a run to-day (Saturday) to Tintern. On May 23rd they go to Brecon, where they will be entertained to luncheon at the Castle Hotel by Captain Hughes Morgan, who is himself an ardent motorist.

THE Naas No. 1 Rural District Council has adopted a resolution protesting against the high rate of speed of motor-cars, and calling on the Local Government Board to bring in regulations so that cars might be numbered for purposes of identification. This is in consequence of the excessive speed recently indulged in by motorists in the district of the Gordon Bennett race course.

IN connection with the sparking plug "discovery" Mr. R. A. Glindon has sent for trial a specimen of the "Intensicator" he has recently put on the market. As will be seen from the accompanying illustration, the device is adapted to be fixed to the dashboard or any convenient part of a motor-car for intensifying the spark, and also indicating whether the electric ignition of an internal combustion motor is working correctly. When placed on the dash, those in charge of the car have always in sight the means of instantly localising the cause of almost any failure in the ignition, such as—(1) short circuit or leakage, (2) damaged sparking plug, (3) faulty contact, (4) unsuitable carburation, etc. It also prevents the batteries being run down without the driver's knowledge, for as soon as they are getting

low, the spark in the "Intensicator" becomes weak and intermittent. The points of the "Intensicator," which are enclosed in a glass tube, are platinum tipped, so that they cannot cause failure through corrosion. After having screwed the "Intensicator" to the dashboard or other convenient part of the car, where it can be easily seen by the driver, the wire conveying the high tension current from the coil to the sparking plug is to be connected, first from the coil to one terminal of the device, and then by means of an extra length of wire connect the other terminal of the "Intensicator" to the sparking plug. The gap can be adjusted by means of the vulcanite handle projecting at the top. The device is neatly finished and can be quickly fitted on any car.

MOTOR-CYCLING NEWS.

THE police in Belfast have been demanding the names and occupations of all persons using motor-cycles, and the Irish Attorney-General has informed Mr. Sloan, M.P., of the reason. Complaints have been made that motor-cycles were being driven at an excessive speed through the streets, and that the riders refused to stop when requested to do so. The police have accordingly taken the names of persons using these cycles in order to supply them with copies of the regulations issued by the Local Government Board on the subject.

THE hill climb arranged by the Irish Motor-Cycle Union to take place at Glenamuck Hill, about eight miles from Dublin, on Saturday, came to a sudden ending owing to the interposition of the Royal Irish Constabulary. The course was well lined with spectators, and two machines had made the ascent when the police interfered. At the top of the hill someone had drawn a trap completely across the road, just round the bend, and the competitors being unable to see this until over the mark, failed to check their speed completely, with the result that they collided with one another and the obstructing trap.

WE understand that Mr. A. Wright, who rode an Ormonde motor-bicycle successfully throughout the reliability trials last year, will ride one of the machines of this make in the Paris-Madrid race.

THREE motor-cycle races were included in the sports meeting held on Saturday last by the Midland Cycling and Athletic Club at the Aston Villa grounds. The rain which fell in the morning had the effect of making the track somewhat slippery, but, in spite of these unfavourable conditions, some interesting contests took place. A three miles motor bicycle handicap (engines not exceeding 2-h.p.) resulted as follows:—Heat winners: E. H. Humphreys, Bert Yates, W. L. Cook (45 sec.). Final: 1, Bert Yates; 2, W. L. Cook; 3, Humphreys. Time, 6min. 16sec. The one mile motor bicycle (not over 3-h.p.) time trials handicap brought out sixteen competitors. Owing to the greasy condition of the track there were two or three spills, resulting, happily, in no injury to the riders. The winner, W. W. Kennedy, who had a start of 8sec., covered the mile in 1min. 26 2-5sec. Martin and Coleman also gave creditable exhibitions. Each competitor was started separately from a mark about 80 yards behind scratch, the time being recorded from the instant the line was crossed. The winners of the heats in the five-mile motor-bicycle open handicap were Harry Martin, Bert Yates, Frank Arthur (50 sec.); A. E. Colman (35 sec.); S. Wright; T. H. Tessier (20 sec.); N. H. Burdin (40 sec.). In the final Yates and Martin started exceedingly well, but, to the great disappointment of all, both were compelled to drop out consequent upon mishaps to their machines. Wright maintained a remarkable pace and won in 6 min. 58 1-5 sec., Tessier being second and Coleman third.

MR. F. STRAIGHT has been appointed secretary of the Auto-Cycle Club, of which Mr. R. W. Wallace, K.C., is president, and Mr. R. Todd chairman.

At the Canning Town track, on Saturday, G. A. Barnes made an attempt on the hour motor-bicycle record from a standing start. From the first mile he commenced to beat previous times. His first mile was ridden in 1 min. 24 3-5 sec., which beats Martin's by 1-5 sec. In the second and third miles Rigal's figures were eclipsed, and from the fourth mile to the end of his ride Barnes beat F. W. Chase's records. Owing, however, to the rain, Barnes was compelled to retire after he had completed 27 miles in 31 min. 55 sec. In the half-hour Barnes covered 25 miles 690 yards. Ten miles were ridden in 11 min. 58 1-5 sec., 20 miles in 23 min. 40 sec., and 25 miles in 29 min. 33 sec.

CAPTAIN RUTHVEN, D.S.O., Messrs. O'Gorman, Sharpe, Basil

Joy, and F. Straight have been appointed a sub-committee of the Auto-Cycle Club upon matters in connection with the Irish Fortnight.

THE pastime of motor-cycling is making rapid headway in Austria, being fostered by the various trials and competitions that are being organised. On the 21st inst. the motor-bicycle section of the Austrian Touring Club will hold a meeting on the Prater track in Vienna, when races of one, ten, and a hundred kilometres will be run off. The Styrian Automobile Club is also organising a 100 kilometre road race for motor-bicycles; it will be run off on the 24th inst. on the Gratz-Trieste road, and will be followed by a hill-climbing trial.

THE Southampton County Motor Club held a run to Bournemouth on Saturday, the only mishap being a solitary puncture. The Club now numbers thirty members, and to-day's

run is to Andover, via Winchester, and home via Romsey. Our illustration is from a photograph taken on the Beaulieu and Lymington road, and depicts a scene on one of the Club's recent runs.

THE joint committee appointed by the motor-cycle trade and by the Auto-Cycle Club for the purpose of organising the trials of motor-cycles in August next, at a meeting held at the Automobile Club, decided that the trial fortnight shall extend from Monday, August 10th, to Saturday, the 22nd. The first day will be spent in assembling, checking and marking the machines at the Crystal Palace. The next four days, from Tuesday to Friday, will be devoted to daily runs of about 100 miles. No programme is arranged for the Saturday and Sunday, but the daily trials will commence again on the Monday and extend to the Friday. One day will be devoted to a long run, so as to bring the total mileage to about 1,000. On the final Saturday a race meeting will be held at the Palace, the first event being a speed contest for all machines taking part in the trials. The previously arranged standard of 3-h.p. was, after considerable discussion, abandoned, and the new method of classification by weight advocated by the Auto-Cycle Club adopted. A class will be included in the trials for private owners, who must be either members of the Auto-Cycle Club, or be introduced by a member, and who must not be connected, nor be about to be connected, with the trade.

At the North Ormesby and Middlesbrough Cycling Club sports on Saturday last A. A. Chase and C. F. Barden decided three matches on motor-cycles for £50. Chase won, but Barden's cycle went wrong, and he had to use a strange machine. Chase won the mile race in 2 min. 1-5 sec., and the two miles in 4 min. 2 1-5 sec. The five-mile event was won by Barden in 10 min. 49 4-5 sec.

CORRESPONDENCE.

NUMBERING PROPOSALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice that Earl Russell, after opposing the Bill introduced by Mr. Scott Montagu for numbering vehicles, has introduced one himself which provides for numbering and also for the drivers of cars being required to have certificates. So that he provides in his Bill what he professes to consider objectionable in Mr. Montagu's, and provides another serious obstacle to motoring in addition. Now I trust that all motor men who have any interest in anything except racing will do all they can to oppose the latter clause. No doubt to the men of large means who possess powerful and fast cars and a craze for speed, certificates are no disadvantage. At least, they do not think they will be. They do not care much what they spend on them, and of course drive themselves or only exceedingly skilled persons drive them. Consequently there is no inconvenience in the matter. On the other hand, as this type of car is the one that offends the public, of course its occupants wish to be recognised as little as possible. On the other hand, to people who require to use cars in the way that horses are used for ordinary daily work it is a very serious disadvantage indeed. Every person who for five minutes is going to touch the wheel even to take his car round from one door to another is to go to a private track, stay there till he has learnt to drive, and then presumably go to London to get a certificate. Further, it will naturally place the position of chauffeur in the hands of a closed profession, with of course a great increase in wages. This is a very serious thing to a comparatively poor man and a tremendous handicap to the use of motors of any kind for trade purposes. In fact, a man would be a fool who bought a motor van which could only be used at the will of a small body of certificated men, who might strike for unlimited wages at any moment, when he can get horses and carts, which can be driven by anyone.

On the other hand, there has never been shown to be the very slightest necessity for certificates at all. No accident that I know of would have been prevented by their use. One has just happened in Kingston. Would that driver have been refused a certificate? Of course not.

There is the further consideration of how it is to be enforced. Well, the only apparent way is for any policeman to be able to stop a car at any time and see the certificates. So that anyone who did not care about motors and had any control of the police would have every car stopped every time it passed a policeman for its driver's certificate to be examined. Jolly riding it would be on a nice cold day with a lot of rain and one's gloves to get off to reach into one's pocket every time, wouldn't it?

As to numbering, it is obvious that it is only of real disadvantage to those who do not wish to be recognised because they are ashamed of what they do. Consequently it is clear that as from the special circumstances motor men cannot be recognised like other drivers on the road, Parliament will take some means to have them recognised. So it is not much use bothering about whether we like it or not, and we had better make the best of it; but to add restrictions to free use of the roads is absurd.—Yours truly,

F. STRICKLAND.

THE IRISH FORTNIGHT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the supply of petrol in Ireland during the Gordon Bennett race and tour, I feel sure that purveyors of petrol in that country do not in the least sufficiently realise the enormous demand that will be made upon them. From my previous experiences of Ireland I know that it is impossible to obtain petrol in any quantities except in Dublin, and unless the wholesale houses make very serious preparations there will be a petrol famine. I believe that on a very low estimate there will be at least 500 automobiles imported into Ireland during the Irish tour, and I believe that the consumption of these cars will amount at least to 250 tons of petrol, or approximately 60,000 gallons. Taking my own case alone, as I intend driving a 60-h.p. Mercedes, I expect that my consumption of petrol will amount to between two and three hundred gallons.

I think it would very much facilitate the arrangements of those intending to tour in Ireland during this period if the wholesale purveyors of petrol would make a statement as to where they propose to have their depots, and exactly how much spirit they will have at each depot. We shall then be able to let them know how much we shall probably require, and thus avoid the terrible calamity of a petrol famine, which will certainly happen unless the most elaborate and careful preparations are made to deal with it.—Yours faithfully,

J. ERNEST HUTTON.

[In corroboration of Mr. Hutton's view we may mention that Mr. C. Cordingley will be in Ireland at least three weeks with his Star racer and his 40-h.p. Mercedes. His requirements will probably amount to between 600 and 700 gallons of petrol.—Ed. M. C. J.]

THE ABOLITION OF CHANGE-SPEED GEARING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The idea suggested by Mr. M. L. Vealey for a compressed air

driven car is not new, although, in my opinion, it is one that would well repay any firm to experiment with. I am chief draughtsman to one of the leading motor-car builders in Great Britain, and some time ago designed a car on these lines; my directors not seeing their way to take up the suggestion, I did not feel justified, owing to my position, in taking any further steps in the matter.

There are many points in favour of the air engine; but economy in lubricating oil is not one of them. Mr. Vealey must bear in mind the petrol engine has still to be lubricated under very much the same conditions. The chief advantages are economy in wear and tear, easy control, having the use of the reverse as a brake, and being able to reserve power for hill climbing.—Yours faithfully,

RELIABILITY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We notice under this heading in your issue of the 9th inst. that your correspondent, Mr. M. L. Vealey, does not believe in sliding gears at all, on the plea that after a certain period of use by an amateur they are stripped, and generally damaged. We would point out that this is not the case by any means, and it seems a pity that such an idea should prevail concerning the Panhard type of gears. The gears on the 7-h.p. car that we supplied to the Automobile Club are not damaged in any way, notwithstanding the fact that forty-five novices have learned to drive in this car. We think this will show your correspondent that a good sliding gear is manufactured.—Yours faithfully,

THE STAR ENGINEERING CO.

HIGH-SPEED TREMBLER COILS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to "One Tired of Adjusting the Trembler," I may say that I have driven a De Dion for nearly three years and was also tired of adjusting the trembler. I bought an Auto-trembler from Messrs. Riches, and inserted in the present wiring of my primary circuit. I then screwed up the platinum-tipped screw below the trembler so as to make good contact. Result: No misfires at any speed, and I am inclined to think I get a better explosion. Since then I have exchanged my trembler plate for a pear-shaped "Nil Melior" contact maker, not of necessity, but because my plate was worn out. I shall be pleased to show my arrangements to your correspondent if he wishes it. The Auto-tremblers are fine.—Yours truly,

G. WASHINGTON ISAAC.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If you will be kind enough to put "One Tired of Adjusting the Trembler" into communication with me, I shall be pleased to tell him of a little addition, costing 30s., which will convert the De Dion mechanical trembler into a high-speed electric trembling ignition without having to discard the existing induction coil or the contact breaker. I am delighted with the effect of this little affair on my 8-h.p. De Dion, and find that the power of the engine is distinctly increased. I now have no trouble at all to start the engine. Your correspondent would be pleased with the device, which is quite small.—Yours faithfully,

N. J. ASTLE.

[We believe Mr. Astle refers to the "Auto-trembler" mentioned in the preceding two letters.]

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Like your correspondent who is "tired of adjusting the trembler," at one time I could have subscribed myself in the same fashion.

But four months ago I had fitted on the primary circuit an "Auto-trembler," and though using my 8-h.p. De Dion car daily, and very frequently during the night, I have not the slightest trouble. The contact screw can be put well forward to make practically a positive contact—without a tremble—and though put to the severest test of stopping and starting thirty or forty times a day, it is very unusual to have to pull over the starting handle, even a second time. Misfires when running, due to cleaning and attention to the ignition, are of rare occurrence.

I have fitted the neat little "Auto-trembler" to the dashboard at the side of the water tank. I may add, I first tried a high-speed coil, but found it markedly slowed the engine, and consequently lost power.—Yours faithfully,

JOHN McCLEYMONT, M.D.

THE QUARTERLY 100-MILE TRIAL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see that Mr. Cohen takes exception to the note appended to my report on the running of the 10-h.p. Chenard-Walcker car in the Quarterly 100-Miles Trial. I did not in any way suggest that the car should have been driven faster, but I certainly consider that the rules were broken by the stopping of the engine on every possible occasion. I told Mr. Cohen's representative that to earn a non-stop certificate it was necessary for the whole distance to be run without either the engine or road wheels being stopped except, in the case of the latter, for traffic. In spite of this

the engine was at rest for at least 25 per cent. of the total running time. I think, therefore, you will see that my note was only fair comment; and, indeed, was a necessary addendum to my report to the Club committee.—
Yours faithfully,

ERNEST DE WILTON.

THE MANNERS OF HORSE DRIVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Yesterday (Sunday) I witnessed what I consider most disgraceful conduct on the part of some persons driving a horse-drawn vehicle—a two-wheeled trap, rarely seen in any part of England except in Norfolk, which consists of a square covered-in box on two wheels, the reins entering the front window. I was passing along the London Road just outside Dereham, and the vehicle was just in front of me and proceeding in the same direction. A motor-car containing four men was coming in the opposite direction, the driver sounding his horn warning his approach, but the person driving the box-like cart made no attempt to pull to one side of the road, and persisted to keeping in the middle. When almost opposite to the car, which had then approached, it seemed as though the cob was purposely pulled towards the car, with the result that the driver of the car, to avoid a smash, turned to one side, which caused the car to shoot into the ditch all four wheels, no attempt being made by the persons in the trap to stop or even ask if the occupants of the car had been injured. They drove off at a faster rate than before. I quickly overtook the trap with my car, and it was with considerable difficulty, and some distance was travelled, before they would pull out of the centre of the road to allow me to pass. Having got in front of the trap I then found it was not necessary to stop them, as by then the four occupants of the upset car were all standing up apparently uninjured, and shouted that they required no assistance.

This type of horse-drawn vehicle is a very dangerous one, many of them having no windows at the sides, and owing to the reins passing through the window in front a whip cannot be used; there is, therefore, no possible control over the horse. We hear so much with regard to the conduct of motorists that I think we should hear something about the conduct of persons driving horses on the road.—Yours truly,

BARRETO.

THE ELIMINATING CONTEST.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have noted in your columns a letter from "Motor Sportsman" dealing with the inadequate character of the eliminating trials, and I am writing to state that I think exactly the same. I do not at all wonder that the Star Company have protested, as your correspondent states, and I hope their protest will bear good fruit, and also that their challenge will be accepted by Mr. S. F. Edge.

As a spectator at Clipstone, and as a designer of cars, I think that it will hardly be fair if the Napier are allowed to put three cars in the Gordon Bennett Race, in view of the excellence of both the Star and Wolseley machines. A great many people said to me, "I wonder why they race for only a mile?" "How do we know that if they raced for twenty odd miles that the Star wouldn't have beaten the Napiers?" I will not trespass further upon your space, but I should like finally to say that I should be pleased to see a Napier, Star, and Wolseley in the Gordon Bennett without any further "Club arguments," or, if this is objected to, at least to test these three for a distance of about fifty miles.—Yours faithfully,

ANOTHER MOTOR SPORTSMAN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the letter appearing in your last issue under the *non de plume* of a subscriber calling himself "Motor Sportsman," would it not be more sportsmanlike if this gentleman advised the Automobile Club of the locality of one of the many estates where he states a circular racecourse could have been obtained to run the eliminating trials on? The Automobile Club did the best thing possible under very difficult circumstances owing to the law in this country, and it seems to me scandalous that a gentleman who calls himself "Motor Sportsman" should know of parks where races could be held and never tell the motoring world.

If he is not satisfied that the Napier is the best car to represent the three places for Great Britain for 1903, he might note that I shall be very pleased to run against any English car at present made, in August, every day from the 1st, for a stake, the whole of which is to go to the winner, of not less than £500 per race per day; so that he, the "Motor Sportsman," would not have the slightest difficulty in settling once and for all which is the best car at the moment in Great Britain.

Referring to Mr. Lisle's letter in your last issue, suggesting that he wishes to race a Napier car, I shall be very pleased to race him after August 1st—every day if he wishes it, up to thirty or forty days—but the race each day must be for a sum of not less than £500—the winner to take the full amount.—Yours truly,

S. F. EDGE.

MR. A. WINTER writes: I have a Peugeot car (8-h.p.) which, when throw into top speed, makes a lot of knocking in the engine. I have just had new crank and shaft brasses fitted. I am wondering if any of your correspondents could give me some idea why this should happen.

DRIVER LENT TO CUSTOMER: WHOSE SERVANT IS HE?

At the Brompton County Court (London), last week, before Judge Stonor, Mr. J. Best, butcher, Montpelier Street, South Kensington, W., brought an action against Messrs. Rawlings Bros., Ltd., electrical engineers and motor-car manufacturers, Gloucester Road, W., claiming £22 in respect of injuries to a horse and damage to a cart, said to have been caused through the negligent driving of a motor-car by one of the defendant's servants. Mr. Attenborough appeared for the plaintiff, and Mr. Vaughan Williams defended. A. W. Ebsworth, in the service of the plaintiff, stated that on 19th January last he was driving a horse and cart down Montpelier Street in the direction of Brompton Road, W. On his reaching Brompton Road two vehicles going along that thoroughfare waited for him to get across to the farther side, but the motor-car suddenly shot out from behind the two vehicles and "lashed" into the horse and cart. Witness was driving at about five or six miles an hour, while the motor-car came along at from ten to fifteen miles an hour on its wrong side of the road. Mr. J. Ovey, Park Place, W., stated that he was the owner of the motor-car in question, which he entrusted to the defendants to mind and keep in repair for him. He had been in the habit of telephoning to Rawlings or leaving a message at their office when he required the motor, and they charged him at the rate of £1 a week, and made a small additional charge for sending the car to his flat. The man who was driving the motor-car at the time of the collision was not his servant, for he paid him no wages, although on one occasion—and only one, he believed—he gave the man a "tip" of a couple of shillings or so. This man was employed by Rawlings Bros. Mr. Vaughan Williams (to witness): Do you know it is the universal custom of the trade that when a man goes out from a firm to drive a car for another person he is under that person's orders? The Judge: But it is a question of common law. I don't see how trade custom can affect the case. Mr. Vaughan Williams read notices upon billheads of certain motor-car manufacturing firms to the effect that the firms would not be responsible for anything which might happen when their men were driving other persons' cars. His Honour came to the conclusion that the driver of the motor-car became frightened and dashed across the road to his wrong side. Mr. Vaughan Williams submitted that even if that were so his friend could not succeed in the present action unless he was able to show that the collision was caused wholly through the fault of the driver of the motor-car. The evidence, however, showed that the plaintiff's driver was not free from negligence. But he would ask his Honour to hold that the keynote, so to speak, to the question was this: Whose vehicle was it? It was quite immaterial that the man driving the motor-car was in the general service of another firm. His Honour: No, I cannot agree. I do not think so. Mr. Vaughan Williams: I do not wish to be unduly persistent, but this question of custom is of great importance to the motor trade. His Honour: I think that the plaintiff's driver was also guilty of negligence, and I find for the defendants, therefore, but I shall allow no costs.

MOTOR-CAR ACCIDENTS.

An alarming accident occurred at the foot of Kingston Hill, Norbiton, on Saturday morning. Lord Alan Percy (second son of the Duke of Northumberland), the Hon. Myles Ponsonby, and Major Russell were returning from London to Pirbright on a motor-car, and when they were near the bottom of the hill a carrier's cart came out of a side street. The driver stopped the engines and applied the brake, but at the moment one of the tyres burst, the car swung round, and dashed into the window of a draper's shop. All the occupants were thrown out, and the Hon. Myles Ponsonby received the more severe injuries, and was detained at Kingston. Lord Alan Percy sustained some cuts, but was able to return to London. Major Russell and the driver escaped injury.

ALBAN GENTILH, eighteen, a motor-car driver, surrendered to his bail at the Marlborough Street Police Court, before Mr. Denman, to answer the remanded charge of furiously and recklessly driving a motor-car in Hyde Park, and causing serious bodily harm to William Smith, of Vauxhall. The injured man said on March 17th he went for a bicycle ride with a friend in Hyde Park. He was riding on his right side of the road. After he got to Apsley Gate he remembered nothing till he found himself in St. George's Hospital. At the time of the accident he was only going at the rate of about six miles an hour. Mr. Staplee Firth cross-examined the witnesses at great length, and in defence urged that the accident was caused through Smith running into the motor-car. Mr. Denman committed the defendant for trial, allowing bail in the sum of £100.

NO LIGHTS.

MR. W. R. SPENCER, manager of the Royal Hotel, Grimsby, was summoned at Grimsby on a charge of riding a motor-bicycle without a light. The defendant was ordered to pay 7s. 6d. costs.

CHARGED with driving a motor-car without a light after nine o'clock in Princes Street, Edinburgh, on a recent evening, a motor-car driver stated that the vibration of the car put the lights out coming from Waterloo Place, and as he was only going to the hotel he thought it would be all right, if he lit up again there. Sir Andrew McDonald imposed a fine of half-a-crown.

Where no alleged speed is given it is understood to be above the legal limit.

* Motor-Cycle Cases.

Just for a change there was only one case of a motor-car being driven at an improper speed at the Shoreham Court one day recently, Ernest Boll being so accused. This occurred so far back as February 16th last, Superintendent Hooker explaining that it had not been possible to serve the summons before. Police-constable Bristow stated that on the day

in question defendant travelled through Southwick at the rate of twenty-four miles an hour. He gave the name of Boll, and his address as Piccadilly, this being false. Witness saw him again on April 20th, and on the following day served him with the summons, personally, at 15, Blatchington Road, Hove. Defendant then declared he was in Paris on the day in question. Witness, however, was certain as to his identity. A witness living at Southwick said that on the day in question defendant passed him at the rate of at least twenty miles an hour. Defendant, whose real name was said to be Bernard Barthelmy, was ordered to pay £10 17s., including costs.

ALFRED RATCLIFFE, a working youth, of Haslingden, was summoned at Accrington for furiously riding a motor-bicycle. Police-constable Clarkson and Police-sergeant Bale said the defendant was riding a motor-bicycle at the rate of twenty miles per hour. Defendant said it was his first time on a motor-bicycle, which he had got on the hire system, and he was trying it. The Mayor told the defendant that he had acted in a straightforward way, and they didn't wish to press unduly upon him. Defendant would have to pay the costs.

At Nottingham, Arthur Callan, of 23, Ash Road, Saltley, near Birmingham, was summoned for having furiously driven a motor-car along Lister Gate, on the 25th April. The evidence showed that the defendant, who was in charge of the 50-h.p. Wolseley car belonging to Lieut. Mansfield Cummings, which had been to the Automobile Trials at Clipstone, was driving in the direction of the Midland station, at the rate of sixteen or eighteen miles an hour, and had to be followed there in order to obtain his name and address. Callan denied that he was driving fast, and urged that it was a case of mistaken identity. Defendant was fined 30s.

In the cases at Settle the officer stated that he was on duty in plain clothes, and, standing at the finishing point of the course, he timed them over a distance of 220 yards, starting the timing the moment he saw them round the curve at the beginning. The alleged speed was fifteen miles an hour. The defence pleaded it was impossible that the officer could tell the position of the advancing car from where he stood, as the time of coming into sight would vary according to which side of the road the car was on. The road averaged eight yards wide round the curve, and the line of sight from the point of obstruction to the opposite side measured 39 yards. It seems unreasonable that a conviction should follow on the evidence of a single officer armed with a stop-watch.

In regard to Mr. Foxhall P. Keene, who was fined £10 and costs, it was stated that he was travelling at thirty miles an hour, and refused to stop when hailed by the police. The chairman of the Norman Cross (Hants) magistrates said it was the worst case that had come before the Bench.

POLICE TRAPS.

AT Hartley Wintney, on the main road from London to Odiham (Hants), is a police trap of the orthodox quarter of a mile in length.

THERE is a measured track of highway *en route* from Preston to Lancaster and Windermere, and on a recent day five motorists were trapped, the victims including Mr. J. Wearing, a nephew of Lord Ashton.

AT Selsey, near Bognor, on the south coast, the police have a measured quarter of a mile.

JUST beyond Hook, on the way to Basingstoke, is a measured distance and motorists should beware of the activity of the police in that direction.

OBSTRUCTION.

At the Newcastle Police Court, Walford Bodie, commonly known as Dr. Bodie, has been charged with having, on April 25th, in Grey Street, wilfully obstructed the thoroughfare by means of a motor-car. Police-constable Thompson stated that about 2.15 p.m., on April 25th, he saw defendant bring a motor-car to a standstill. He then went into a shop, and left the car outside from 2.15 to 3.15. Meanwhile a large crowd gathered, and vehicles could not get past. Superintendent Findlay: He was here in 1896 for obstructing the police, and fined 40s. and costs. A fine of 10s. and costs was imposed. Defendant did not appear.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, MAY 23, 1903.

[No. 220.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

SATURDAY was a drizzling uncertain sort of a day, the copious weeping of the clouds in the early morn dampening the enthusiasm for a day's motoring, so far as the fair weather devotees were concerned. Venturing as far as Salisbury we managed to find some dust, which apparently surprised many of the people of Old Sarum who had experienced an early deluge. The old Close looked delighted with the early greens of spring flowers,

and very few people disturbed the cawing of the rooks, whose harsh grating sounds were in strange contrast with the aspect of seclusion. On oneside of St. Anne's Gate, leading from the busy road to the Cathedral, were ladies sketching; on the other a very modern painting on a newly placed notice board to this effect:—"Motor cars are not allowed in the Close except on business and only when driven slowly. It is forbidden to drive them up and down or to use the Close roads for practising purposes. By order of the Dean and Chapter." Why does not the same thoughtful spirit characterise the local authorities, and lead them to prohibit the exhibition of trunks and portmanteaux and other "utilities" under the Poultry Cross to the annoyance of photographers and the disfigurement of a beautiful memorial of a past age? As the advertisements say, "local papers, please copy."

Legislation Looming.

IN the agricultural town of Trowbridge on Saturday Mr. Walter Long made an announcement with regard to his views on automobile legislation which must have shocked the bucolic wiseacres of the county. He declared that the limitation of speed to twelve miles an hour gave no security to the public; that the present law was a farce, and that the present police methods ought not to be adopted. Such a threefold condemnation of the present state of things must surely be followed by an early reform. Mr. Long referred to the resentment felt in agricultural districts to the suggestion for the removal of the speed limit and clearly indicated how completely he was at variance with their view. Evidently the removal of the speed limit is in contemplation in the proposed Bill and some means of identification will also be required. Let us hope—in facing what is apparently the inevitable—it will not take the form of the conspicuous numbering about which so much has been heard. Reasonable means of identification will not be stoutly opposed, and hence the Government will be well advised in not humiliating the pioneers of the new locomotion too much.

The Lords and the Bill.

THE Earl of Camperdown suggests that the new Bill of the Government should be introduced into the House of Lords before discussion in the Commons, where Mr. Cathcart Wason will probably be prominent in opposition. Lord Balfour of Burleigh thinks well of the suggestion, and the matter is under the consideration of the Secretary for Scotland and the President of the Local Government Board. Whatever is done

will have to be done quickly, for, as was made clear by the discussion in the Upper Chamber on Tuesday, the present state of affairs is unsatisfactory to motorists, police, and magistrates alike. The Earl of Wemyss initiated a brief discussion on the lines indicated in last week's *Journal*, and the Marquis of Granby followed with a plea for the abolition of the speed limit and the licensing of drivers. In reply Lord Balfour of Burleigh agreed that, while there must always be some limit of speed in populous places and narrow roads, it was obvious that, if they put distinguishing marks on motor-cars, so that those who did wrong might be easily identified, there ought to be a much more liberal allowance in the matter of speed. He attached the greatest possible importance to having distinguishing marks; but the whole fraternity of motor-car users should not be penalised for a small minority of their number. It was the desire of Mr. Long to introduce the Bill at the earliest possible stage.

Mr. Jarrott to visit America.

SOME interest will be created by the announcement, which we are able to make on the best authority, that, during August, a series of International races will take place in the United States. Mr. Charles Jarrott, having performed doughty deeds in the Gordon Bennett race, will journey to Syracuse, for the purpose of taking part in some motor-car races, which are being arranged by Mr. C. A. Benjamin, the representative of the H. H. Franklin Manufacturing Co. in that city. It is also probable that a race will take place between Messrs. Jarrott, Winton, and Fournier, near New York, so that, in a small way, the Americans will be treated to something like a repetition of the International event, which is at present exciting so much interest.

The Portsmouth Club.

ON Saturday last the Portsmouth Automobile Club opened its second season with a run to Hind Head. Although the weather was still a little cold a dozen cars and as many motor-bicycles started from the George Hotel, Portsmouth, amongst the passengers being the Mayor and Mayoress (Sir William and Lady Dupree) together with several of the Portsmouth Corporation. At the Royal Huts Hotel, Hind Head, tea awaited the motorists and his worship presided over a party of fifty. On the return trip the cars dispersed, several following an alternative and longer course home. Among those present were Mr. Knight on a 9-h.p. De Dion, Mr. F. Blake on a 10-h.p. Dennis, Mr. H. Blake with his 12-h.p. Daimler, Mr. Cox on his 11-h.p. Clement, on which also rode the Hon. Sec., Mr. C. Sapp, Mr. B. Isaac on his 9-h.p. Clement, and Mr. Ashley, on his Lanchester.

Roads to Prosperity.

THE Gordon Bennett Race will have the effect of improving the roads of Ireland, not only within the area of the route, but also of the counties lying near. This movement is likely to be extended throughout the country, and the increase of roads built with easy gradients, and communicating with

cross roads and farm lanes, should open up a profitable artery of traffic from places now quite inaccessible, so far as the railway is concerned. We give prominence to this at the present juncture because there is a feeling in some quarters that the forthcoming race will be of transitory value to the country. This is a wholly inadequate view of its influence. There is no doubt that it will not only popularise automobilism, but also inspire some of the local authorities to follow the example of Eastbourne, for instance, and develop municipal services for goods as well as for passengers. Not only that, but private enterprise will also be encouraged, and the new prosperity that seems to be coming for Ireland will be considerably aided by the general adoption of self-propelled vehicles for agriculture and for all other traffic.

For Market Gardeners.

ONE of the great difficulties of the British fruit grower is the risk of losing the market. By missing the train by a few minutes a delay of several hours may result, and when the produce reaches London it is practically unsaleable—certainly it cannot be disposed of profitably. But with the advent of the motor-car such losses can be obviated, the motor-car rapidly recovering lost ground and bringing the fruit to the market in good condition and in good time. Every morning three motor-lorries may be seen in Covent Garden, having brought produce from the market gardens of Essex, and the punctuality of their appearance has been a matter of comment to those depending on the rail and horse, and of gratification to those who send their goods by that means.

The Glasgow-London Non-St p Run—Mr. H. Prosser on the 10-h.p. Wolseley.

Ladies as Drivers.

AN advertisement in the columns of the Journal for young ladies for driving motor-cycles has attracted some attention, and has been welcomed in some quarters as a new profession for our daughters. There is no doubt ladies have become enamoured of the automobile, but whether their attraction will be so great as to cause them to take it up as the serious work in life remains to be seen. We doubt whether it will prove to have so magnetic an influence as that.

Motor-Wagons in the Soudan.

AUTOMOBILISM is going ahead in the Soudan, and, although the first steam van sent out proved too expensive and the working parts were too near the ground, a later vehicle has done extremely well. This is the Milnes-Daimler lorry that took part in the War Office trials at Aldershot. In Egypt it has done

good work at Halfa camp, and at Barber. At the latter place it was inspected by the Sirdar and the leading officers of the army after conveying the Atbara memorial stones to the battlefield, a distance of 65 miles. The lorry carried five tons, and made the double journey with only one stop. Altogether it would appear that the work of the British authorities in Egypt will be materially assisted by the modern automobile.

M.P.'s and Motor-Cars.

A CIRCULAR was lately sent out by the agent for the Doncaster Conservative Association, intimating that Mr. Fison, M.P., would visit certain parishes in his constituency in a motor-car on certain days. Five days were set apart for the tour, and during that time nearly every place in the division was visited. "It will be much appreciated by Mr. Fison if you" (the recipient of the circular) "can see your way to gather together any friends who may be desirous of meeting the member, and who would be glad to have some conversation with him during the time he will be making a call in your parish." This is a new development of political interest made possible by the automobile. But care must be taken, and the motor-car must not be made the subject of jokes, as Mr. J. A. Fyler, the recently-elected M.P. for the Chertsey division, has just discovered. The other day he presented first-aid certificates to members of the St. John Ambulance Association at Addlestone, and in doing so he made some chaffing remarks about the value of ambulance men in respect of motor-car accidents. Subsequently the hon. gentleman proceeded by motor-car to Frimley, near Camberley, to address a meeting. When half the distance had been covered, his hat blew off, and the driver slackened speed. Mr. Fyler essayed to leave the vehicle while it was still in motion, with the result that he was pitched head foremost on to the ground, his right hand and wrist being severely cut. Although in great pain, he continued his journey, and kept his engagement at Frimley. But no more jokes were made.

The Sheffield Hill Climb.

ON Saturday the Sheffield and District Automobile Club held a hill-climbing competition at Padley Wood Hill. Mr. E. F. Coupe, the treasurer of the Club, acted as chief marshal, the other officials being as follows:—Timekeepers, Messrs. T. H. Woollen and W. E. Cope; assistant timekeepers, Messrs. T. Lonsdale and Cooper Pearson; umpire, Mr. J. Hoyle-Smith (secretary to the Manchester Automobile Club); hon. secretary, Mr. J. R. Wade. There were in addition some twenty or thirty observers. Below we give the marks obtained by the leading competitors, these being calculated on the number of passengers carried, price of car and rate of speed.

H. Cooper, Wolseley, 10-h.p.	963
F. G. Smith, Locomobile, 4½-h.p.	870
James Barber, Belsize, 12-h.p.	856
A. Truelove, Belsize, 12-h.p.	854
J. H. Pickford, Wolseley, 10-h.p.	787
H. F. Hobson, Century, 3½-h.p.	778
W. N. Drew, Wolseley, 7½-h.p.	757
P. W. Fawcett, Humber, 12-h.p.	658
F. Churchill, Hallamshire, 10-h.p.	623
T. G. Revill, Boyer, 6½-h.p.	623
P. B. Thomson, M.M.C., 8-h.p.	572
Ben Hind, Clement, 9-h.p.	551
J. Ellis, M.M.C., 8-h.p.	405

There were three competitors in the cycle section, and after the event tea was partaken of at the Maynard Arms.

"Motoria," Ltd.

LAST week we recorded that "Motoria Limited has been registered with a capital of £1,000 to acquire the business of an exhibitor and salesman of motor-cars carried on by Mr. F. Jessett. Now comes the prospectus of a "universal motor-mart," in which the prominent position of the automobile.

is set forth and a "boom" is foretold. The company—which must not be confounded with the firm of similar name in Balderton Street, W.—proposes to establish a motor-mart in the West End and makes a special point of the fact that it "has secured the services, as managing director, of Mr. Fredk. Jessett, who for many years has been engaged in promoting trades' exhibitions, and who has for some time past actively interested himself in automobile matters. Mr. Jessett was recently invited by the principal Association of Omnibus Proprietors to advise as to, and submit the best build of, a self-propelled omnibus for their requirements, and was similarly requested, in respect to a motor-tricycle, for tradesmen's delivery purposes."

Deposits Wanted.

SPACE in the Mart will only be guaranteed to those applicants who send ten per cent. of the amount of their applications, and commission on sales effected by firms associating with the venture will be chargeable at the rate of five per cent., payable monthly. Proper books of accounts of such sales must be kept to be produced on demand to auditors appointed by the concern.

which is not usually meted out to servants in his capacity. There are at present no recognised conditions of motor service, but the new employment will gradually work out its own course and something like custom be established. Hence the necessity for those employing drivers and others in connection with their cars to be thoroughly explicit in all their engagements.

The Storage of Petrol.

FROM the regulations of the Home Secretary with regard to the storage of petrol, published on another page, it will be seen that there are two methods in which petroleum spirit required for use in motor cars may be kept. The first of these will be the usual method, namely, to keep in accordance with these regulations; but where a person finds that for some special reason he cannot observe one of the Regulations 4, 5, or 6, he may resort to the second method, namely, to apply to the local authority for a license. In such cases the place will be examined by the local authority officer, who will advise the local authority as to its suitability for license. Where a license has been granted, Regulations 4 to 7 no longer apply. In no case is petroleum spirit kept wholly or partly for sale exempt from the necessity of a license.

M. Toste on the 80-h.p. Panhard he will drive in the Paris-Madrid Race.

Motor Mail Vans.

MR. AUSTEN CHAMBERLAIN has stated in the House of Commons this week that the motor-vans which had been used for the conveyance of parcel mails between Liverpool and Manchester from May 1 to June 20, 1902, and from November 23 to the present time, broke down on thirty-one occasions. On eighteen of these occasions the mails had to be transferred to other vehicles. On the other thirteen occasions the motor-vans were able to complete the service after some delay. The delay in the arrival of the mails varied from thirty-two minutes to four hours twenty-nine minutes.

Master and Man.

SOME time will elapse ere the difficulties now connected with the employment of mechanics will have passed away. The other day a Bath motorist had a dispute with his man, and both parties appeared in the local police court, the driver being fined £1 for an assault upon his employer. The affray seems to have been one in which considerable temper was displayed, and the employee apparently expected treatment

Time Tables.

THE motor-car service between Bromley (Kent) and Cudham has re-commenced for the season, this being the third year it has been run. There is no railway service in this particular district; hence one reason why it has been so much appreciated. The route taken is *via* Hayes and Keston, and a capital time table has been issued by the promoters of the service. From Hastings, too, comes a time table of the motor buses now running there, and a table of fares for motor-car trips to places of interest in the locality and also to more distant resorts, such as Brighton, Eastbourne, Pevensey, Rye and Winchelsea.

Eastern Counties Automobile Club.

THE inaugural run of the newly-formed Eastern Counties Automobile Club took place on Saturday. It was originally intended that the first run should be to Bury St. Edmunds and Diss, but the destination was changed to Clacton-on-Sea *via* Great Bentley. The weather was fine during the outward run, but as soon as the party got to Clacton rain

commenced and lasted some hours. Amongst those taking part in the run were Messrs. W. T. Pretty (Ipswich), F. L. Bland (Copdock), C. D. Castell (Wickham Market), W. H. Blomfield (Ipswich), G. Milbank (Ipswich), G. C. Ching (Ipswich), Dr. Longworth (Melton), J. R. Egerton, with whom was Dr. Moseley, the hon. sec., A. Hackblock (Ipswich), etc. At Great Bentley the party was met by Colonel Davis, the High Sheriff of Essex, who headed the procession to Clacton, a distance of eight miles. Some misapprehension has arisen as to the runs of the Norfolk and Eastern Counties Clubs, which are, however, separate organisations.

A Change in Surrey.

FOLLOWING the severe comments made by Lord Onslow at the Surrey Quarter Sessions at Kingston last October respecting the attitude of the Surrey police towards drivers of motor cars, more especially in the Reigate Petty Sessional Division, there was a cessation of hostilities for six months, and not a single case was brought before the Court. The truce apparently has now terminated, with the result that the season's first batch of offenders has appeared before the Reigate County Bench, as reported last week. Judging, however, from the evidence tendered in each case, the constabulary are not this year pursuing the peculiar practices which Lord Onslow condemned, and the magistrates, too, are more lenient, the heaviest fine inflicted being £3 and costs. It is to be hoped that a sensible attitude will prevail in the county this year, especially after the outspoken utterances of Mr. Walter Long and the triple prosecution of the Prime Minister.

The Glasgow to London Trial.

FROM a preliminary examination of the observers' reports made at the Automobile Club, London, after the run, it appears likely that the following vehicles will receive non-stop certificates:—No. 5.—10-h.p. Lanchester, entered by the Lanchester Engine Company; Nos. 8 and 9.—Four-cylinder Sunbeam cars, entered by John Marston, Limited; No. 19.—Arrol-Johnston dogcart, and No. 21.—Six seated Arrol-Johnston carriage, both entered by the Mo-Car Syndicate, Limited; No. 22.—10-h.p. Wolseley Tonneau, entered by Mr. Thomas Shaw; No. 23.—12-h.p. Argyll, entered by the Hozier Engineering Company, Limited. Also, subject to inquiry and determination on one point:—No. 1.—14 h.p. Chenard-Walcker Tonneau, entered by the Weston Motor Syndicate. The following made non-stop runs, but are subject to deduction of marks for delay in restarting at Leeds:—No. 11.—English-made six-seated double phaeton Gardner-Serpellet steam car, entered by Middleton and Townsend, for time occupied getting up steam; No. 3.—A motor bicycle, entered by the Quadrant Cycle Company, for time occupied in refilling petrol tank. These announcements are made provisionally, and are subject to alteration or modification on more minute examination of the observers' records.

Hill Climbing in Massachusetts.

THE Massachusetts Automobile Club opened the 1903 season on the 20th ult. with a hill-climbing speed contest on the Commonwealth Avenue Hill in Boston. The road is a broad, winding one, one-fifth of a mile in length, and with a maximum grade of 15 per cent. A steam car—a Stanley, driven by Mr. F. Durbin—carried off the honours, making by far the best time of the day, and winning both in its class and in the free-for-all race. Next came a Warwick motor-bicycle, a good second in the latter race, and a considerable distance in front of all the other petrol vehicles. Then came three Indian motor-bicycles, all making faster time than any of the petrol cars. Of the latter, the heavy and the light classes proved to be remarkably closely matched, the latter having a slight advantage in point of time. A Stevens-Duryea, in the under 2,000 lbs. class, climbed the hill in 43 1-5 sec., or just 1-5 sec. faster than a Peerless in the over 2,000 lbs. class. In the free-for-all race the two met again and exactly duplicated their

performances. The electric cars also showed up well. A Waverley made a record of 1.16 3-5. The following were the best times in each class:—

STEAM VEHICLES.		HORSE POWER.	TIME. MIN. SEC.
DRIVER.	CAR.		
F. Durbin	Stanley	5½	17
PETROL CARS UNDER 2,000 LBS.			
F. E. Randall	Stevens-Duryea	5	43½
PETROL CARS OVER 2,000 LBS.			
J. L. Snow	Peerless	16	43½
PETROL CARS WITH TONNEAU.			
J. L. Snow	Peerless	16	51½
ELECTRICAL CARS.			
W. G. Titcomb	Waverley	3	1 16½
MOTOR-BICYCLES.			
J. Downey	Warwick	1½	28
GRAND FINAL FREE-FOR-ALL CONTEST.			
F. Durbin	Stanley	5½	16½

The Motor Volunteers.

OFFICIAL news as to the doings of the Motor Volunteer Corps reaches us as follows:—The duty for General Oliphant, commanding the Home District, between the War Office and the Agricultural Hall, Islington, was carried out by Mr. Henry Edmunds on Thursday and Friday of last week. Captain Skeffington Smith, D.S.O., Adjutant of the Corps, conducted General Oliphant and staff to Caterham on an inspection of the barracks. On Friday, the 15th, Lieutenant-Colonel Mayhew, Commanding Officer of the Corps, drove General Lord Grenfell, G.C.B., etc., and staff to Gravesend for his inspection of the forts.

THE Earl of Onslow, the new Minister for Agriculture, is a keen motorist.

THE first motor-car exhibition held in Sweden was opened in the Idrottsparken, Stockholm, on Saturday last.

THE King is said to be contemplating a motor-car tour through Connaught during his visit to Ireland.

THE first four cars arriving at Leeds in the run from Glasgow to London were fitted with Clipper Continental tyres.

THE Calne Rural District Council has passed a resolution protesting against the proposed provision of a motor-car for the county surveyor of Wiltshire.

FOR striking a motorist on the face with a whip a Gunnersbury man has been fined £2 and costs at Brentford Police Court. Mr. Staplee Firth prosecuted.

RUMOUR has it that the business of Messrs. Panhard and Levassor is to be transferred to an English syndicate, negotiations with that object having been in progress in Paris.

IT is reported that the German Automobile Club has selected Baron de Caters, Mr. Foxhall Keene, and M. Hieronymous to represent Germany in the Gordon Bennett Cup race.

A SERIES of monthly auction sales is about to be established at Reading by the Speedwell Motor and Engineering Company, Limited. The first will take place on Wednesday next at the Reading Corn Exchange, and cars of several well-known makes are included in the catalogue.

KRUPKAR, LIMITED, the new concern referred to in a recent issue, have sent us a number of leaflets giving illustrations and brief particulars of their various types of cars. These range from a 6-h.p. two-seated car up to a 24-h.p. racer, and include tonneaus, phaetons, private omnibuses, delivery vans, lorries, etc. We hope to give some particulars of the new vehicles in a later issue.

LAST week reference was made to a run on a Benz-Parsifal car to Watford. The return journey was equally easy running, and even the wretched stretch of road at Cricklewood did not seriously upset our nerves. With a notable absence of vibration we came back to town negotiating through the busy traffic of a late afternoon in London with an ease that demonstrated the value of such a car for ordinary society purposes as well as for the more trying needs of touring.

The Glasgow to London Non-Stop Trial.

Photo by]

The Start from Leeds.

[Argent Archer.

HOW the cars came to town" might form a good epic for the modern Robert Browning anxious to parallel the fame of the poet's "Good News from Ghent." There is variety of incident in the scene, a demonstration of the moral attributes of persistence and courage, an illustration of the determination of the fair sex to steer their way without

inst., we wended our way towards Piccadilly to witness the arrival of the travellers from Glasgow, who, with the exception of a few hours' rest at Leeds, had been continuously in the saddle—or rather the bucket—for more than twenty hours. Such a performance indicates a fine determination on the part of the drivers, but what of the motor-cyclists, who straddled along with

Mr. Wilcox on the Baby Peugeot (No. 24.)

Mr. J. W. Stocks on the 10-h.p. De Dion (No. 20.)

the aid of mere man, and plenty of colour wherewith to paint a brilliant picture. And although the prevailing hues are those of drabcloth the combinations of the dust of half a dozen counties are sufficiently striking to ensure a vivid impression.

Towards the end of the afternoon of Thursday, the 14th

a lessening interest in the scenery of the fields and a growing eagerness to report themselves to Mr. R. J. Smith, the hon. sec. of the Western Section of the Scottish Automobile Club, to whose powers of organisation the success of the little jaunt was due? There may be fun about motor-cycling if the pastime is taken in moderation; but it must become monotonous if indulged

in on non-stop lines. What sighs must those riders have given in sympathy with the exhaust as they witnessed the social intercourse that is possible on a car, but quite foreign to the bicycle. A trailer would have been welcome to some of the men, and they would willingly have endured the added weight for the quiet companionship they would have enjoyed. When Yates appeared on his Humber his face told a tale of miles of weary travel and the strain associated with such a run. And Coles, the rider of the Brown machine, which was reported a trifle earlier, was quite as glad to tread the streets of the busy City again.

Yes, the busy City—for if all the world was not in Piccadilly his wife was represented. It was the hour when City men were going westward and Bond Street was emptying its carriage streams of fair ladies. And so the meeting in Piccadilly was representative of the wealth and work of the world. The humble tradesman, the patron of the penny 'bus, the client of

that ordinary people were breakfasting, the dust had been laid and the clouds ceased to unburden themselves. The route lay through Doncaster, Retford, and Newark, a canine in the second named place displaying antics that were fearsome to motorists and almost entirely self-sacrificing. Comparatively few people were met save at Newark, where market day was in progress, and the cavalcade of automobiles excited almost as much interest as did the procession of motor-vehicles on the historic 1,000 miles trial. At Stamford the police proved friendly, but there was a police trap in Huntingdonshire and at Norman Cross the boots of a seeming civilian betrayed the constable. "Can a leopard change his spots?" or a policeman alter the contour of his footgear? The experienced motorist answers both questions in the negative. At Barnet several motorists had gone out to meet the wayfarers, and a 40-h.p. Mercedes car attracted attention.

A Snapshot near Newark.

No. 10.—The 10-h.p. Argyll at Barnet.

No. 9.—The 12-h.p. Sunbeam at Hatfield.

The Lanchester (No. 4) at the End of the Run.

The Scene in Piccadilly.

Miss Dorothy Levitt, on the 12-h.p. Gladiator.

the cab, and the pedestrian who loves exercise, all joined in the welcome to the cars. From the windows of Clubland peered forth J.P.'s who regarded the obstruction to the traffic as a serious offence "in the eyes of the law," while the metropolitan police looked on as nonchalantly as is now their attitude towards motor-cars. The great crowd was thickest outside the headquarters of the Automobile Club, where gathered scores of motorists whose names are familiar in Society, legal, and engineering circles, while a few were there whose daring deeds have been duly chronicled in the long roll of victims which appears in the *Journal* every week. At the doors of the Club stood Mr. John Adam with his "Auld Lang Syne" welcome for the tourists who had escaped the moving dangers of the road in the shape of police and prejudice. The journey from Leeds had been somewhat uneventful. Rain fell in the morning, and the way out from the city was a greasy one. That was at 6 a.m. By the time

These were impressions gained among the motorists after they had notified their arrival in Piccadilly. The home-herald was Mr. C. Jarrott, who entered at 5.15 on a De Dietrich. Only a minute separated first and second, Mr. T. Shaw arriving on a 10-h.p. Wolseley. Then came a couple of motor-cycles, followed by Mr. Gutmann on the 14-h.p. Chenard-Walcker car. In quick succession came a Georges Richard, an Argyll with Mr. A. Govan at the helm, a Sunbeam, an Arrol-Johnston, a De Dion driven by Mr. J. W. Stocks, a F.A.C. tonneau, another Sunbeam, a Lanchester, a Gladiator driven by Miss Dorothy Levitt, whose white oilskin cloak stood out in the greyness of the afternoon, another Arrol-Johnston, a Wolseley with Mr. H. Prosser driving, another Georges Richard, an Argyll with Mr. F. Whitehead in command, a Rochet-Schneider driven by Captain Deasy, and an English Serpollet phaeton entered by Messrs Middleton and Townend. The motor-cycles—Brown, Quadrant,

and two Humbers—came along interspersed with the cars, and by half-past five eighteen cars and a quartette of cycles had arrived. Shortly before eight o'clock the Baby Peugeot strolled in, the progress of the sturdy infant having been delayed by punctures—equally the cause of dilatoriness in larger cars.

And so all the vehicles that left Leeds in the morning were accounted for. The drivers went their several ways, a few turning into the Club garage in Down Street, but many mingling with the fashionable crowd that rolled along Piccadilly with spotlessly-garmented footmen, who disdainfully gazed upon the motorists—wondering if ever they should be as those men were. Motoring is a ruffier of the attire, a tonic to the complexion, and a foe to folded arms. The statuesque attitude on the box seat of a brougham may be traditionally correct, but it can have no place on the motor-car. Liveried servants of the wealthy have already bidden farewell to the glories of wig and powder; they must soon relinquish the old habits on the box-seat and become as athletic and as equal to emergencies as is the man on the footboard.

One remark was overheard in the crowd. A well-attired gentleman asked the cause of all the pother and assemblage of people.

"Some motorists have come from Glasgow," was the response.

For a moment he contemplated a group of Argylls, Arrol-Johnstons, Wolseleys, Gladiators, and the like, and then, half whispering to himself, reflected, "Hum, I thought they were Scotchmen." Certainly there was much of the sturdiness of the Highlander and the dust of the Lowlands to be found on the cars as they came to town.

The Committee have sent us a preliminary statement with regard to the various vehicles, based on the reports of the honorary observers. Some of the matters referred to are still the subject of inquiry and consideration. The final report, together with the number of marks gained in each case, will shortly be issued.

1.—14-H.P. CHENARD AND WALCKER TONNEAU, entered by the Weston Motor Syndicate. The possibility of the deduction of one mark for this car for a driving stop is under the consideration of the Committee.

2.—12-H.P. GLADIATOR, entered by Miss Dorothy E. Levitt. Stop for puncture 20 minutes. Stop for battery run down, replaced by spare, 1½ minutes.

3.—24-H.P. DE DIETRICH, entered by Mr. Charles Jarrott. Stop owing to petrol not reaching carburettor, 7 minutes. Engine stopped momentarily when enquiring route, 1 minute. Stop owing to petrol not reaching carburettor, 2 minutes.

4.—10-H.P. LANCHESTER, entered by Lanchester Engine Co., Ltd. In reversing to return to rightward, broke reverse gear, and gave up between Skipton and Leeds.

5.—10-H.P. LANCHESTER, entered by Lanchester Engine Co., Ltd. Non-stop, full marks.

6.—10-H.P. WOLSELEY TONNEAU, entered by Messrs. Rennie and Prosser, Ltd.; ignition stop, 4 minutes.

8.—4 CYLINDER SUNBEAM CAR, entered by Messrs. John Marston, Limited; non-stop, full marks.

9.—4 CYLINDER SUNBEAM CAR, entered by Messrs. John Marston, Limited; non-stop, full marks.

10.—10-H.P. ARGYLL, entered by the Hozier Engineering Company, Limited; puncture stop, 15 minutes. Delay in re-starting engine at Leeds, 3 minutes.

11.—SIX SEATED DOUBLE PHAETON (GARDNER-SERPOLLET STEAM) entered by Messrs. Middleton and Townsend. Non-stop; six marks will be deducted for getting up steam at Leeds.

13.—THREE-CYLINDER BROOKE TONNEAU, entered by Messrs. Frank F. Wellington, Ltd., stopped for broken speed lever fork—45 minutes; and for 2½ hours to replace pump, and was withdrawn at Kendal. Report not yet received.

14.—9-H.P. ARGYLL, entered by Mr. Henry B. Hemmons. Car withdrawn during the trial. No records received.

15.—ROCHET-SCHNEIDER, entered by Captain H. H. P. Deasy. Driving stop, half a minute. Under consideration.

17.—12-H.P. GEORGES RICHARD LIGHT CAR, entered by Messrs. Mann and Overton's, Limited; tyre stop, 20 minutes; tyre pumped in Leeds, 2 minutes; two punctures, 24 minutes.

18.—24-H.P. GEORGES RICHARD LIGHT CAR, entered by Messrs. Mann and Overton's, Limited; one petrol tin containing water by mistake was emptied into tank and caused stoppage of 3 hours 12 minutes.

19.—ARROL-JOHNSTON DOG-CART, entered by Mo-Car Syndicate, Limited. Non-stop. Full marks.

20.—10-H.P. DE DION-BOULTON, entered by Mr. J. W. Stocks. Stop to fill tank, 2 minutes; stop to replace plug, 1 minute.

21.—6-SEATED ARROL-JOHNSTON CAR, entered by the Mo-Car Syndicate, Limited. Non-stop. Full marks.

22.—10-H.P. WOLSELEY TONNEAU, entered by Mr. Thomas Shaw; non-stop; full marks.

23.—12-H.P. ARGYLL, entered by the Hozier Engineering Company, Limited; non-stop; full marks.

24.—PEUGEOT, 2-SEATED, entered by Glasgow Motor Company; stop for ignition, 3 minutes; stop for ignition, 2 minutes; stop for ignition, 3 minutes; puncture, 15 minutes; replaced one trembler, 15 minutes; ignition, 1 minute.

25.—F. A. C. TONNEAU, entered by Farman Automobile Company, Limited; under consideration.

MOTOR-BICYCLES.

1.—MOTOR-BICYCLE, entered by the Triumph Cycle Company, Limited; did not arrive at Leeds; no records received from driver.

2.—MOTOR-BICYCLE, entered by the Triumph Cycle Company, Limited; wired from Kirkby Lonsdale "stuck"; no further driver's report received.

3.—MOTOR-BICYCLE, entered by the Quadrant Cycle Company, Limited; non-stop.

6.—MOTOR-BICYCLE, entered by Ariel Company, Limited; wired from Preston Station "Have abandoned run"; no further driver's report received.

7.—MOTOR-BICYCLE, entered by Brown Bros., Limited; filled tank twice; pushed up Shap Hill; pushed up hill near Kirkby Lonsdale; stopped to lubricate; stopped to replace belt three times; stopped to adjust trembler.

8.—MOTOR-BICYCLE, entered by Humber, Limited; stopped to fill with petrol five miles from Leeds and in Leeds; stopped near Biggleswade to fasten plug.

9.—MOTOR-BICYCLE, entered by Humber, Limited; stopped 15 minutes at Welwyn to clean out carburettor; stopped 2 minutes for loose terminal.

A COMPANY has just been formed in Florence, with a capital of £14,400, to be known as La Societa del Fabbrica d'Automobili Fiorentina.

WE recently had an opportunity of going over the motor-car body building works of Messrs. J. Rothschild and Fils, Limited, at Horseferry Road, Westminster, and Endell Street, Long Acre, W.C. The first-named premises cover a large area and are of the one-storey type. Here the bodies are made in the rough, every convenience being at hand for turning out any class of body. The plant is equipped even to the point of turning out the necessary iron fittings, such as lamp brackets, steps, dust hood, supports, etc. Aluminium is principally used in the construction of the Rothschild bodies, and we were much interested in the care given to the details. In the construction of an aluminium body thousands of small copper rivets are used, the holes for which have to be drilled and countersunk. The finishing of the carriage bodies is done at the Endell Street branch, and here we saw the various operations of painting, varnishing, upholstering, and general finishing and assembling, a separate department being devoted to each. The high finish of the Rothschild bodies is too well known to need enlarging upon at the present time; but, as indicating the variety of work undertaken, we may mention that at the time of our visit the work included bodies for Panhards, Clements, De Dietrich, Rochet-Schneider, Napier, C.G.V., and a 40-h.p. Mercedes.

At the annual meeting of the Roads Improvement Association the following addition to the resolution adopting the report was agreed to:—"The Association desire to record their sincere thanks for the able and indefatigable labours of their Honorary Secretary, Mr. W. Rees Jeffreys. During a year of very great pressure in business the work of the Association has grown enormously, and the prominence achieved in public matters by the Association has been largely due to the untiring energies of the Honorary Secretary. The accounts, which were submitted and passed, showed an income of £304 14s. 3d., and an expenditure of £208 13s. 6½d. The following were elected the Council for the ensuing year:—Messrs. J. R. Baillie, W. W. Beaumont, E. Cannan, Col. R. E. Crompton, W. H. Davey, J. S. Heslop, H. H. Humphreys, W. Rees Jeffreys, J. H. De Mattos, C. K. Mills, Hon. J. Scott Montagu, M.P., S. R. Noble, Joseph Pennell, E. Perman, H. R. Reynolds, M.A., Earl Russell, L.C.C., E. R. Shipton, W. G. Smyth, J.P., D.L., Hon. Arthur Stanley, M.P., Robert Todd, A. Webber, and G. H. Yelf. At a subsequent meeting of the Council the following officers were appointed:—Hon. Arthur Stanley, M.P., Vice-President; Mr. Robert Todd, Chairman; Mr. W. W. Beaumont, Vice-Chairman, and Mr. W. Rees Jeffreys, Honorary Secretary and Acting Honorary Treasurer.

MOTOR-CYCLING NEWS.

ONE of the last entries for the Paris-Madrid race before the list closed was a 3-h.p. Rex motor-bicycle by the Rex Motor Manufacturing Company, Ltd. Our illustration shows the actual machine selected for the race, it being one of the Rex Co.'s standard types. Mounted on it is Mr. G. Gordrey, of Coventry, who will ride the machine in the great event.

Mr. G. Gordrey on his "Rex" Motor Bicycle.

WE learn that one of the two Humber motor-bicycles entered for the Paris-Madrid race will be ridden by Mr. J. J. Leonard, who was for eight years with Werner Freres, of Paris, and who is perhaps the most experienced motor cyclist in this country. Mr. Leonard left for Paris early last week for a preliminary canter over the course.

ON Wednesday last week G. A. Barnes made a successful attempt on the hour motor-bicycle record from a standing start at the Canning Town track. From the 28th mile to the end of his journey he established new records. In the half-hour he rode 24½ miles, and at the end of the hour he had ridden 48 miles 1,395 yards. Barnes rode a "Bat."

THE Motor Cycling Club will meet to-day (Saturday) at the George Hotel, Harpenden, for tea at 5.30 p.m., and to-morrow (Sunday) at Hounslow Corner at 11.45 p.m. for a run to the Catherine Wheel, Henley, for lunch.

MOTOR-CYCLES are to be given their first official trial by the Austrian military authorities in the forthcoming manoeuvres. About twenty machines will be in use.

A MOTOR-CYCLE road race between Milan and Genoa, a distance of 215 kilometres, organised by the Italian Automobile Club, was run off on Sunday, the 10th inst. The winner proved to be Bucquet on the only Werner in the race.

SOME enthusiasts at Preston are proposing to form a motor cycling club for the town and district.

ON Saturday about 6,000 spectators attended the meet of the Glasgow Merchants C.C. (Ltd.), at Glasgow, when two motor-cycle events were decided, and H. Martin made an attempt on the Scottish one-mile record, which was 1 min. 19 sec. His new record was 1 min. 11 2-5 sec. This forms a British record. The former record stood at 1 min. 25 2-5 sec., made by Rigal. In the five-mile race Martin defeated Bert Yates, of Nottingham, winning in 6 min. 9 1-5 secs.—a British record. The result of the five mile motor-cycle race handicap was, 1st, C. F. Barden, London, scratch; 2nd, J. A.

Raper, Glasgow, 200 yards; 3rd, W. Deas, Glasgow, 600 yards. Time, 7 min. 25 sec.

THE Southampton County Motor Club had a very enjoyable run on Saturday last. Tea was taken at Andover. Unfortunately rain fell during the return journey. All got through, however, without the slightest mishap. To-day's run is to Chichester, via Swaythling, Westend, Botley, Titchfield, Fareham, Cosham, Havant and Emsworth, the return being by the same route.

THE Nightingale Cycle Club will hold a cycle sports meeting on the Putney Velodrome on Whit Monday. In addition to the ordinary events, such as motor and cycle racing, C. F. Barden and F. W. Chase will compete in three motor-cycle races of one, two, and five miles. In addition, Mlle. Jeanne Merveux will make her first appearance in England, and will give exhibitions on various types of motor bicycles, including a Parisian monstrosity of 20-h.p.

Mr. C. W. SCHAFER has been elected sub-captain of the Motor Cycling Club.

A HILL-CLIMBING contest took place on Saturday last at Central Avenue, Bangor, County Down. The length of the hill was 720 yards, and the gradient at its steepest part 1 in 12. Thirty-two entries were received, out of which only 12 faced the starters. The result was declared as follows:—S. Brady, 2½-h.p. Centaur, 52 3-5 sec.; T. Ireland, 2½-h.p. Humber, 60 4-5 sec.; T. Mallon, 3-h.p. Quadrant, 61 3-5 sec.; R. G. Wilkinson, 2-h.p. Triumph, 62 3-5 sec.

THE Hendee Manufacturing Company, Springfield, Mass., U.S.A., the makers of the Indian motor-bicycle, have brought out a snap-on wire terminal which obviates the need of nuts or looped ends to secure the wire to the sparking plug, which is in itself no small convenience and time saver. It is being fitted to all the new models of the Indian motor-bicycle.

MESSRS. VAN RADEN AND Co. are bringing out the new float-feed carburettor for motor-bicycles illustrated above. It is of novel construction, being made out of tube instead of one casting. The whole carburettor is extremely light, and can be taken to pieces by undoing only one nut. Adaptors are made to fit inside the carburettor to make them suitable for the different sizes of motors, the adaptors being made according to the cubical contents of the cylinder. One of the tubes at the same time forms a heating chamber.

THE IRISH FORTNIGHT.

AMONG the Irish motorists who will welcome their confreres from all parts of the world during the forthcoming Fortnight will be Mr. W. G. D. Goff, the chairman of the Irish Automobile Club, and also one of the founders of the A.C.G.B.I. He is a thorough sportsman, and since 1897 has been a keen automobilist, starting with a Beeston motor tricycle and subsequently owning a 6-h.p. Panhard,

a De Dion motor tricycle, a quadricycle, a 10-h.p. Panhard, and three Napier cars of 9, 12, and 16-h.p. respectively.

Mr. Goff graduated at Trinity College, Dublin, and was for a couple of years with the 2nd Dragoon Guards. As a yachts-

Goff on his 16-h.p. Napier, and was taken in the lovely grounds of Glenville, Waterford, where he resides.

THE Club enclosure on the Course will extend on both sides of the road opposite the point at which the race starts and finishes. Tickets will be issued at one guinea each, and a charge of another guinea will be made for admission to the Grand Stand. During the day a military band will help to beguile the time.

MESSRS. G. W. BACON AND Co., LTD., have issued a finely printed map of the Gordon Bennett Race Course. This is based on the latest Ordnance survey, and gives the starting and finishing points, controls, and other special information, together with a key map of the surrounding country. A system of colouring has been adopted to distinguish the course from the main roads, the latter being also coloured to avoid confusion with the subsidiary routes. The altitudes in feet above the sea level are

Photo by]

Mr. W. G. D. Goff on his 16-h.p. Napier.

[Croker, Waterford.

man he achieved distinction between 1883 and 1896 in Irish and British waters and has always taken a practical interest in shooting. On several important occasions he was a member of the Irish team in national competitions, including that for the "Elcho Shield." Now that he has identified himself with automobilism the same enthusiasm has been displayed in connection with the sport, and his organising ability no less than his popularity has been acknowledged in his election to the chairmanship of the Irish Club.

For many years a member of the board of the Dunlop Co., Mr. Goff, who is also a Justice of the Peace, has been enabled to watch the progress of the automobile industry from the days of the early prejudice to its present position of prominence and favour. He is also interested in local affairs and is an alderman of the city of Waterford. The cycle track which he had constructed in the People's Park at Waterford was a testimony to the concern he felt in the physical development of the people among whom he dwells. Our photograph shows Mr.

shown at intervals along the course. The key map of the surrounding country also includes the Belfast portion of the tour, and altogether Messrs. Bacon are to be congratulated on the work.

THE cars for the race will be weighed at Naas, which is twenty miles from Dublin, and less than half that distance from the nearest point of the course.

THE village of Kilcullen will practically resemble a camp during the first days of July, the exorbitant terms asked by some hotel proprietors having driven a good many motorists to canvas. During the next few weeks tents will be shipped to Dublin by several well-known London firms, and some interesting developments are likely to result. Surely it would be better for those who hope to make a good harvest during the Automobile Fortnight to exercise a little reason and not regard motorists as lambs to be fleeced,

ALREADY motorists are looking after guide-books to Ireland. That edited by Mr. R. T. Lang and published by Messrs. A. and C. Black is among the best, containing in a handy form for the pocket a general view of the whole of the country. It briefly indicates the leading monuments and buildings in the principal cities and hamlets of the country, while its descriptions of picturesque scenery are above the average of such literature. "The Sunny Side of Ireland" is the distinctive title of a book of two hundred pages, issued by Messrs. A. Thom and Co., Ltd., of Dublin. This is descriptive of the route of the Great Southern and Western Railway, a line which passes through some beautiful scenery, and which will be used by many to get to the course of the Gordon Bennett race. Its illustrations of the Killarney district are particularly good.

ROOMS have been engaged at Athy for a large number of employees of the Panhard-Levassor Company. Hamilton's Hotel will be the head-quarters of the party.

DURING the Irish Fortnight Messrs. J. Hutton, Sons and Co.'s garage will be open free of charge to all motorists from a distance. Prior intimation of a desire to take advantage of this

tion for all. A correspondent points out that Waterford, being a seaport in direct communication with New Milford daily by mail steamers of the Great Western Railway, and with Bristol bi-weekly, would probably be popular with many. There is a grand road from London to Bristol, where motorists could ship their cars direct to Waterford, in which town is situated one of the largest repair shops and garages in Ireland. There are several first-class hotels, and the town is beautifully located midway between the course and Cork, where the motor-launch trials are to take place during the automobile fortnight. The roads from this point to the course, as also to Cork, will compare favourably with any in Ireland.

New candidates for membership of the A.C.G.B.I., include the Earl of Clonmel, Capt. G. R. J. Hennessey, Capt. J. O'Neill-Power, and Mr. H. H. Smiley, of the Ulster Club, Belfast.

At Dundalk, petrol is obtainable from Mr. John Rea, Messrs. Williamson, and Mr. Pon Turner. The latter gentleman has a factory in Francis Street and repairs motor-cars. Ordinarily his stock of motor spirit is about 40 gallons, but, unlike other Irish

Photo by]

On the Gordon Bennett Course.—Ballyshannon Cross Roads.

[W. Lawrence, Dublin.

offer should be made to the firm at 115, Summer Hill, Dublin. They have just issued a useful map of the course, which they will send to all motoring applicants.

ALTHOUGH the West of Ireland is not included in the official itinerary, many motorists will make their way thither, and at Connemara and Achill will be delighted with many miles of grand picturesque lake and mountain scenery. The panoramic view of Killery Bay for eight miles, with its wild romantic mountains towering into the sky, and the volcanic-like "Mweelrea" (2688 feet) at the entrance; the wild grandeur of Kylemore Pass and Lake, with the "Twelve Pins," 2,000 feet, in the background; the silvery lakes Glendalough, Derryclare, Inagh, the sea cliffs and headlands of Clifden and Achill, washed by the broad Atlantic, are all points of beauty not to be omitted in any extended tour. All who contemplate visiting these scenes will find the officials of the Midland Great Western Railway of Ireland at Broadstone Station, Dublin, veritable encyclopedias on the subject.

As there is every appearance of a very large number of motor-cars going to Ireland for the Gordon Bennett race, it is quite possible that Dublin will be overtaxed to afford accommoda-

tion for all. he recognises how inadequate such a quantity will prove in July, and is arranging accordingly.

IN connection with the race, the Dublin and Glasgow Steam Packet Company, and the Glasgow, Dublin, and Londonderry Steam Packet Company, Ltd., have arranged with the Scottish Automobile Club to convey automobiles from Glasgow to Dublin at the rate of 45s. 10d. per ton, with a minimum of 47s. 3d. On the other side the rate for the conveyance of motor-cars over the Belfast and Northern Counties Railway will be 6d. per mile per car, station to station, with a maximum weight of 50 cwt., and a minimum charge of 7s. 6d. at owner's risk. An additional charge of 25 per cent. will be made when the cars are consigned at the company's risk.

MARYBOROUGH will be a point of vantage in connection with the race, and there are several convenient places in the locality from which to view the race, notably the Rock of Dunamase, Ballymacken Cross, Lator's Hill, the Limekiln, the street of the town of Stradbally, Bankers' Hill, and Meindy Gap. Maryborough and Stradbally have each accommodation for visitors, and we hear that it is still possible to obtain country cottages in the district on reasonable terms.

STREETS AND HIGHWAYS.

OUR article last week on the "Problems of Traffic" served to show the complexity of the subject, and the difficulties that will attend the solution of the matter. Diverse interests have arisen to claim precedence and consideration, and all these varying factors have to be conciliated before anything like general satisfaction with the condition of things results.

It is significant of the universal dissatisfaction now prevailing, that the two Labour members elected to the House of Commons during the present year should have already signalled their Parliamentary careers by the introduction of a Bill to provide for the regulation of traffic in towns. The preamble sets forth that the measure is drafted with a view to the better regulation of traffic in the streets, and for the prevention of accidents. The Bill would leave it optional to any local authority to adopt its provisions by simple resolution, and its main clause is as follows:—"Notwithstanding anything contained in the Highway Act, 1835, or in the Towns Police Clauses Act, 1847, no person shall act as the driver of, or have sole charge of more than one

recognising the importance of the road problem warrants our reiteration of the demand for a thorough and exhaustive inquiry into the whole subject.

The matter is not merely one for the better regulation of traffic in the streets of our great towns. There are country lanes and rural thoroughfares which require examination and thorough overhauling. According to the provisions of the Highways Act, 1835, any owner of land on which hedges or trees are growing adjoining any causeway may be summoned if his hedges or trees are not pruned or lopped in such a way that they cause no obstruction to the highway. As a matter of fact hedges have encumbered the pathway along miles of the countryside, and grass paths have been allowed to encroach upon the carriage-road in a way that the Act of 1835 never contemplated and was intended to prevent. Custom has allowed the practice to continue until few people now know the obligations of owners with regard to the matter. Hence the need for that comprehensive inquiry which seems eminently desirable. For instance, no tree or shrub may be planted within fifteen feet of the centre of the highway. Such is the law—more honoured in the breach than the observance. This matter of country roads has become

Mr. G. Higginbotham, of Macclesfield, on his 60-h.p. Mercedes.

cart or carriage drawn by one or more animals in any street, in the district of a public authority, and no person shall fasten, or allow to be fastened, to the rear of any such cart or carriage any other cart or carriage drawn by one or more animals, or any animal drawing a cart or carriage, and any person acting in contravention of this enactment shall be liable to a penalty not exceeding twenty shillings for each offence."

Apparently the Bill introduced by Mr. D. J. Shackleton, the M.P. for Darwen, and supported by Mr. W. Crooks, the new member for Woolwich, is intended to apply to horse drawn traffic only. Motorists would welcome any regulation tending to maintain good order on the highway; but here again, in this piecemeal legislation, we have a capital illustration of the point previously urged in these columns. A glance at this Bill reveals how inadequate are its provisions, taking no cognisance of the newer forms of locomotion, and being conceived in a somewhat narrow line of thought. But the fact that Labour men can unite with those of other political parties, like the Hon. J. Scott Montagu, M.P., Mr. Henry Norman, and the Irish members, in

imperative, and one of the most important benefits that the Gordon Bennett race will confer on Ireland is the object lesson that will be given along the course as to the clearing of obstructive corners, the cutting of hedges which absurdly hide the view of the roads in a locality, and the general "spring cleaning" of the highways. A similar tendency is necessary in many Devonshire parishes and elsewhere in Great Britain, and it would have the advantage of facilitating the new movement with which the interests of automobilists are identified. These considerations need scarcely be further urged; but, in view of the introduction of the forthcoming Government Bill dealing with automobilism, we trust they will be studied closely by all having influence with legislators and with administrators.

NOT all motorists travel too rapidly, for at a meeting of one of the Irish councils it has been stated that three motor-cars passing through Athy recently went so slowly that they kept in the way of an a.s.s cart.

THE FORCE MOTOR-BICYCLE.

HEREWITH we give an illustration of the new motor-bicycle, known as the "Force," which has lately been put on the market by the Woolliscroft Motor Company, Limited, of Coventry. The main point kept in view in the machine has been simplicity in design, with the idea of reducing cost of production to a minimum, consistent with reliability and efficiency. Endeavour has also been made to render control so easy that any ordinary cyclist can manipulate the machine on his first ride. The machine is of the loop frame type, a 2-h.p. motor being carried in a vertical position, low in the frame, so as to obviate sideslip and give greater tank capacity. Although the battery and coil are both fitted in compartments in the single tank employed, the petrol capacity is just over $1\frac{1}{2}$ gallons. The cylinder dimensions are 70 mm. by 70 mm., the engine developing 2-h.p. at a speed of 1,000 revolutions per minute. Simplicity of control is obtained by connecting a switch arrangement to the handle-bar lever, which also actuates the exhaust valve lifter, thus the movement of two fingers of the right hand is sufficient to at all times control the engine, while the objectionable exhaust-box explosions which sometimes follow the lifting of the exhaust valve are rendered impossible, as one cannot raise the exhaust valve without at the same time interrupting the electrical circuit. The attachment of the motor to the frame is by means of a strong hinge lug in the bottom of the loop, and the vertical position is normally maintained by means of a pair of clamp plates which firmly tie the crank case to the bottom bracket and the front portion of the loop respectively. When the bolts holding these clamp plates are slackened, the

1.—The Force motor-bicycle. The driving pulley is dismantled to show the reduction gear.

latter, being each slotted at one end, may be detached hookwise from the frame lugs, thus rendering it possible to swing the engine sideways to an angle which facilitates access to the valve chamber, etc. A novel driving gear system is employed, which it is claimed presents an unique combination of advantages. The belt pulley is not, as usual, fitted to the crank shaft, but its place is taken by a small steel pinion. This in turn meshes with a toothed wheel twice its diameter, the latter being securely fastened to the interior of a belt pulley double the size of those generally

used to obtain a corresponding ratio of gear. The advantage claimed for the arrangement is that it more than doubles the grip between belt and pulley. The belt pulley is centred on a stud carried by an adjustable quadrant, which is provided with a milled headed screw, rendering the tightening of the belt a similar operation to that performed in tightening the chain on an ordinary bicycle. The automatic carburettor used in connection with the machine, shown in Figs. 2 and 3, is claimed to give a perfect working mixture for any engine speed. This is effected by setting the discs EE to give sufficient air for a good reliable starting mixture. The supplementary air valve G remains closed until the engine attains a certain speed, when it

Figs. 2 and 3—Vertical elevation and section of Force carburettor.

E E, air regulating discs.
F, mixture outlet to cylinder.
G, supplementary air valve.

commences to open, admitting an increasing proportion of air to the mixture as the engine speed rises; thus it obviates the necessity for the rider to interfere with the carburettor, while it renders a carburettor lever on the frame tube unnecessary, the only lever so furnished being that which advances or retards the ignition. The petrol enters by the pipe A, and on the suction stroke of the motor the valve C is lifted against the action of the spring D, spirit being drawn in past the needle valve B. As regards the lubrication, a small compartment is partitioned off at the forward end of the tank. Underneath this compartment is a small transparent lubricator, which is filled by a movement of a small lever on the top of the tank, and within easy reach of the rider. A reversal of this lever cuts off the supply from the tank, and at the same time opens the connection to the crank case, whence it is rapidly drawn by the suction of the piston.

THE United Metal Industries, of Masshouse Lane, Birmingham, have sent us a copy of their illustrated price list, which comprises acetylene, paraffin, and electric lamps, the "W" motor-car chains, lubricators, coils, and a variety of motor-car accessories.

THE British Consul at Buenos Ayres reports that only twenty-eight automobiles were imported there last year, but the appreciation of them is increasing, and a demand, no doubt, will shortly arise.

GENERAL OLIPHANT, commanding the Home District, 4th Army Corps, has applied for the use of motor volunteer cars, one car per day, from May 12th to May 30th. Capt. Schlosser, Signalling Officer, Eastern District, 4th Army Corps, has applied for the use of a motor volunteer car for his long-distance signalling operations during the Whitsuntide holidays.

CONTINENTAL NOTES.

BY "AUTOMAN."

THERE is nothing for automobilists to talk about just now but the great International Competition from Paris to Madrid. On Friday, May 15th, at 6 o'clock in the evening, the entries were definitely closed, the last entry being M. Rudolf Darzens, of the Paris morning paper *Le Journal*, who no doubt in starting last proposes to pick up the news of the road in the most satisfactory and complete manner. M. Darzens has the No. 314.

THE total entries thus reach the record figure of 314, but thirty-nine have cancelled their engagements or have been disqualified for various reasons, leaving 275 competitors, divided into 112 heavy cars, sixty-four light cars, forty voiturettes, and fifty-nine motor-cycles. The list for the Paris-Vienna contest of last year totalled 205 cars and cycles, of which number 137 started. There will probably be a much greater proportion of starters this year. The English competitors comprise Messrs. C.

of the Republic, who walked over from the Elysee to see the event. Forty-seven cars will attempt the whole journey, and six more will join the caravan at the frontier. The total number of passengers carried is 180.

THE whole of this week has been spent in the final preparations for the Racing Section, and in front of the Automobile Club, and around the gates of the Tuileries Gardens, there have been large crowds from morning to night, watching the arrivals of racing cars. The first of the racing Mercedes cars was brought into France by Baron De Caters, and it very much resembles the 60-h.p. type, with this difference, that the driver is seated over the back axle, with his steering gear much more inclined. The engine is said to give a little more than 90-h.p., and is a four-cylinder of the well-known Mercedes type.

I SAW one of the racing Panhard and Levassors last Sunday, crossing the bridge of Suresnes. The engine is reported to give 80-h.p. The single spring over the front axle has been abandoned this year, as also the frame of armoured wood, which has been

Mr. Henry Farman and his 80-h.p. Panhard Paris-Madrid Racer.

Jarrott (De Dietrich), H. R. Kirk (Napier), S. Girling (Wolseley), Hon. C. S. Rolls (Panhard), E. H. Arnott (Werner), S. F. Edge (Napier), Mark Mayhew (Napier), H. Austin (Wolseley), J. A. Holder, F. Jackson (Eagle), L. Porter (Wolseley), Lord Carnarvon, A. Du Cros, Harvey Foster (Wolseley), J. Ball and J. J. Leonard (Humber motor cycles), C. W. Hacking, S. Bowkett, and A. C. Wright (Ormonde motor bicycles), and G. Gordrey (Rex motor-bicycle). The weighing-in of the cars for the race was commenced on Tuesday, seventy-five being scaled. A 50-h.p. Wolseley machine attracted a good deal of attention from the spectators. As already announced, the start takes place early on Sunday morning.

By the time that these notes appear in print, the Tourists' section of the race will be crossing the frontier on the way to Madrid. They started on Wednesday, May 13th, under blue sky and bright sunshine, on their fourteen days' trip across a most interesting and picturesque country. Amongst the distinguished people who went to witness the start was the President

replaced by stamped steel, so successfully inaugurated in the Mercedes car. The Panhard car is much similar to last year's type, but the radiator is a sort of compromise between the honeycomb and the old style. The inlet and exhaust valves are mechanically actuated, and there are three speeds and reverse. The motor is not parallel with the ground, but the front end is slightly dropped, so that the fly wheel may be raised from the ground. The change of speed gear and clutch shaft are also inclined in consequence. There is no silencer, or rather the silencer has been replaced by a simple exhaust pipe, and, notwithstanding this, the car makes little or no noise.

I WAS fortunate enough to have the opportunity to assist at the first trial of the Hotchkiss car, which, like the Panhard, has its silencer replaced by a simple exhaust pipe, and which is also very silent, and runs with a smoothness similar to the car of last year. The great feature of the Hotchkiss car is the cardan drive, which works with perfect smoothness, and is said to be as supple as the chain drive.

In the Hotchkiss car the throttle has been entirely discarded in favour of the variable lift of the inlet valve, which not only enables the engine to be started easily, but allows the speed of the engine to be varied from 100 revolutions to its maximum speed under conditions of perfect economy, and leaving the action of the carburettor to be perfectly regular and to need no adjustment. The front axle and steering wheels are entirely novel, and combine great strength with perfect steering, as a

The Paris-Madrid Race, Tourist Section. A Snapshot at Lunch Time.

line dropped perpendicularly from the centre of the so-called pivot on which the front wheel turns reaches the ground directly in the centre of the tyre.

THE chief feature of the new Mors car is the wind shield with which it is covered, which makes it look like an inverted boat. The engine, which is said to give 80-h.p., has steel cylinders, and is all in one piece. It had been the intention of the Mors firm to supply the motor with mechanically-driven inlet valves.

The Route of the Paris-Madrid Race.

However, for want of time, or for other reasons, this disposition was abandoned at the last moment, and the inlet valve of the motor is automatic, and is placed in the centre of the top of the cylinder.

THE Rhenish Automobile Club held a 100-kilometre race from Mannheim to Baden-Baden on the 10th inst. In the

general classification Herr H. Opel, on a 20-h.p. Opel car, was first in 2 hrs. 14 min., and Herr Jean Ruhl second, on a 12-h.p. Benz-Parsifal in 2 hrs. 17 min.

A HILL-CLIMBING competition over a kilometre course is to be held at Perigueux, France, on the 1st June, under the rules of the A.C.F. Eight classes, ranging from motor-cycles to heavy cars, are provided for in the programme.

AMON: the latest additions to the list of competitors in the Circuit des Ardennes is that of the Star racer entered by Mr. C. Cordingley. The vehicle will be driven by Mr. J. Lisle.

THE automobile clubs of Antwerp and Flanders are organising an automobile week to be held at Ostend, from July 12 to the 19th. The programme is as follows:—July 12th, 100 kilometre race for racing cars; July 13th, 100 kilometre race for touring cars; July 14th, mile and kilometre contests for racers; July 15th, mile and kilometre races for touring cars; July 16th, motor-cycle races; July 17th, "Concours d'Elegance" and flower fete; July 18th and 19th, short tours in the district.

THE Circuit National of Belgium came to an end on the 14th inst. Included in the programme was a kilometre speed contest (flying start) at Namur, the winner in the car section being Baron de Crawhez, whose time on a 10-h.p. Panhard was 1 min. 16½ sec. M. Elskamp, on a 2½-h.p. Minerva, was the winner in the motor-cycle section, his time being 1 min. 3 sec. A hill-climbing competition over a course 2½ kilometres long, was also held. In the car section, the winner was M. Langlois, who, on a 20-h.p. Vivinus covered the hill in 4 min. 36½ sec., while M. Flamand, on a 2½-h.p. Minerva, made the best time not only in the motor cycles section but of the day, doing the climb in 4 min. 9½ sec.

MESSRS. GROSE, LIMITED, have opened the Central Motor Garage at Pike Lane, Marefair, Northampton.

At a meeting of the Association of Chief Constables in London a general feeling was expressed in favour of all motor-cars being numbered, and in addition bearing the name of the district or division in which the owner resides. These numbers and names to be painted conspicuously on the cars, and to be illuminated at night. This plan would involve some kind of registration. A committee was appointed to draw up a scheme on the subject for submission to the Home Secretary.

A MAP of England and Wales, showing those places where main batteries for electric automobiles and ignition cells for petrol cars may be recharged, and a directory of central stations and private premises where such facilities can be obtained, is in course of preparation by the "Electrical Times," 8, Bream's Buildings, Chancery Lane, E.C. The editor of our contemporary will be pleased to hear from readers who have charging facilities, or who know where they can be secured either in London or the provinces. Information is wanted as to the source of supply and maximum voltage and current available, as well as the charge for current per unit or per cell, and any facilities for garage and repairs. Particulars should reach our contemporary not later than the second week in June.

THE laughter aroused by the experiences of an Irish R.M. is likely to be continued by Messrs. E. A. Somerville and Martin Ross in their sketches, "All on the Irish Shore," in which the eccentricities of horses, men and women are hit off with a quaintness that is of the soil. The book has been created in an atmosphere of native humour and observation, and those who would fain appreciate the character of the rural districts of Ireland will find a good introduction in this volume of stories which Messrs. Longmans, Green and Company have published. In only one story has the motor-car been introduced, and that to chase a piebald dog that had had a dolorous existence, but never such an awful experience as when the "Bollée" followed behind. That, however, is incidental; the stories are of horses, and "Fanny Fitz's Gamble" is certainly the best of a bunch of typical Irish tales.

HERE AND THERE.

A HULL Motor Club is in course of formation.

THE May Day parades of heavy motor-vehicles will, in future, be organised by the A.C.G.B.I.

WE have for some time known the Westminster Motor Car Garage by name, but only recently have we become aware of the extent of the premises of this firm. They are capable of containing about fifty cars, but their position in Kensington Place, off Page Street, Westminster, is somewhat difficult to find

Mr. L. Savory, of the Westminster Motor-Car Garage, on his 20-h.p. M.M.C. Car.

for the first time. Well-equipped workshops and stores with a capable staff of mechanics are also available, so urgent repairs can be effected at all times, while the charging and maintenance of electric vehicles is undertaken, a special plant having been put down for this purpose.

THE Ariel Motor Company, Limited, have secured an order from the Water Committee of Birmingham for a 16-h.p. car for the use of the Water Department's engineer upon the Welsh water scheme.

THE Belfast Trade and Labour Council has passed a resolution requesting the Corporation to introduce a clause into the proposed Belfast Tramway Bill for the purpose of obtaining powers to run motor'buses in the city for the convenience of workmen.

SEVERAL hundred persons congregated outside the Great White Horse Hotel, Ipswich, the other afternoon, attracted by two motor-cars which stood at the door of the well-known hostelry. The cars were owned by Mr. H. S. Holden, of Easthampstead Park, Wokingham, who, having been on a tour through the country, was on his way back to London.

IN opposing the scheme for a rail-less trolley car service in the Stroud and Cheltenham district, Sir J. Wilkinson, the general Manager of the Great Western Railway, stated recently to a select committee of the House of Commons that the Great Western had experimented with a petrol engine, but it had not been a success. They had decided to try a service of steam-motor-cars between Chalford and Stonehouse, and he had approached the Board of Trade on the matter.

MESSRS. LAURIE AND MARNER, the well-known carriage builders, have just completed a petrol motor-omnibus intended for a public service about to be started at Aalesund, Norway. The chassis is a 12-h.p. two-cylinder Vincke-Halcrow, having four speeds forward and one reverse, the transmission being on the Panhard system. A novel feature of the vehicle is the division of the body into two separate compartments, first-class passengers being in the front and entering from the side and the third from the rear. The 'bus, which is built to carry about fourteen to fifteen persons, runs on 3 in. solid rubber tyres.

THE 1904 Nice week is to be held from the 20th to the 28th March.

TENDERS for a motor steam fire engine will be received by the Beckenham (Kent) Urban District Council up to Monday, the 1st prox.

A SUB-COMMITTEE of the East Sussex County Council is considering an application from the Chief Constable to provide a motor-car for his use.

THE petrol motor-omnibus running between Lewisham, Lee Green, and Eltham appears to be well patronised. We saw the vehicle on Tuesday, and were much struck with the quiet running of the engine when the 'bus was standing.

CALLING in at Messrs. Thrupp and Maberly's carriage building establishment the other day we had an opportunity of inspecting the handsome private omnibus body they have just fitted to the chassis of a 28-h.p. Mercedes for Mr. S. B. Joel.

A PUBLIC motor-car goods service from Stockingford into Birmingham is projected. A private haulage syndicate is said to be responsible for this enterprise, and there will probably be an early meeting of the Nuneaton and Coleshill branches of the Warwickshire Farmers' Association in support of the enterprise.

MR. JAMES WILSON, of the Elswick Cycle Company, who left Edinburgh at midnight on the 11th on a non-stop run to London in his motor-car, arrived in London on the 12th at 5.55 p.m. Mr. Wilson left London on Wednesday for Land's End, with the view of doing the journey from there to John o' Groat's.

THE Birmingham Aluminium Casting (1903) Company, Limited, has been registered on 5th May, with a capital of £46,000, to acquire the assets and undertaking of the Birmingham Aluminium Casting Company, Limited (now in liquidation), and to adopt an agreement between the said old company and Mr. T. T. Curtis.

THE accompanying illustration shows the first of a fleet of motor-omnibuses Stirling's Motor Carriages, Limited, are building to run from Johannesburg to Auckland Park, an estate about three miles to the north-west of Johannesburg. This car is fitted with a four-cylinder motor developing 24-h.p. An important feature is the water-cooling arrangement, in which the usual water circulating pump is dispensed with. A combined water-tank and radiator fitted on the front of the vehicle and forming a dash

board contains about ten gallons of water, which is capable of keeping the 24-h.p. engine perfectly cool. On a 100 miles trial last Saturday in the hilly country in the South of Scotland the vehicle, loaded with 30 cwt. of pig-iron, made an excellent performance. The low speed was never once used, most of the hills being mounted on the top gear, and only once was the intermediate speed used. The omnibus has seating capacity for fifteen passengers and driver. It is fitted with solid rubber tyres and its weight ready for the road is 38 cwt.

OSTEND is to have an "automobile week" from July 12th to the 19th.

THE Swiss Automobile Club held a kilometre race near Geneva on Monday last, the best time being 39 3-5 sec.

L'AUTOMOBILE CLUB FOREZIEN, of St. Etienne, will hold a hill-climbing competition from Belle Vue to Bourg-Argental on Sunday next.

TO-DAY (Saturday), the Scottish Automobile Club will hold a hill-climbing competition on Kirkfield Hill, Lanark, over a course measuring 701½ yards, and having an average gradient of 1 in 9.

THE Lanchester American Patents Syndicate, Limited, has been registered to acquire the American patents for and rights in certain inventions by Mr. F. W. Lanchester, relating to mechanically-propelled vehicles. The first directors are Messrs. F. W. Lanchester, A. Whitfield, and J. V. Pugh.

THE second of a series of five monthly club runs of the Reading Automobile Club for a challenge cup took place on Wednesday, last week, starting from Friar Street, Reading. The route was *via* Odiham and Alton to Farnham (where tea was taken at the Bush Hotel), and the return *via* Aldershot, Farnborough, Yateley, Eversley and Arborfield.

Jackson Tourist Car Mounting a Hill at Syracuse, U.S.A., which has a Gradient of 18 per cent.

IN connection with Lord Iveagh's scheme of improved transit in Ireland, a motor-car service will probably be established between Athea, Knocknagoshel, Brosna, and other villages which are now between five and seven miles from any railway station.

A DOCTOR who six months ago bought an Albion car through Mr. John Love, of Kirkcaldy, has been giving his testimony to the value of the automobile to a Scotch press representative. He says the upkeep of a motor-car is cheaper than the cost of a horse carriage. A rope-starter is fitted to the car, so that the engine can be stopped while the doctor is visiting his patient, and started from the seat by the driver.

MESSRS. JONES AND Co., of Talbot House, Lichfield, write that they are in a position to supply wholesale "Matchless" motor spirit of about 700 s.g. at 9½d. per gallon, ex store Birkenhead, in free barrels. The railway companies will only carry ton lots, and from station to station, but this difficulty could be got over if two or three buyers in a town purchased together the necessary six or seven barrels. Messrs. Jones also point out that a less quantity could be ordered and the carriage paid on a ton. The value of the free barrels would be about equal to the carriage.

M. DE COSMOS is reported to have made a kilometre in 24 sec. on a 40-h.p. car on the Vise road, near Liege.

THE Motor Cycling Club have decided to hold their first 200 miles Reliability Trial for the S. F. Edge Trophy on Saturday, June 27th.

THE Midland Automobile Club will have a club run to Stratford-on-Avon to-day (Saturday). The head quarters will be at the Shakespere Hotel.

THE Champion Motor-Cycle Company have opened premises at 136, Leeds Road, Bradford, for the supply of petrol, spare parts, etc., and for the repair of motor-cycles.

THE London Motor Engineering Company, Limited, of 87A, Wellesley Road, Kew Bridge, is prepared to find accommodation for about fifteen cars.

FOR leaving a horse and cart unattended, outside the Crown Inn, at Nutley, on the 23rd of April, A. L. Brooker has been cautioned by the Basingstoke Bench and discharged on payment of the costs, 4s.

THE Blackpool Motor Garage Company are about to open a large new garage in Rigby Road, Blackpool. It will be equipped for repair work of all kinds and a stock of petroleum spirit and accessories will be kept.

MR. EDGAR SMITH, of Halifax, has taken large premises off Northgate, in that town, for a motor garage, where he will store about a dozen cars. Repairs will also be undertaken. Mr. Smith has been appointed sole agent for Halifax and district for the Darracq and Ariel cars.

"THE Lubrication of Motor-cars, Vehicles, and Cycles" is the title of a booklet which has been sent us by Messrs. J. R. Grindon and Sons, oil merchants, of Bristol. It gives particulars of their various "Temple" motor lubricants and greases, while a number of useful hints on motor-cars are given at the end.

EARLY next month the premises at 19, Otago Street, Great Western Road, Glasgow, at present occupied by a firm of carriage hirers, will be opened as a motor-car garage by Mr. E. M. Blakely. There will be accommodation for from forty to fifty cars, and provision will be made for executing repairs and supplying all motor requisites.

THE Continental Caoutchouc and Guttapercha Company have just issued a little book containing most exhaustive instructions for the manipulation of Continental motor tyres, hints on the best way of prolonging their life, treatment of wear and tear, the repair of punctures and other damages, etc. All users of pneumatic tyres on motor vehicles should obtain a copy of the booklet, which will be found extremely useful in many ways.

THE other day Mr. Brook-Shaw, of the Sheffield Automobile Club, left that city by the 4 a.m. Midland express for London, which was reached soon after half-past seven. Leaving on a 10-h.p. Gladiator, he returned via Barnet and ran without a stop to Buckden (61 miles). Whilst travelling slowly through the village he was stopped by the inevitable policeman, and then proceeded to Grantham (110 miles), where a halt of half an hour was made for luncheon, thence by Newark and Retford to Sheffield, which was reached at 10.30 p.m. A quart of lubricating oil was used and 5½ gallons of Pratt's motor spirit consumed, so that the cost of running 170 miles works out to 9s. 8d.

THE Hele-Shaw Patent Clutch Company, Limited, has been registered with a capital of £50,000 to acquire the business of engineers and patentees now carried on at Pembroke Place, Liverpool, under the style of the Imperial Engineering Company, to acquire certain patents and rights relating to friction clutches and brakes, and applications thereof; to adopt an agreement with Messrs. H. S. Hele-Shaw and J. E. Jose; and to carry on the business of mechanical engineers, etc. The first directors are Messrs. H. S. Hele-Shaw, J. E. Jose, and T. T. Vernon, each of whom may retain office for life.

CORRESPONDENCE.

THE KREBS CARBURETTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It seems to be generally believed that the new Panhard carburettor is the first attempt to automatically regulate the mixture at all speeds. A booklet published giving particulars and sketches of it states that Mercedes, Georges Richard, Crouan, and others have experimented in this direction, but unsuccessfully, owing to the fact of these people trying to regulate it by the governor. This booklet states that "all other inventors have adopted this (the governor regulation) for want of a better one." This implies that none but Commandant Krebs have tackled direct control of supplementary air by suction controlling a diaphragm or similar device. I find, however, that Bernardi in 1886 invented a carburettor in which a valve opens more or less on the mixture pipe by the suck of the engine, and so varies the mixture at different speeds as required. In 1887, Haddon automatically regulated the auxiliary air by the speed of the engine causing more or less vacuum and drawing round a rotary valve, thus disclosing suitable ports by means of which pure air diluted the mixture. In 1897, Boulton described a carburettor in which an adjustable suction

for the movement generally if these people would be content with a moderate speed, and would see that more precaution was used while driving. Maybe there is pleasure in running a racing machine that will rip along at the rate of forty to fifty miles an hour, or more, and while you are rapidly turning a bend in the road see a horse scared into fits or some pedestrian making high leaps for a place of safety, but I believe if the gentleman who was "at the wheel" was occupying the place of the flying pedestrian there would be some hard feelings on his side. How much more pleasure there is in letting your car hum along at a moderate pace, say fifteen or twenty miles an hour, while in the country, and enjoying the scenery as you go, than to rush along at top speed leaving a trail of dust behind.—Yours truly,

MODERATUM.

FRICITION TRANSMISSION GEAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was interested in the letter on the above subject in your issue of the 9th inst., and beg to state that it is quite possible to make a very efficient gear of this type if properly designed. I have been experimenting and have produced a car fitted with frictional transmission, giving very good results. The car I have on the road has an 8-h.p. engine, and weighs 18½ cwt.

M. Baras, on the 30 h.p. Darracq Light Racer he will drive in the Paris-Madrid Race.

[*La France Automobile*.]

diaphragm allowed supplementary air to be drawn into the mixture as the speed increased. In 1900, Mills patented a device in which a cone, controlled by a light spring, is placed in the carburettor and the suction increase, or *vice versa*, adjusts the air and petrol mixture automatically. None of these experiments appear to have carried out the idea exactly as done by Krebs, but the method adopted by him appears to vary more in detail than in principle, and I think it is quite feasible to control the supplementary air entirely automatically in several ways that shall give results quite as correct as a flexible diaphragm.—Yours truly,

A. E. S. CRAIG.

MODERATION WANTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—While, as a motorist, I am willing to make every allowance in favour of those who use motor-cars, it cannot be denied that there are a great number of automobilists who do not use the roads with a due regard to the comfort and convenience of others, and, unfortunately, these create a prejudice against automobilism to such an extent that it would not be surprising if restrictions were imposed upon the many in consequence of the action of the few. It would seem that the main desire of many wealthy motorists is to get a record-breaking car which will tear along the public highways, striking terror to the people's hearts. It would be much better

unloaded; I have taken five people in it up hills 1 in 10 at six miles per hour, and over twenty miles per hour on the level with solid tyres. The car has now run over 2,000 miles, using less than one gallon of petrol per twenty-five miles. I think you will agree with me that this is not very inefficient considering the weight and the tyres used. The new cars I am making will be very much lighter and have many improvements introduced. The gear is quite different to other friction gears I have seen or heard about. I write this merely to tell you that friction gears are not so hopeless as some people make out, and they possess many advantages over other gears.—Yours truly,

W. F. THOMAS, A.M.I.M.E.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Re Balladeur's letter on "Friction Transmission Gear," I first saw a friction driven car at an Exhibition and although dubious of the method, was agreeably surprised at the ease of running, silence of drive, and hill-climbing capacity of a comparatively small-powered car which I tried. We climbed all the hills around the district wonderfully well. After this, I again tried the car at the Agricultural Hall, where my previous favourable opinions were thoroughly confirmed.

I do not know of Le Pape's experiments, but it is quite evident that this idea works.

When running in and around the yard of the Agricultural Hall, the silence of the friction gear was so remarkable in comparison to other cars around, that I am certainly going to have my present car altered by the English makers. There were other points about the car which agreeably surprised me, viz., the splendid and simple way of obtaining the make and break of the magneto ignition, the thermo syphon cooling, the unbroken back live axle,

As to friction not sufficiently transmitting power, I personally know of machinery (heavy) which has been friction driven for twenty years satisfactorily, and friction-actuated cranes lifting up to 3 tons.—Yours truly,

GEAR BOX.

PRIVATE MOTOR-CAR STABLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of the 25th ult. you speak of suitable motor-sheds, so I am sending you a photo of mine. It is built of 1½ in. flooring—walls

and roof. The walls are covered with rustic wood, and the roof thatched with broom; it is thoroughly tight and dry. In hard frost I keep an oil stove near the door to prevent the water-cooler of my car from freezing.—Yours truly,

WALTER CREBER.

DANGEROUS EXHAUST GASES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was glad to see the "Useful Note" in a recent issue regarding dangerous exhaust gases and the necessity of ample ventilation in motor stables, for, having had the nasty experience of being almost asphyxiated by the inhalation of exhaust vapours, I am well aware of their dangers. The engine in my touring car was running rather badly and giving off a thin blue vapour, smarting to the eyes but not disagreeable to the throat or lungs. I stood over the car seven or eight minutes regulating the admission of petrol and then feeling a ringing in my head started to leave the motor house, which, by the way, is almost air-tight and heated, to seek a soft lounge in my library. The next thing I knew was that my face was wet and that a voice far, far away said, "Take a deep breath." I took the deep breath and also a resolve that I should do what I could to warn my motoring friends against this danger.—Yours truly,

FIELDMOUSE.

IDENTIFICATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a young motorist and a medical man I cannot see what objection can be taken to the name and address being plainly painted on the "off side" of a car. If this were done "scorchers" only would have anything to fear, and surely no motorist is ashamed of his name. If such object then let him pay a higher tax for some special plain signification. I pay tax on one motor-car, also for one carriage and on my professional dogcart. I have my name and address painted so as to avoid taxation, and am not ashamed to do so.—Yours truly,

"MEDICAL MAN."

HIGH-SPEED TREMBLER COILS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—So far as my experience goes I think one who is "tired of adjusting the trembler" need not discard his non-trembling coil and De Dion contact breaker. I have a small car with a 4½-h.p. De Dion engine. The necessity for adjusting the trembler occurred so frequently that I was on the

point of fitting a wipe contact and trembling coil. Some two or three months ago, however, Messrs. Geipel and Lange placed the Auto-trembler on the English market. I saw that this was what I wanted. I introduced one in the primary circuit of my non-trembling coil and screwed up the platinum screw of the De Dion contact breaker to give a positive contact. Since doing so I can start the engine at once, practically without fail, with the first fall of the "trembler" into the notch of the cam; I never have a miss-fire unless by chance I use too poor a mixture; I very rarely require to adjust the contact. I cleaned the platinum points yesterday for the first time for a month, and I get as much power from the engine as on the fortunate days when I obtained perfect adjustment of the trembler, in the old style.—Yours truly,

ONE WHO HAS ADJUSTED THE TREMBLER.

[Several other correspondents have written recommending the Auto-Trembler.—Ed. M.-C. J.]

THE QUARTERLY 100-MILES TRIAL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. de Wilton states that he did not suggest that the car should have been driven faster. Why, then, did he emphasise in his foot-note that the car was driven "very slowly," seeing that the legal limit was practically maintained all through?

With regard to the right or otherwise of stopping the engine when gravity would propel the car down any hill, this question has since been decided by the Automobile Club. The Committee has come to the decision that, as in France, providing the car itself does not stop, the driver is perfectly entitled to take every advantage of gravity that he can. As already stated, this in no wise compensates for the extra fuel consumed in ascending hills, by at least 30 to 40 per cent. Furthermore, I beg to say that it was admitted to Mr. de Wilton, at the time of the run, that the engine was being stopped when descending hills, similarly as done in French consumption trials.

With regard to Mr. de Wilton's statement that "the engine was stopped for at least 25 per cent. of the run," I challenge Mr. de Wilton to cover twenty-five miles of the official hundred-mile route covered on the occasion of the Quarterly Trial by means of gravity and with his engine stopped, subject to his keeping within the legal limit. With all due respect to Mr. de Wilton, I cannot help contending that the suggestion is an exaggeration or inaccuracy, for anybody acquainted with the official 100-mile route is aware that there is certainly nothing like twenty-five miles of down hill in the whole run. The fact of the matter is that the Chenard and Walcker engine is so quiet that Mr. de Wilton himself did not know whether the motor was running half the time or not.

I should like to add that the challenge to any manufacturer to cover fifty-nine and a half miles on one gallon of petrol in a car weighing, with four passengers, over a ton, over the same course, has not been taken up by anyone.—Yours truly,

A. E. COHEN.

ABOLITION OF CHANGE-SPEED GEAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the use of a compressed air engine in combination with a petrol motor, may we point out that our patent, No. 12136 of 1901, covers such an arrangement, and that we hope shortly to be able to demonstrate its advantages?—Yours truly,

J. ERSKINE MURRAY.

J. ERNEST HUTTON.

A QUERY RE SILENCERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a small 5-h.p. Panhard motor, and the noise from the exhaust is much more than I like. I send you a sketch of the present

silencer, together with particulars of the engine, and I shall be very glad if any of your readers would advise me what kind of a silencer to put on, and where I can get same.

The motor has one cylinder, 3½ in. diameter and 4½ in. stroke (95 m.m. by 115 m.m.), and runs at a speed of from 850 to 950 revolutions per minute. The outside diameter of the exhaust pipe is 1 5/16 in.—Yours truly,

J. P. SMITH.

STANDARDISATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—It is surely time that pressure was brought to bear by the Press and the Automobile Club upon English motor manufacturers and attempts made to insist upon their using fittings of standard sizes. Should even a bolt go wrong, the answer is always the same, "that is a special thread," and one has to send to the makers, who profess to keep replacements but do not.

A short time ago I had a twisted countershaft to my motor-car, and on referring to the maker's book found they professed to keep replacements in stock, but I was kept waiting three weeks before I could get it; and again, now I have a broken ball race, but it has been on order for more than a week, and I cannot get it delivered. The mis-statement that replacements are kept in stock is held out to intending purchasers as an inducement, but they always happen to be out of the one thing which is required. This is the sort of thing which does a lot of harm to the trade, and should be strongly discouraged and exposed. I do hope that something will now be done in the matter.—Yours truly,

E. U. STORY.

MESSRS. FRISWELLS, LIMITED, write:—Seeing Mr. Winter's notes in last week's issue of your valued *Journal*, we shall be glad if he will let us have the machine here to look at. We have no doubt we shall be able to put the matter right in a few minutes.

THE STORAGE OF PETROL SPIRIT.

THE following is a copy of the new regulations, dated March 18, 1903, made by the Secretary of State under Section 5 of the Locomotives on Highways Act, 1896, as to the keeping and use of petroleum for the purposes of light locomotives:—

In these regulations the expression "petroleum spirit" shall mean the petroleum to which the Petroleum Acts, 1871 and 1879, apply, provided that when any petroleum other than that to which the said Petroleum Acts apply is on or in any light locomotive, or is being conveyed or kept in any place on or in which there is also present any petroleum spirit as above defined, the whole of such petroleum shall be deemed to be petroleum spirit.

In these Regulations the expression "storehouse" shall mean any room, building, coachhouse, lean-to, or other place in which petroleum spirit for the purpose of light locomotives is kept in pursuance of these regulations.

1. The following shall be exempt from license under the Petroleum Act, 1871, namely:—

- (a.) Petroleum spirit which is kept for the purpose of, or is being used on, light locomotives when kept or used in conformity with these regulations.
- (b.) Petroleum spirit which is kept for the purpose of, or is being used on, light locomotives by, or by authority of, one of His Majesty's Principal Secretaries of State, the Admiralty, or other department of the Government, and which is subject to special regulations.

2. These Regulations shall apply to petroleum spirit which is kept for the purpose of, or is being used on, light locomotives, and for which (save as hereinafter provided) no license has been granted by the Local Authority under the Petroleum Act, 1871, and shall not apply to petroleum spirit which is kept for sale, or partly for sale and partly for use on light locomotives, and which must be kept in accordance with the provisions of the Petroleum Acts as heretofore.

3. Where for any special reason a person keeping petroleum spirit for the purpose of light locomotives applies for a license under the petroleum Act, 1871, and the Local Authority see fit to grant such license, such petroleum spirit shall be subject only to regulations 8 to 13, and the conditions of such license, in so far as the said conditions are not contrary to the said Regulations 8 to 13.

4. Where a storehouse forms part of, or is attached to, another building, and where the intervening floor or partition is of an unsubstantial or highly inflammable character, or has an opening therein, the whole of such building shall be deemed to be the storehouse, and no portion of such storehouse shall be used as a dwelling or as a place where persons assemble. A storehouse shall have a separate entrance from the open air distinct from that of any dwelling or building in which persons assemble.

5. The amount of petroleum spirit to be kept in any one storehouse, whether or not upon light locomotives, shall not exceed 60 gallons at any one time.

6. Where two or more storehouses are in the same occupation and are situated within 20 feet of one another, they shall for the purposes of these Regulations be deemed to be one and the same storehouse, and the maximum amount of petroleum spirit prescribed in the foregoing Regulation shall be the maximum to be kept in all such storehouses taken together. Where two or more storehouses in the same occupation are distant more than 20 feet from one another, the maximum amount shall apply to each storehouse.

7. Any person who keeps petroleum spirit in a storehouse which is situated within 20 feet of any other building whether or not in his occupation, or of any timber stack or other inflammable goods not owned by him, shall give notice to the local authority under the Petroleum Acts for the district in which he is keeping such petroleum spirit, that he is so keeping petroleum spirit, and shall renew such notice in the month of January in

each year during the continuance of such keeping, and shall permit any duly authorised officer of the local authority to inspect such petroleum spirit at any reasonable time. This Regulation shall not apply to petroleum spirit kept in a tank forming part of a light locomotive.

8. Every storehouse shall be thoroughly ventilated.

9. Petroleum spirit shall not be kept, used, or conveyed except in metal vessels so substantially constructed as not to be liable, except under circumstances of gross negligence or extraordinary accident, to be broken or become defective or insecure. Every such vessel shall be so constructed and maintained that no leakage, whether of liquid or vapour, can take place therefrom.

10. Every such vessel, not forming part of a light locomotive, when used for conveying or keeping petroleum spirit shall bear the words "petroleum spirit, highly inflammable," legibly and indelibly stamped or marked thereon, or on a metallic or enamelled label attached thereto, and shall be of a capacity not exceeding two gallons.

11. Before repairs are done to any such vessel, that vessel shall, as far as practicable, be cleaned by the removal of all petroleum spirit and of all dangerous vapours derived from the same.

12. The filling or replenishing of a vessel with petroleum spirit shall not be carried on, nor shall the contents of any such vessel be exposed in the presence of fire or artificial light, except a light of such construction, position, or character, as not to be liable to ignite any inflammable vapour arising from such spirit, and no fire or artificial light capable of igniting inflammable vapour shall be brought within dangerous proximity of the place where any vessel containing petroleum spirit is being kept.

13. In the case of all petroleum spirit kept or conveyed for the purpose of, or in connection with, any light locomotive, (a) all due precautions shall be taken for the prevention of accidents by fire or explosion, and for the prevention of unauthorised persons having access to any petroleum spirit kept or conveyed, and to the vessels containing or intended to contain, or having actually contained, the same; and (b) every person managing, or employed on, or in connection with, any light locomotive shall abstain from every act whatever which tends to cause fire or explosion, and which is not reasonably necessary, and shall prevent any other person from committing such act.

14. These Regulations shall come into operation on the 18th day of March, 1903, from which date the Regulations dated 3rd November, 1896, and the 26th day of April, 1900, are hereby repealed.

EXECUTION OF ORDERS IN REASONABLE TIME.

AT the Marylebone County Court (London), last Friday, before Judge Stonor, Messrs. Burden Bros., motor-car agents, etc., Friary Lane, Salisbury, sought to recover £13 18s. from the Carlton Motor Company, 19, Elm Grove, Cricklewood, N.W., the claim being in respect of money paid for goods which, it was said, had not been delivered within a reasonable time.

Mr. Burden, of the plaintiff firm, said that in January last his people ordered a quantity of motor fittings from the defendant, paying for the goods in advance. Witness produced a receipt for the money, adding that the defendant wrote putting them off for a time, but afterwards took no notice of their applications for the goods. Mr. Burden went on to say he understood that the defendant had delivered a portion of the goods on the previous evening.

Mr. Arthur Gower, manager to the defendant company, said that it was impossible for him to get the goods out earlier. The Judge: Then you ought to have told him so. A letter was produced in which Mr. Gower, in reply to a communication from the plaintiffs, said, "We can supply dozens, and supply them promptly."

The Judge: I find for the plaintiffs; they had a perfect right to cancel the order; and the portion of the goods which have been delivered must be returned to the defendants.

CLAIM FOR DAMAGES.

MR. LOUIS SINCLAIR, M.P. for the Romford Division of Essex, brought an action, before Mr. Justice Wright, against the London Road Car Company, to recover damages for injuries to his motor-car, sustained through the alleged negligence of the defendants' driver. It appeared that on the afternoon of May 27th, last year, plaintiff was driving his Darracq motor-car along Piccadilly. Owing to the congested state of the traffic he had to stop. While the car was at a standstill plaintiff said one of the defendants' omnibuses struck it, and caused damage to the extent of £150. After hearing the witnesses, the learned judge came to the conclusion that the evidence was not strong enough to establish negligence, and entered judgment for the defendants, with costs.

A TRAILER CASE.

AT Kingston, A. C. Osman, of Richmond, was summoned for exceeding the legal limit of six miles an hour on a motor-bicycle, having a trailer attached. P.S. Lucas spoke to seeing defendant going down Pain's Hill, Cobham, on Good Friday afternoon, with a trailer, at the rate of fourteen miles an hour. Defendant, when stopped, said he "thought that his speed was about seven or eight miles an hour. Defendant now admitted exceeding the legal limit, saying he was unaware of his pace. He had to pay a penalty of £1.

POLICE TRAPS.

SEVERAL motorists have been summoned as the result of a special effort on the part of the police on the first Saturday in May, in the hollow leading from Mill Pool Hill, King's Heath, Birmingham. Inspector Davis, armed with a fly-back centre-second stop watch, specially tested for the purpose, posted two officers in the hollow by the brook near Broad Lane, and waited events 220 yards up the slope of the next hill. The results are set forth in our list of furious driving cases.

MOTORISTS must be careful passing northward from London. The police have instituted a measured distance from the White Hotel to the Load of Hay, Edgware.

THERE is a trap at the foot of Otterburn Hill, on the road from Southampton to Winchester.

The police have a carefully prepared trap in Alton, where they have measured off 120 yards in the main street of the town.

Where no alleged speed is given it is understood to be above the legal limit.
* Motor-Cycle Cases.

THE fines in the Birmingham district seem to have been considerably reduced, judging by the amounts recorded in the motor-bicycle cases just heard.

LAST week we reported a batch of cases at the Petty Sessional Court at Garretang, in Lancashire. In one, Mr. Tilly, solicitor, of Lancaster, appeared for the defendant and produced a plan showing that on the road where his client was trapped there was a straight course for upwards of a mile and a quarter in length, and the police admitted that at the time the road was absolutely clear, and that the defendant disputed the accuracy of the constable when informed that he had travelled at the rate of a little over sixteen miles an hour. In another case Mr. G. D. Walmsley, solicitor, of Blackburn, appeared for the defendant and closely cross-examined the police witnesses, ascertaining that the policeman was hiding behind a wall without any opening, and that the occupants of the car could not see him, and that he started his watch as soon as the car had passed. Although pressed to state how he knew that the car had passed he could not for some time give a reasonable explanation, but eventually stated he looked over the end of the wall. He admitted that the length chosen was the lower half of a hill including a short portion of the ascent beyond the bottom,

that the road was dusty, and that he himself had checked the time it took the car to travel from the point where he was to another point 400 yards away. Another witness admitted that there was no person or vehicle on the road or the footpath. It was also stated in cross-examination the road was a V-shaped one, and he held up his arm, stating that it was like the joint made by his elbow. The outside edge of the curve was the distance measured, and if the defendant had kept on his own side of the road he had not travelled the full distance. This evidence was contradicted by that of another witness, who stated that he had examined the road and that he had measured it in the middle, and that the road was a serpentine one. In spite of these admissions, and the unsatisfactory nature of the evidence, both as to the timing and as to the measurement, the magistrates held that the cases were proved, and inflicted fines ranging from that of 20s., in the case of a motor-cyclist, up to £5 and costs.

MR. H. E. BARKER has opened a motor-car garage, with inspection pit, at 303, Halifax Road, Todmorden.

SIR J. DIXON POYNTER and the Hon. Matthew White Ridley M.P., are among the latest clients of the Motor Mart, Ltd.

THE Northern Motor Co., of Montgomery Street, Belfast, will have supplies and offer assistance to motorists visiting the city during the Irish fortnight.

AT the annual meeting of the Wimbledon Common Conservators complaint has been made of the excessive speed at which motorists cross the common.

HERR VOLLMER recently delivered an interesting lecture before the Berlin Automobile Society on motor-cars for fire brigade purposes. The meeting was held at the headquarters of the Berlin Fire Brigade, and attended by the Chief Commissioner of Police and the Chief of the Berlin Fire Brigade.

THE Dermatine Company, Limited, forward a copy of their new catalogue, including a short illustrated article on the discovery of manufacture of india rubber, gutta-percha, and Dermatine. This latter product is now being used in the manufacture of belting, mats, and other goods in connection with automobiles.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shos Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

[No. 221.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE avalanche of fatality which rushed down the route of the Paris-Madrid race has struck a note of horror throughout the world, and will do much to stem the tide of the reckless daring that threatened to overwhelm the motoring community. Sometimes great disasters are needed to bring men to their senses, and the way in which Continental automobile races were being run was becoming so venture-some, foolhardy, and dangerous, that the catastrophes of Sunday last may have the effect of preventing greater horrors. From simple runs through rural scenery these events have

developed into international orgies. Speed on speed has been the motto of the car builders; motorists have become heroes of the arena with their admirers, whose enthusiasm has assumed something of the gladiatorial tinge; the populace has developed the excitement with which the Spanish people regard their favoured matadors, and the frenzy with which the riders have often entered upon their races has been mistaken for ordinary pluck.

A Comparison.

THE truth is that the day of the mad rush of hundreds of engines over hundreds of miles, with thousands of spectators risking their limbs along the course, was of but short duration.

Less than a decade ago motor-cars were clumsy monsters, ungainly and unwieldy; now they are perfect mechanisms, and hence the danger of placing a couple of hundred of such machines upon the road at only one minute's interval after each other. Paris-Madrid has brought everyone to his and her—for women had become competitors—senses. Such a holocaust has a terrible lesson.

Impossible in England.

At the same time the British people need have no occasion for the agonised legislation which some have proposed. Already it is suggested that automobiles should be treated as trams and run upon rails; that the speed should be restricted; that everything be done, that is possible to drive the car off the road and restore the horse as the monarch of the highway. Such is the fear of panic, and not the voice of reason. England never has had, nor ever will have, road races such as have startled and terrified more than one continent. Local authorities would not consent to giving over their roads merely to make a motorists' carnival—if such a ride into the valley of death can be so lightly described. Motorists, too, regard the roads as for utility; not the maddened rush for speed—more and more speed. Hence the purchase of the track at Purley, the trials on the private estate at Welbeck, and the preparations now being carried out in connection with the forthcoming race in Ireland.

The Gordon Bennett Race.

At the moment the jeopardy in which it was thought the Paris-Madrid horrors would place this event is the practical question, and we would join with the Automobile Club in its public re-assurance as to the improbability of even a mild repetition of such events as have marred the past week. The circumstances are essentially different. The course for the Gordon Bennett race is within an area that can be adequately guarded and watched by the 7,000 police, soldiers, and voluntary helpers who will be distributed along its length on the great day. Spectators will be kept on the other side of walls, ditches, and hedges, cross roads will be strongly barricaded, and the fact that there are no level crossings removes a cause of danger that proved fatal in the recent race.

A Word of Warning.

At the same time we would not minimise the necessity that exists for the Automobile Club taking every precaution. There must be no negligent observers, no idling stewards. Everyone who is about the course on July 2nd must recognise the importance of the occasion and maintain a watchful attitude from the start to the finish. And even after the race is over care will be necessary—in fact, it will be on the roads leading to and from the course that the greatest care will have to be taken. Drivers will have to be impressed with the need for careful and steady driving, or a panic will quickly be created in the crowds. For it must be remembered that the Irish people are less familiar than are those of the Continent with automobile contests, and their curiosity to see the racers may lead to dreadful crushes if motorists do not exercise extreme caution throughout the Fort-night.

The Preparation of the Roads.

Of course, the character of the road surface must always be considered in connection with events of this character, and there is no doubt that the route for the Paris-Madrid contest was in a dusty condition. In Ireland, however, great preparations are already in progress to minimise the dust danger, and to lessen the risks in rushing round corners. More must still be done in this direction, and hedges must be carefully attended to so that the racers may have a clear view of the sinuous course. For while there are good straight stretches, it must not be forgotten that there are many sharp turns, while the difficulty of cars attempting to pass each other on nearing the narrowing highway is a very real one. The organisers of the event must look to this matter.

Local Regulations.

TUESDAY night's "Dublin Gazette" contained an order by the Local Government for Ireland, empowering the County Councils of Carlow, Kildare, and Queen's County to make regulations for the holding of the Gordon Bennett race on July 2nd by the Automobile Club of Great Britain and Ireland. The roads specified are to be closed from six a.m. till

the end of the race, and all roads leading to the course are to be barred. No automobile will be allowed to travel on these side roads at more than ten miles an hour. An officer is to be stationed at ten points of the course to give notice by sounding a bugle of the approach of a racing car. The County Councils are to send notices to all householders and land occupiers on the course that all live stock should be kept under control on the day of the race. There are other minor regulations laid down by the Local Government Board which the County Councils must enforce. The road is to be kept by official stewards, Royal Irish Constabulary, and military.

Motor-Bus Service at Torquay.

HASTINGS, St. Leonards, and Eastbourne have their motor 'bus services, and now a similar venture is about to be inaugurated at Torquay. We understand that already arrangements are well advanced, it being the intention of the promoters to give a trial to the Chelmsford 'bus, and the service will probably consist of five or six vehicles—two to ply between the Torquay Railway Station and the Strand or the foot of Beacon Hill, two to serve St. Marychurch and Babbicombe, and one or two to run between Torquay Railway Station—along Union Street and Fleet Street—and the Strand. In this way the whole of the town will be served. The fare for the journey from the Strand to Torquay Railway Station will probably be 2d.

Weighing in for Paris-Madrid.—A snapshot in the Place de la Concorde, Paris.

The Motor Volunteers.

THE first enrolment of London members of the Motor Volunteer Corps took place at headquarters on the 15th inst. Dr. A. C. Shaw was most indefatigable in helping the enrolment. General Oliphant has been using members' services during the past week in connection with his military duty, and has enlisted such services until the 30th inst. Mr. J. Bennett-Stanford will be now engaged at Ringwood camp, in connection with manœuvres under Colonel Le Roy Lewis, until the 6th prox. Colonel Dawson, commanding the Irish Guards and Second London Volunteer Infantry Brigade, requisitioned for the services of a member of the corps on Saturday last, in connection with the cycling manœuvres under his command. Messrs. J. Bennett-Stanford, Ker-Seymer, and G. D. Chapman have been recommended for commissions by the officer commanding.

Dock Rules for Motor Traffic.

SOME discussion having arisen with regard to the facilities allowed motor vehicles at leading docks, we publish the following regulations enforced at the Surrey Commercial Docks, Rotherhithe, S.E.:—(a) That all vehicles in which liquid fuel is used for internal combustion (*i.e.*, as an explosive

force) be prohibited from entering the premises. (b.) That all vehicles in which coal is used, and all vehicles which have "underfed" boilers be excluded from all buildings in which goods are placed. Such vehicles are not allowed to pass along the roads which run through the sheds used for the storage of wood goods, but they may be permitted to use the roads adjacent to the sheds. (c.) That all vehicles in which coal or coke is used be required to have baffle plates at the base of the funnel, and approved spark arresters, as well as approved boxes or other receptacles for cinders. (d.) That no vehicles except electric or air driven shall be left unattended at any time while in any building in which goods are placed, and that no clearing of the cinder receptacles nor "clinking" shall be allowed, nor shall the steam blast be used therein. (e.) That no vehicles except electric or air driven shall be housed for the night in any building in which goods are placed, nor in any building communicating therewith.

In the Lords.

AFTER the discussion in the House of Lords, to which we referred last week, it did not surprise anyone to learn on Saturday last that Mr. Long's proposed motor-car bill would be introduced into the House of Lords instead of the initial stages being conducted in the Commons. After all, this is perhaps the wiser course, and motorists will be able to amuse themselves during the Whitsun holidays by guessing competitions of an informal character as to the likely provisions of the measure. We hope the clauses will be drawn up in a liberal fashion. The suggestions of some of the minor councils may well be ignored, and the general welfare of the country considered in preference.

Yeovil Again.

For instance, the Yeovil Council, which was prominently identified with the earlier agitation for numbering, has just adopted a resolution in favour of the retention of the present unsatisfactory and absurd speed limit. This is a position which we had thought had become untenable after the declaration of its author, Mr. Chaplin, to the effect that the regulation was framed to deal with the circumstances of the time, and that it has become antiquated and indefensible. Certainly the present is a trying one for motorists, and the postal vote of the A.C.G.B.I. has by no means straightened the chaos into order.

Motor-Car Legislation.

THE Automobile Club of Great Britain and Ireland have ascertained, by means of a postal vote, the views of automobilists generally upon the various proposals respecting motor-car legislation. Members of the Club, the Affiliated Provincial Clubs, and the Motor Union, were asked to reply to the three questions set forth in our issue of the 16th inst. The answers have been received and tabulated, and the results are shown in the statement on another page. It will be seen that by 1,015 votes to 463 the members voting have approved of legislative proposals, which include the abolition of the specific speed limit, the amendment of the law with regard to furious driving, the raising of the tare limit for commercial vehicles, and the identification of motor-vehicles by means of conspicuous numbers or names. A bill embodying these proposals will be introduced into Parliament on behalf of the Club during the next few days.

South Wales Automobile Club.

ON Saturday the members of the South Wales and Monmouthshire Automobile Club arranged a run to Brecon, in which some twenty cars took part. The weather being summerylike, the event proved both delightful and exhilarating. The route was via Aberdare, Hirwain, and the Story Arms. A procession was formed through Brecon to the Castle Hotel, where the members of the Club were most hospitably entertained to lunch by Captain D. Hughes Morgan, J.P., and at the same time

met the Mayor and other members of the Corporation. Speaking after lunch, the Mayor of Brecon informed the visitors that the local authorities were not getting a source of revenue through fining motorists for fast driving, as some other counties were doing, and stated that as far as he knew they were allowed to go as fast as they liked. The first car to arrive in Brecon was Mr. David Duncan's Daimler. The return journey was made via Abergavenny, Usk, and Newport. On the whole a very pleasant day was spent.

Home Office Laxity.

It may have appeared somewhat strange that the new regulations relating to the storage of petroleum spirit issued by the Secretary of State in March last should only have been dealt with in our last issue. We venture to assure our readers, however, that the laxity was not on our side. Indeed, it was quite by accident that we discovered that any new regulations had been issued. We should not have referred to the matter except for the fact that a North London ironmonger was last week fined for storing a quantity of carbide of calcium on his premises without a licence, as required by Orders in Council

London. They consist of a basement and five large floors, the whole having been specially built for the purpose. The basement has been fitted as a repair shop with work benches and the pit lining one entire side of the building. Facilities for the charging of electric vehicles, etc., are also afforded, while a licence has been obtained for the storage of two hundred gallons of petrol. The other floors are for the purposes of garage and show-rooms, while, as on the ground floor, the roof is also adopted for the washing of cars, a large electric lift running from the basement to the roof. It is stated there is garage accommodation for two hundred cars, the space available being 30,000 square feet. The whole building forms one of the most modern of car houses, and the commendable enterprise exhibited is certain of its own reward.

A Public Protest.

THE first public meeting of protest against the reckless driving of motor-cars has just been held—a fact which ought to be a warning to the inconsiderate drivers whose action has done much to bring discredit upon automobilism. This took place at Shrewsbury on Saturday to protest against the high rate

The Paris-Madrid Race.—The arrival at Bordeaux of Valentin (No. 16) on Ader Car and Bardin (No. 81) on De Dion.

made under the Petroleum Acts, 1871 to 1879. The defendant pleaded ignorance of the law requiring a licence, but the solicitor for the London County Council pointed out that the Order had been published in the *London Gazette*. Now, if publication in the *Gazette* is to be taken as evidence of the issuing of regulations, care must be taken by the authorities that such publication is made. No doubt it is the rule that any new important regulation, such as those relating to the storage of calcium carbide and petroleum spirit shall be dealt with in the official organ, but in the case of the new rules relating to petroleum spirit, reprinted in our last issue, we can find no reference to them in the *Gazette*. Consequently, motorists have been in ignorance of their existence for about two months.

An Up-to-Date Garage.

ON Wednesday week, to celebrate the opening of the London Motor Garage Co.'s new premises in Wardour Street, W., a number of friends and members of the Press were invited to lunch on the premises. Mr. Claude Watney presided and Mr. Atherley gave particulars of the extent of accommodation of the new premises, which are the largest of their kind in

of speed at which motor-cars were now driven, and to form an association to institute legal proceedings against offending motor-car drivers. Mr. R. B. Phillips, chairman of the Roads and Bridges Committee of the Shropshire County Council, presided. Letters approving of the steps proposed to be taken were received from Mr. H. D. Greene, K.C., M.P., Mr. Jasper More, M.P., and others. The chairman explained that the promoters of the meeting did not ask for war to be waged against motor-cars, but that a check should be put upon the recklessness of drivers. With a view to this end being gained he suggested the introduction of a law to compel drivers to hold certificates of qualification, the numbering of cars, and to cast the responsibility for damage caused through the driving of them upon their owners. Mr. John Hill proposed "That this meeting protests against the reckless manner in which motor-cars are being driven, to the great danger of the public, and resolves to form an association to investigate any charge made by members, and, if necessary, to prosecute offenders for damage sustained, the society to be called 'The Shropshire Association for Protection Against Dangerous and Reckless Motor-car Driving.'" The Rev. Watkin Temple seconded. The motion was carried, and a committee was appointed to draw up rules, etc. Mr. T. S. Minton was elected hon. secretary, and Mr. J. Davies treasurer.

The West Surrey Club.

ON Saturday the recently-formed West Surrey Automobile Club held their inaugural run to the Huts Hotel, Hindhead, where members and friends to the number of thirty-five sat down to tea. At its conclusion, the Chairman, the Rev. A. Armitage, made a few remarks on the successful progress made since the inception of the Club some three weeks back, and on its programme, which includes the establishment of a commodious garage for the use of members in Guildford. Those present included Mr. Armitage (12-h.p. Darracq), Colonel Fairtlough and party (12-h.p. Darracq), Mr. Ponsford (8-h.p. Clement), Mr. Leon (ditto), Mr. E. Baring-Gould (10-h.p. Panhard), Mr. Tessier (9-h.p. Argyl), Mr. Crothers (9-h.p. Darracq), Miss Crothers (5-h.p. Peugeot), Mr. Simmonds (10-h.p. Decauville), Mr. R. W. Buttemer (10-h.p. Decauville), Major Matheson (6½-h.p. Benz), Dr. Fennings (5-h.p. Benz), Mr. King (3½-h.p. Benz). After the cars had been marshalled for the benefit of the camera fiends present, a start was made for Frensham and Farnham, most of the members following this route home.

Opinion in Hertfordshire.

HAVING regard to the great North Road, the County Council of Hertfordshire is naturally interested in motoring, and at its last meeting very strong remarks on the dust question were made by some members who happen to live in proximity to the famous highway. The Standing Joint Committee proposed a resolution in favour of registered numbers being placed on cars, and the speed limit being abolished, but this was referred back for consideration. A sound speech was made by the Earl of Verulam, who pointed out that in passing vehicles drawn by animal power the faster the motor went the less likely the animals were to be frightened. At the Quarter Sessions for the county the Chief Constable suggested the licensing of drivers, but the Right Hon. T. F. Halsey, M.P., doubted the practicability of the proposal. They might have their servants licensed, but many people would like to drive their own cars, and they could hardly expect everybody to pass an examination in order to be able to drive their own cars. In fact, he did not think it was necessary that they should do so.

Alleged Police Complaints.

IN our correspondence columns Colonel Stratton Bates, who is a J.P. for Hampshire, writes calling attention to the statement made by the Marquis of Granby in the House of Lords the other evening, when he said that the Chief Constable of Hampshire had reported the receipt of thirty or forty complaints as to the serious damage done by motor-cars. This statement was too important to allow to go uncontradicted, and in publishing the reply of the Chief Constable of Hampshire Colonel Bates has rendered a service to motorists at the present juncture, when prejudice seems to be rampant again.

Numbering Electrical Vehicles.

A PETITION against the proposal that motor-cars should be compelled to carry numbers for purposes of identification has been presented to the House of Commons by a number of owners of electrical vehicles for town use, including the Duke of Sutherland, Lord de Grey, Lord Hood, Lord Esher, Lord Duncannon, the Duchess of Roxburghe, the Countess of Essex, Georgina, Countess of Dudley, the Hon. Mrs. George Keppel, Sir Edward Lawson, Mr. Samuel Montagu, and Mr. Stuart Samuel, M.P. They contend that it is unnecessary and would be vexatious to provide that ladies and gentlemen who elect to be driven in electric broughams and landaulets in preference to horse-drawn vehicles when making calls in London, driving in the park, or attending the opera or theatre, should be required to have attached to the back of their carriage a large disfiguring number or name. Such a provision, they say, would practically put an end to the use of such vehicles in London. The petitioners pro-

test against the proposal that the conspicuous marks of identification which it is proposed to attach to motor vehicles in general should be attached to electric vehicles for town work.

The Club Bill.

THE measure the Committee of the Automobile Club has prepared, and which will be introduced in the House of Commons very shortly, includes proposals for doing just what the above petition protests against. The object of the Bill is to provide for the numbering and registration of motor-cars, light locomotives, and such-like vehicles, and to enable proper means to be taken under regulations of the Local Government Board for the identification and punishment of the persons unlawfully using them. The Bill also provides for the abolition of the specific speed limit and for the licensing of paid drivers of light locomotives.

A Norfolk View.

FOLLOWING the conviction of motorists in connection with the inaugural meet of the Norfolk Automobile Club has been a long correspondence in the county papers, in the course of which Mr. E. Estcourt has pointed out that "the motor-car is quite as much a private carriage as the horse-drawn vehicle, and that it is an open question which is the best looking." In his opinion the motor-car is by far the best. Certainly the body part of a good car costs more, and is quite as carefully built as the best carriage, and would undoubtedly be just as much spoilt by a number plate. What we contend is that no one has any right to take either a horse, motor-car, or anything else on the highway unless he has perfect control over it, and the sooner this is realised by the drivers of untrained horses the better.

THE Anglo-American Oil Company will supply petrol to retail in Ireland at 1s. 8d. per gallon during the Automobile Fortnight.

THE Wolverhampton Automobile Club had a run to Ludlow on Saturday, the captain for the day being Mr. T. Cureton.

A SUGGESTION for the starting of cars in the Gordon Bennett race at intervals of three minutes has been referred to the French Automobile Club.

MR. WM. CARRITTE, of Messrs. Bradbury and Company, of Oldham, has been elected for the third successive year chairman of the Manchester and District Cycle Trades Association.

SEVERAL questions relative to automobilism were asked by M.P.'s in the House of Commons on Wednesday. No information was elicited other than that already published, or which appears in the present issue of the *Journal*.

AN informal tour of the Liverpool Self-Propelled Traffic Association will be held to-day (Saturday). The members will leave the Liverpool landing-stage by the 1.50 p.m. boat for Birkenhead, proceeding via Queensferry, Flint, and Abergele, to the Grand Hotel, Llandudno.

THE Committee of the Scottish Automobile Club have considered the report on the non-stop run, and have decided that one mark shall be deducted from the Rochet-Schneider and Chenard-Walcker cars for driving stops, and they have also disqualified No. 25, the F.A.C. car.

THE works of the Motor Manufacturing Company, Limited, at Coventry, will be closed from Saturday, 30th inst., to Wednesday, 10th June, for the annual stock-taking. The permanent staff will be in attendance, as usual, and every endeavour will be made to promptly dispatch all goods ordered during that time.

MINERVA MOTORS, LIMITED, has been registered with a capital of £130,000, in £1 shares, to acquire the businesses carried on by Messrs. S. de Jong and Co., at Antwerp, and dealers in motors, motor-cars, and accessories carried on by Mr. D. Citroen, at 45, Holborn Viaduct, London. The first directors are Messrs. S. de Jong and D. Citroen (managing directors), and others to be appointed by the signatories.

The Paris-Madrid Race.

[FROM OUR OWN CORRESPONDENTS.]

PARIS, Sunday.

FINE weather set in definitely for the weighing in of the cars for the Paris-Madrid race, which has now become a thing of history, and the sight at the Tuileries Gardens, in the Place de la Concorde, and, indeed, almost all about Paris, was remarkable. Crowds surrounded the gates of the Tuileries Gardens, and each racing car was examined with close attention. So great was the number of cars to be weighed in that two weighing machines were needed. Many were the tribulations of those who had to present their cars to the Inspector of Mines, in order to have the new types passed, for the law in France exacts that every manufacturer of cars, before he is allowed to let them circulate, must present them to the "Service des Mines," to have them examined and pronounced safe. The great object of the inspectors of this rather perfunctory operation seems to be to make known to the world in general, and automobile manu-

M. Louis Renault (No. 3 at the Weighing In.

facturers in particular, the extreme importance of their position. A long harangue first takes place until the unfortunate postulant makes up his mind that his car is going to be refused, and then, after waiting for an hour or more, and giving the inspector and his assistants certain runs on the car, all the difficulties seem to vanish as if by enchantment, and the coveted certificate is obtained.

On Saturday, about noon, the sky began to cloud over, and threatened a storm; but, fortunately, towards evening the clouds rolled away and left behind them a beautiful starlit night, with summer temperature. The sight on the Place de la Concorde, in the Champs Elysées, along the Bois de Boulogne, over the Bridge of Suresnes, and on to Versailles, was one never to be forgotten. Constant streams of enthusiasts on foot, bicycles, motor cars, and on every kind of animal-drawn vehicle, crowded the roads in every direction, all with one purpose, streaming out to Versailles, ready to spend the whole night without thinking of bed, all to see the competitors start on the great International

Automobile Road Race. Versailles has not known such a night since the King of France lived there. In all directions there were illuminations, as if the Great King had been coming back to take possession of his palace. All the shops were open, and the footpaths were impassable on account of the supper tables which had been installed everywhere. It is estimated that fully one hundred thousand visitors crowded around the starting place. The cars were lined up at the side of the road, numbers being hung on the trees to indicate to each competitor where he should take his place. It is said that 25,000 litres of petrol—equal to nearly 6,000 gallons—was supplied by one firm alone. The 5th regiment of the Engineers lined up the road and kept order, and, soon after daybreak began to colour the sky, two rockets announced that the competition had begun, and Jarrott, on his De Dietrich, at 3.45 opened the ball. After him, at a minute's interval, followed De Knyff, Louis Renault, Thery, and so on. Sydney Girling, on the first English car, a Wolseley, started

M. Lorraine-Barrow (No. 5) on his 45-h.p. De Dietrich.

12th, and the 16th starter was Madame Du Gast. Rolls started 35th, on a Panhard; Mark Mayhew, on his Napier, got away 63th at 4.51; Hubert Olliver, on a Serpollet, started 90th, at 5.13; and Austin followed 97th, on the second Wolseley, at 5.20. Holder, on a Panhard, started 102nd, at 5.24, and so on, until at 6.45 the last motor-bicycle had got away. It will thus be seen that, curiously enough, exactly three hours were taken in starting the competitors.

So much for the start of this race, which has gone ahead over and above last year's international event, namely, Paris-Vienna, by leaps and bounds, both in the number of cars which started, in the speed and in the horse-power of the vehicles, and in the interest it has attracted all over Europe. The total number of starters was as follows:—

Large and light cars	138
Voiturettes	32
Motor-bicycles	53

Grand total 223

D

CHARTRES, Sunday.

Great preparations had been made here for the safe passage of the competitors through the town, which was, of course, "neutralised." L. Renault, No. 3, was the first competitor to pass through the place, which is 74 kilometres from the starting point, at 4 h. 41 min. 40 sec., followed by C. Jarrott, No. 1 (De Dietrich), at 4 h. 42 min. 31 sec.; R. de Knyff (Panhard), No. 2,

H. Fournier (No. 5) on his 70-h.p. Mors.
(Allgemeine Automobil Zeitung.)

at 4 h. 43 min. 45 sec.; Thery, No. 4 (Decauville), at 4 h. 51 min. 20 sec.; Stead, No. 18 (De Dietrich), at 4 h. 55 min. 30 sec.; S. Girling, No. 22 (Wolseley), at 4 h. 57 min. 10 sec.; and Werner, No. 14 (Mercedes), at 4 h. 58 min.

Just before six o'clock fifty-five competitors had passed, sometimes at intervals of several minutes, and sometimes close together. Rolls, No. 59 (Panhard), passed 28th, at 5 h. 24 min. 25 sec.; Guders, No. 94 (Pipe), passed 41st, at 5 h. 39 min.; and Mark Mayhew (Napier), 55th, at 5 h. 55 min. 20 sec.

It is reported from Ablis that a car ran into and killed a woman who was crossing the road.

W. K. Vanderbilt, Baron de Forest, and Fournier, all on Mors cars, and De Knyff (Panhard) abandoned the race at this point owing to accidents to their vehicles.

At a point between Ablis and here Baron de Caters drove his Mercedes into some ploughed land at a turning, and his mechanic was thrown out. After twenty minutes' delay, they were able to proceed.

TOURS, Sunday.

Arriving at Tours on Saturday night we found the town in a tumult, and every hotel filled to overflowing. At six o'clock this morning we drove out to the Control on the far side of the town, that is to say, nearer to Bordeaux, where the roads were thickly lined as far as one could see with crowds of people, waiting to see the cars pass by. At five minutes past seven Louis Renault came flying along. There was a remarkable difference between his car and most of the others, easily distinguishable by the noise of the exhaust, which did not give one the idea of great power, but more of complete regularity and lightness. After seeing Louis Renault pass, we turned slightly towards Tours, and about a quarter of an hour afterwards saw Werner at the top of the hill, in a cloud of dust, and a deep roar told us at once that it was a 90-h.p. Mercedes. Just before we reached the brow of the hill, Jarrott turned the corner on his De Dietrich, and waved his hand in recognition as he passed. He was followed by Stead and then Baras. Madame Du Gast, on another De

Dietrich, came 8th, and then Maurice Farman on the first Panhard, followed by Marcel Renault. As we were descending the hill, we saw Rolls, with Crompton as mechanic, going round the bend, and Chanliaud on a Serpollet, going very strong. The first Mors came 16th, driven by Salleron, and a little later Gabriel, on the second Mors, came fast and furious up the hill, fully twenty-five minutes in time ahead of any of the others. Towards eight o'clock we got down to the Control, seeing Mark Mayhew, on his Napier, come by.

In the Control, the first man we met was Lieutenant Cumming, who was acting as mechanic on his Wolseley car, which was being driven by Sydney Girling. He started 12th at 3.56, and had fallen back to 55th, on account of hot bearings. Soon the voiturettes began to arrive, and three little Georges Richards, with four-cylinder engines, were well up to the front, closely followed by two Renaults. We noticed several Passy-Telliers, with curious blue-painted bodies in the shape of inverted boats, several smart-looking Clements, and also two or three Darracqs, with stamped steel frames, perforated to reduce weight, from one end to the other. Just as we were leaving to catch the train we met Mr. H. Austin on the second Wolseley, suffering from hot bearings. Austin told us that he had had a nasty experience with a Mercedes. It seems that the car was passing and swerved right in front of him, and then began to swerve from side to side, until one of the hind wheels smashed and let the petrol tank down on the road. The car was in a blaze in a moment, but, fortunately, no one was hurt, and Austin went on, after stopping to ask if he could be of any assistance. Henry Farman (Panhard) gave up at Vendome, *en panne*, as a result of trying to avoid a pedestrian.

POITIERS, Sunday.

Poitiers, 316 kilometres from Versailles, was *en fete* to receive the daring riders. L. Renault was the first to reach the town at 8 h. 23 min. 5 sec.; Jarrott was second, passing at 8 h. 43 min. 42 sec., followed by Baras, No. 47 (Darracq), at 8 h. 52 min. 30 sec.; Thery, No. 4, at 9 h. 2 min. 20 sec.; M. Farman, No. 38 (Panhard), at 9 h. 2 min. 45 sec.; Marcel Renault, No. 63, at 9 h. 5 min. 30 sec.; Jenatzy (Mercedes), at 9 h. 9 min. 50 sec.; Madame du Gast (De Dietrich), at 9 h. 15 min. 3 sec.; and Rolls, No. 59, at 9 h. 19 min. 32 sec.

G. Olliven (No. 201) on his 20-h.p. Serpollet.

The sad news was brought in that a fatal accident had happened at the level-crossing over the Paris-Tours railway line, about a mile from Bonneval, the Wolseley car, No. 243, driven by L. Porter, being overturned and catching fire. The person whose duty it was to mark the level crossing with a yellow flag had received instructions authorising him to leave his post. Shortly afterwards Porter's car approached at full speed. In-

stead of going round to the left, the car made straight for a hut occupied by a gate-keeper. Mr. Porter was thrown forward several yards. Nixon, the mechanic, was found burned to death under the car. Porter was taken to the hospital, where he recovered consciousness three hours later.

M. Béconnais, who was driving a Darracq, took a turn too quickly just outside Chatellerault, and smashed a wheel. Another car dashed up and smashed the vehicle to pieces. The driver of the second car was thrown out, but was not badly hurt.

M. Rivierre (Pipe) in trying to avoid running over a woman collided with the side of a bridge near this town and broke a wheel. Marcel Renault, last year's Paris-Vienna winner, fouled a tree, and was thrown from his car a few miles from here, both his legs being broken and his skull fractured. His mechanic was also so seriously injured that his life is despaired of. Later reports of M. Renault are but little more favourable. It is worthy of note that Maurice Farman, on seeing Renault lying bleeding by the roadside, threw away his chance in the race and went to his unhappy comrade's assistance.

The Start of the Tourists. Madame Lockert on a 12-h.p. Ader.

BORDEAUX, Monday.

Great excitement prevailed here in expectation of the arrival of the racers. A company of the 144th line regiment had been called out to keep order at the Control a few miles away. The special train arrived in plenty of time to witness the first arrival, who proved to be Louis Renault, coming to a stop at 12 h. 14 min. 45 sec., after having safely made the journey of 345 miles. Jarrott turned up a few minutes later, and met with a hearty reception. Appended is the list of cars which reached Bordeaux up to last night, in order of arrival:—

Although L. Renault was the first to arrive in Bordeaux the best time was done by Gabriel, on a Mors. He accomplished the journey in 5 h. 13 min. 31 sec., not counting the neutralisations, and making the marvellous average of 106½ kilometres per hour, that is to say, a little over 66 miles an hour, beating all existing records by a large margin. Gabriel reported that all along the road the spectators behaved with the utmost imprudence. They crowded the course, and only allowed a clear way at the very last moment, when the cars were upon them. Under the circumstances, it is a wonder that more accidents did not happen. The most alarming spectacle was seen towards the end of the race. The thousands of spectators, imagining the last competitors had passed, poured on to the road in a dense stream to return home. Suddenly shouts in the distance announced

belated cars and motor-cyclists tearing along at maximum speed to make up for lost time.

Louis Renault said that the chief misfortune he had encountered was to have run over three or four dogs. He had considerable difficulty with his tyres, while the crowds which had collected to see the cars caused him much uneasiness at times.

After the arrival of the leading competitors news was received by telephone from Libourne that the De Dietrich car, No. 5, driven by Loraine-Barrow, ran over a dog near Arveyres. The car ran off the road and dashed into a tree. The mechanic was killed, and Mr. Barrow was so seriously injured that he had to be conveyed to hospital. According to a later report, however, he is progressing favourably.

Mark Mayhew narrowly averted meeting with a nasty accident, owing to the steering gear of his Napier getting out of order. The car headed for a tree, and Mr. Mayhew, although he put on the brakes, received a severe shock.

Austin stopped at Couhé-Vérac, 213 miles from Paris, through a cross-head pin firing and breaking the connecting-rod.

lifetime. There is hardly a driver of a car which arrived who has not some thrilling experience to relate.

MADRID, Monday.

Enormous preparations had been made for the races in Spain. The Spanish Red Cross Society had established thirty-six posts between Irun and Madrid, each having a doctor and an assistant, eight stretcher bearers, and two cyclists, ready to give first-aid to anyone who might be injured. It was not till after ten o'clock this morning that the Royal Automobile Club of Spain received an official telegram from its Paris Commissioner announcing the decision of the French Government suspending the race in French territory. At first the news was read with incredulity. Then the predominant feeling was one of widespread disappointment, as the race had excited much interest. About mid-day the authorities issued, by telephone and telegraph, orders prohibiting the race in Spain, and instructions to suspend the preparations in Madrid and in the provinces, where almost everything was ready. The Automobile Club has telegraphed to Bordeaux, inviting the racers to come to Madrid as tourists.

Jarrott on his De Dietrich arriving at Bordeaux.

Stead (De Dietrich) met with a bad accident near Montguyon. It is stated that he had just left the village of St. Pierre du Palais, on the border of the Gironde, and was endeavouring to pass Salleron. He had put on full speed, when his car overturned in the ditch, and he was imprisoned underneath. When released it was found that he was unconscious, and that both he and the mechanic had sustained injuries.

Near Angoulême M. Tourand's Brouhot car, No. 23, met with an accident, and it is reported that M. Tourand was killed, and his mechanic and two spectators injured. Another account, probably the correct one, says that M. Tourand was seriously injured, but that the mechanic, two soldiers, and a child were killed.

M. Hautvast's Pipe car, No. 43, caught fire at Angoulême, but having extinguished it, he continued the race.

M. Georges Richard ran into a donkey-cart at Angoulême, and had several ribs broken.

The majority of the drivers of the big cars are gratified that the further stages of the race have been stopped. With a few notable exceptions, they are unnerved, and declare that yesterday they had quite enough narrow escapes to last them a

PARIS, Monday.

Little did I think, as I saw the competitors start off on their long run, that accidents would transform the race, which has been so looked forward to by everybody interested in the automobile industry, into a veritable disaster. But shortly after noon (Sunday) disquieting telegrams began to reach the Automobile Club at the Hotel Pastoret. All along the line of route from Paris to Bordeaux the same excitement existed. Every town and village was crowded; accommodation was strained to the utmost, and, indeed, thousands passed a sleepless night, in order to be ready to see the great racers pass by. And, notwithstanding all these hopes and expectations, the day ended in sadness and gloom to all, and has left a sad and serious impression on the minds of even the most enthusiastic advocates of road-racing. It is the first occasion on which fatal accidents have occurred to competitors in one of these international contests. Although there were accidents in both the Paris-Berlin and the Paris-Vienna races, there were no fatal results to either competitors or their mechanics. Thinking over this regrettable list of accidents which have taken place in the first day's running of the Paris-Madrid race, one cannot help noticing that they are

almost all due to excessive speed, and not to lightness of construction. It seems, therefore, that the conclusion to be drawn is that the safety limit of speed on the road was reached a year ago, and now that limit has been passed. I do not mean to say that there is any danger in the highest possible speed on an open road; but the point has been reached where the least obstacle, entailing a sudden stoppage or a sudden swerve, entails almost the certainty of an accident. On Sunday night, M. Combes, the Minister of the Interior and President of the Council, decided to put an end to the Paris-Madrid contest so far as the French section was concerned, in view of the long list of casualties, and I do not think any right-minded person will find fault with this decision, although it may strike a heavy blow on the automobile industry, and entail losses to a great many people. On lunching at the Automobile Club to-day, I found a great crowd assembled, and every available place taken, no doubt with the object of hearing the latest news and discussing the situation. It was the almost universal opinion that the Government had done right in stopping the race, although, when the accidents are summed up, it will be found that nearly all of them were caused either by stray dogs on the roads or by the imprudence of the spectators.

BORDEAUX, Tuesday.

The cars which took part in the race commenced to disperse this morning. Most of them will be sent back to Paris by railway. The owners of others have undertaken to proceed at a moderate speed, and if possible to take different directions.

His 80-h.p. C.G.V. racer not being ready in time to weigh in for the race, Charron started on an ordinary 15-h.p. touring car, with Madame Charron and a mechanic, arriving at Bordeaux thirtieth in his class.

MADRID, Tuesday.

The Spanish Automobile Club organised an expedition to-day to meet the "tourist" motor-cars at the Escorial. Fifty-nine cars assembled there and came on here at a speed of fifteen miles an hour without any accidents. Arrived in Madrid, a procession headed by the Duke of Santo Mauro, president of the Spanish Club, was formed, and proceeded through the main streets of the city.

As we go to press we learn by telegraph that M. Marcel Renault has succumbed to his injuries.

H.R.H. THE DUKE OF CONNAUGHT has visited Athlone by motor-car from Boyle for the purpose of inspecting the Athlone garrison.

MR. GALLOWAY WEIR, M.P., would like to see motorists lassoed by the police; what is to be done with M.P.'s who make such silly suggestions?

THE Northern Counties Automobile Garage has been opened at 27, Pilgrim Street, Newcastle-upon-Tyne, and every attention will be given to motorists. The garage is open on Sundays, and tyres, as well as other accessories, oils, etc., are kept in stock. Repairs are also undertaken.

MR. R. COATHUPE, of the London Motor Garage Co., Ltd., has worked out some of the times of the cars in the Paris-Madrid race, and has kindly sent us the following statement of the times occupied in covering the 345 miles from Versailles to Bordeaux:—Mors, thirteen started, six finished, in the average time of 6 hours 50 minutes 20 seconds; Mercedes, twelve started, nine finished, in the average time of 7 hours 30 minutes 8 seconds; Pipe, four started, two finished, in the average time of 8 hours 14 minutes 16 seconds; Panhard, sixteen started, nine finished, in the average time of 8 hours 45 minutes 43 seconds; De Dietrich, ten started, six finished, in the average time of 8 hours 46 minutes 16 seconds; C.G.V., four started, three finished, in the average time of 8 hours 55 minutes 40 seconds; Gobron Brillie, five started, three finished, in the average time of 9 hours 9 minutes 52 seconds; Serpollet, seven started, six finished, in the average time of 9 hours 48 minutes 20 seconds.

THE IRISH FORTNIGHT.

DURING the week preceding the race, special arrangements will be made by the London and North-Western Railway Co., for the conveyance of cars between Holyhead and the North Wall, Dublin. Trays are now under construction for the purpose of loading and unloading the cars from dock to steamer and vice versa. The company's ordinary cargo steamers can take about sixteen cars on their main deck, and as three cargo boats leave every day, viz., at 2 a.m., 6.40 a.m., and 6 p.m., except Mondays, when the 6.40 a.m. boat does not run, and Saturdays, when the 6 p.m. boat does not run, no difficulty or delay should occur in getting cars shipped. Early notice of the intention to send a car to Dublin should be given to the Secretary of the A.C.G.B.I., so that the railway company may be informed of the number of vehicles for which provision should be made. Although the passage to Dublin is rather longer than to Kingstown, it must be remembered that the mail boat to the latter port do not carry motor-cars.

ALL secrecy with regard to the car which Mr. Alexander Winton will drive, as one of the American team, in the Gordon Bennett race is now at an end, for this week we are able to give an illustration, together with a few brief particulars of the vehicle, which is to be known as the "New Bullet." The car is quite a new departure, for the engine comprises no less than eight cylinders placed horizontally across the centre of the frame and arranged in two groups of four. The cylinders are 5 in. dia., by 6 inches stroke. The horse-power, however, has not

Mr. Alexander Winton on his Gordon Bennett Racer. [Motor Age.]

been given out. The heads project beyond the side of the vehicle, and they are arranged so that any of them may be removed for inspection or repair by simply taking off a couple of nuts. Above the cylinder heads is the row of eight sparking plugs, protected by a sheet iron slide which may be instantly removed. The cylinders are of cast iron, with aluminium water jackets. All eight of the piston-rods work on to a single shaft which is coupled in the centre. There is but one fly wheel at the end of the shaft and this weighs only 75 pounds, it being claimed that there is no necessity for a heavy fly wheel on account of the steady torque caused by the eight impulses one after another. Between the two batteries of cylinders is the carburettor, which is of the standard Winton touring-car pattern. The speed of the motor can be varied from 100 to 1,000 revolutions. The lubricating system is similar to that on the standard Winton car, there being one lubricating tank supplying two splash boxes, one for each set of cylinders, the flow being regulated by means of wicks. The water circulation is maintained by two centrifugal pumps. Under ordinary conditions the car starts and operates on the high speed, and in this position the drive is direct from the motor to the rear axle by means of a cardan shaft and bevel gear. A slow speed forward and a reverse motion are also provided. The braking system is exceedingly powerful, there being five brakes. There are two brakes on each rear wheel hub and one on the fly wheel of the motor. A pedal actuates the flywheel brake and the innermost ones on the hubs,

while the high-speed lever disengages the clutch and applies the outer brakes on the hubs. The entire mechanism is hung from a wooden frame well trussed with iron bars. The wheels are 32 inches in diameter fitted with 4-inch Goodrich tires. The wheel base of the car is 6 feet 6 inches.

MATTERS are now shaping definitely with regard to the motor-speed trials in Ireland, entries for which must be sent to the Automobile Club, 119, Piccadilly, W., by noon on June 15th. Late entries will be received up to the 25th prox. on payment of entrance fees 50 per cent. higher than those for the earlier comers. Only entries from members of the A.C.G.B.I. affiliated clubs, recognised foreign clubs, or the Auto Cycle Club will be accepted, although the drivers need not necessarily be members of the clubs. Cars fitted with engines giving over 30-h.p. will not be admitted to the tourist section. On another page we give the programme for the various competitions at Dublin, Castlewellan, and Cork.

ENTRIES for the hill-climbing competition at Killorglin, Co. Kerry, will be received up to July 11th, at the Imperial Hotel, Cork. The distance will be about a mile up the hill illustrated

special attention of the magistrates to the necessity for granting licenses. On a division, this resolution was declared lost.

CALLING in at the depot of Messrs. S. F. Edge, Ltd., the other day, we had an opportunity of inspecting a neat Gladiator motor delivery van about to be despatched to Cork to the order of Messrs. Robertson, Ledlie, Ferguson and Co. The vehicle, which has a capacity of 10 cwt., is provided with a 10-h.p. two-cylinder engine, and the chassis has been specially designed to withstand the heavy work to which it will be subject. Altogether five vans are being supplied to this enterprising Irish firm, three for use in Belfast and two for Cork.

THE South Kildare Agricultural Society, Limited, of Athy, write asking us to make known that they have ten Irish acres fully and securely enclosed comprising their show grounds, bounded on one side by the Gordon Bennett Course. These are suitable for camping purposes.

IN addition to the race for the Harmsworth Cup, which is open to any motor-boat not exceeding 40 feet o. a., whatever the horse-power, there will also be races for other boats to be

View of the Hill between Killarney and Tralee, on which the Hill-climbing contest will take place.

in the accompanying photograph, the first prize being the County of Kerry cup.

MR. W. NIXON, of Belfast, who was killed in the Paris-Madrid race, was well known in cycling circles in the north of Ireland. Latterly he had taken to motor-cycling, and took part in a competition at Belfast on Easter Monday. He was one of the first members of the Ulster Centre of the Motor Cycle Union, and out of respect to his memory the Whitsun meet between the Ulster and Dublin Centres has been postponed.

AT the last meeting of the Athy Urban Council, Mr. St. John handed in the following notice of motion for the next meeting:—"That Athy being a great centre of the Gordon Bennett race, and as the town is expected to be crowded with a large concourse of sightseers, the Council will consider what its responsibilities are with regard to the needs, requirements, regulations, and control, and water and food supply, and also call the attention of other Councils to the responsibilities that the great crowds entail." In connection with the recent decision of the magistrates not to grant occasional licenses on the day of the race, Mr. J. B. Deegan, V.C., proposed a resolution calling the

held on Friday, July 10th, for a prize of the value of £10, given by Mr. Norman D. Macdonald, the chairman of the Scottish Automobile Club, and a cup of the value of 15 guineas, given by Mr. E. H. Hamilton. The prizes will be offered for the classes for which there are the most numerous entries, and probably two or three classes will be grouped together to race under the handicap of the Marine Motor Association.

AS an example of the keen interest with which Ireland regards the forthcoming event, a Deputy Lieutenant of one of the Irish counties has called the attention of His Majesty's Judges of Assize to the date fixed for the race, viz., July 2nd, and suggests, in view of the universal desire to see this unique event, that they should arrange that circuits shall not commence until, say, Monday, July 6th. If circuits go on as usual on July 1st or 2nd, many people who are obliged to attend the assizes will be deprived of the opportunity of seeing the race.

AMONG Northern firms able to undertake motor-car repairs are Messrs. Greenhill and Craig, of New King Street, Belfast. Their workshops are well equipped with the latest machine tools, and they have every facility for the re-charging of accumulators, etc.

A SCOTTISH HILL CLIMB.

ON Saturday both sections of the Scottish Automobile Club joined in a series of hill-climbing trials on the Kirkfield Bank ascent from the Clyde Bank, near Lanark. Mr. Stephen Smith, B.Sc., and Mr. Andrew Wilson, A.M.I.C.E., had surveyed the hill, and measured off a distance of 701 yards at the steepest part. The profile showed an average grade all over of 1 in 8.99, while 440 yards had an average of no less than 1 in 7, and near the middle—at a turn—about 100 yards varied between 1 in 5 and 1 in 6. A "flying start" of about 120 yards was given—half of it at 1 in 25, and half at 1 in 18, from which the sharp ascent of 1 in 8 was struck. The duties of the judges were divided as follows:—The Right Hon. Sir J. H. A. Macdonald, K.C.B., Lord Justice-Clerk (President, S.A.C.), took a general oversight; Dr. Blair, of Jedburgh, took charge at the top; and Mr. John Wilson, Edinburgh, at the start; while Mr. Norman D. Macdonald, advocate (Chairman, S.A.C.), regulated matters at the middle of the hill, and took care that no competitor broke

This was done after the trials were over, the car being loaded to a total of 1½ tons. The 701 yards, at an average grade of 1 in 8.99, were then covered in 53 secs., or an average speed of 27 miles an hour.

Of the twenty-eight cars entered twenty-three competed, the following being the official results:

Entrant and Description.	Weight unladen in cwts.	Speed in miles per hour over the 701 yards.	Time taken on run of 701 yards in mins. & secs.
SINGLE CYLINDER CARS.			
A. W. Steven (6-h.p. Argyll)	9	9.43*	2 32 1.5
J. A. Peacock (6-h.p. Peugeot)	6½	7.24	3 18 1.5
TWO-CYLINDER CARS.			
Andrew T. Reid (10-h.p. White)	15	6.43	3 43
H. Prosser (10-h.p. Wolseley)	18½	9.42*	2 32 2.5
W. A. Smith (8-h.p. Argyll)	13	8.1	2 57 1.5
Albion Motor-Car Co., Limited (12-h.p. Albion)	22	6.12	3 54 3.5

Scottish Hill Climb—Mr. C. G. Sinclair on his 20-h.p. Serpollet Car.

the rules by assistance from anyone, or otherwise. Mr. S. Smith, B.Sc., supervised the timekeepers, the telephonic work, and worked out the statistical results. Messrs. Inglis (Edinburgh) and Blair (Glasgow) acted as timekeepers, the former also laying down a field telephone. Mr. J. H. Irons, Edinburgh, acted as starter, and Mr. R. J. Smith, C.A., Glasgow (General Secretary, S.A.C.), as marshal. The Lanarkshire police gave much assistance at all points in the regulation of the large crowds of onlookers, and of the cars generally.

As will be seen from the following, Mr. A. W. Steven's 6-h.p. Argyll was the first of the small cars, its speed being 9.43 miles an hour; in the two-cylinder class, Mr. H. Prosser's 10-h.p. Wolseley attained 9.42 m.p.h.; and in the big cars class Mr. C. G. Sinclair, making the fastest time in the trials, averaged 17.2 miles an hour, on his 20-h.p. Serpollet steam car, shown in the accompanying photograph. Mr. Sinclair, not having had much practice in driving his car, could not run it at its real possibility. Therefore it was arranged to give an exhibition run with it in the hands of his French professional mechanician.

W. Weir (12-h.p. Darracq)	16	3.58	6 40
Ed. A. Brown (10-h.p. Argyll)	13	5.71	4 11 2.5
Robert Forester (7-h.p. Panhard)	16	6.26	3 49 1.5
John Adam (10-h.p. Wolseley)	18½	5.03	4 45
Jas. T. Forgie (7½-h.p. Wolseley)	16	6.34	3 46 2.5
J. H. Mathieson (10-h.p. White)	14½	4.0	5 58
J. Hunter and C. J. Campbell Steen (10-h.p. Wolseley)	18½	8.31	2 52 3.5
H. E. Smith (10-h.p. Argyll)	13	6.63	3 36 3.5
A. U. Barr (7½-h.p. Wolseley)	15	7.06	3 23 2.5

FOUR OR MORE CYLINDER CARS.

Hugh Reid (12-h.p. British Gardner-Serpollet)	34	11.18	2 8 2.5
J. H. Paterson (12-h.p. Peugeot)	17	7.31	3 16 1.5
R. Douglas Croall (10-h.p. Napier)	15½	8.81	2 42 4.5
Geo. Macmillan (16-h.p. De Dietrich)	19	12.14	1 58 1.5
Wm. Weir (24-h.p. Darracq)	21½	13.09	1 49 3.5
W. Holms-Kerr (20-h.p. Wolseley)	23	14.46	1 39 1.5
C. G. Sinclair (20-h.p. Serpollet, steam)	24	17.2*	1 23 2.5

* First in its class.

THE motor traffic on the Cheshire roads on Saturday and Sunday was enormous. Saturday was quite a record day.

HERE AND THERE.

THE King drove to Richmond on Sunday on his new Darracq car.

THE first automobile club in Canada has been organised at Hamilton, Ont., and will be known as the Hamilton Automobile Club.

What the X Rays showed in a Tyre.

[La Locomotion.]

MESSRS. J. ROTHSCHILD ET FILS, LIMITED, inform us that they are constructing for Mr. Harrison Benn, the President of the Yorkshire Automobile Club, one of their special Roi des Belges tonneau bodies, finished in three shades of green, with seating accommodation for six persons, which it is intended to fit to that gentleman's 22-h.p. Daimler.

NOTICES have been prepared by the Minneapolis Automobile Club to be sent to members against whom first complaints may be made for fast or reckless driving. They state that second complaints will be referred to the Board of Trustees, and that if third complaints are made members may be expelled from the Club.

IN connection with our recent article on private motor-car stables, the Keasbey and Mattison Company, of Ambler, Pa., U.S.A., have sent us drawings of the fireproof motor-houses they have recently introduced. They are made in three sizes—10 ft. by 10 ft., 10 ft. by 13 ft. 4 in., and 10 ft. by 16 ft. 8 in., all having a height of 7 ft.

A MOTOR garage in which vehicles to be used for demonstration purposes may be stored will be built at the St. Louis Exhibition by the American National Association of Automobile Manufacturers. The expense of building will be assessed among the exhibitors on the basis of the number of square feet used by each. Foreign exhibitors will also be permitted to use the garage on the same basis as the American automobile manufacturers. The building will have a cement floor, and will be thoroughly protected against fire, but the care of the vehicles must be attended to by the individual owners. There will be all the necessary facilities, such as water supply, electric light, current for charging batteries, lockers for caretakers, and a supply of petrol.

THE Mobile Motor and Engineering Company, Limited, has been registered with a capital of £3,000. The directors are Messrs. M. Lintine (chairman), D. F. Lintine, and L. Antweiler, and the registered office is at Rosebery Buildings, John Bright Street, Birmingham.

IN Cincinnati automobiles are being labelled with the initials of their owners. The letters are 4 inches in height and 2½ inches in width, and must be attached to a plate and placed in plain view.

RHODE Island Automobile Club is making arrangements for the establishment of charging and storage stations in a number of cities and towns throughout the State. Already arrangements have been made in Pawtucket, Warren and Bristol, and within a few days stations will be announced in nearly all the towns visited by local automobilists.

At the present time the motor-cyclist pays a tax of 15s., and the owner of a four-wheeled automobile is mulcted of two guineas. Mr. Norman, M.P., proposes that the tax shall be based on the horse-power, and he suggests 4s. per horse-power as a fair sum. Thus the motor-cyclist with a 2-h.p. bicycle would pay 8s. The owner of a 5-h.p. voiturette, costing about £150, would be charged £1. Next in the scale, the proprietor of a 10-h.p. car would be required to disburse £2.

WE have received a sample of Patcho, a new preparation for the repair of the outer covers and inner tubes of pneumatic tyres without the use of rubber or chalk. Contained in a collapsible tube, it is easily applied, and sets dry and hard in a very short time, making a permanent repair with the slightest possible trouble. For motor tyres it is claimed to be specially valuable, and the makers—Patcho Limited, Bradford—inform us that they have received orders for it from almost every firm in the motor trade.

THE Forman Motor Company, Limited, of Coventry, have just brought out a 20-h.p. four-cylinder petrol motor, of which we give an illustration herewith. The cylinders are 105 mm. diameter by 110 mm. stroke. Although the engine is normally rated at 20-h.p., it develops 24-h.p. on the brake at a speed of 800 revolutions per minute. The reciprocating parts of the motor have been carefully and accurately balanced, and the engine is capable of being accelerated to a high speed without the slightest sign of vibration. The crank shaft is very stiff, and all the bearings and working parts have ample surfaces which ensure long life; notwithstanding this, the motor is extremely light, its weight being only about 350 lbs. Ready facilities are given for

dismounting and examining the moving parts, the base chamber, which is of aluminium, being provided with inspection doors. The cylinders are cast in pairs, and the base chamber is provided with an ample central bearing. The governor is adapted to act on the in-take, each pair of cylinders being governed separately.

MR. C. D. ROSE, M.P., has become the owner of the 12-h.p. Argyll car driven by Mr. Govan in the Glasgow to London non-stop trial.

THE Ridley Autocar Co., Limited, Upper Well Street, Coventry, have taken an adjoining factory in order to extend their facilities for coping with their increasing business.

THE Alresford Automobile Club has just been formed, with Mr. G. R. Shield as honorary secretary. Among the members who have already joined are the Hon. Douglas Carnegie, Sir John Shelley, Bart., and Major W. Nicholson.

THE third monthly run in connection with the Challenge Cup Competition of the Reading Automobile Club will take place on Whit Monday to Savernake Forest (32 miles) and back, via the main Bath Road, starting from the club headquarters at 10 a.m.

THE ILFRACOMBE MOTOR-COACH COMPANY, LIMITED, has been registered with a capital of £4,000, to provide a service for the conveyance of passengers and goods between such places as the company may determine by means of public or private motor-coaches, omnibuses, or other vehicles.

THE Automobile Equipment Company, of Indianapolis, U.S.A., has sent us particulars of a "rain apron" of which it is making a speciality. It is adapted for one, two, or four persons, and is made of best silk rubber, with waterproof collars. It is

made to suit Oldsmobiles, Locomobiles, and Winton cars, the illustration showing it in use on one of the latter. As will be seen, it encloses the steering wheel and various control levers, but how the various passengers get into the apron is not explained.

MESSRS. ELLIOTT BROTHERS, of the Century Works, Lewisham, have sent us a copy of their new catalogue of alternating current instruments, which have been designed for use on single-phase and polyphase circuits.

THE Schiemann system of electrical motor-cars is to be given a trial by the Halifax Tramways Committee. The electric cars take their power from overhead wires by means of a trolley; they do not, however, run on rails, but move with freedom on the road. The Halifax Tramways Committee has ordered one car for experiment, and the outcome will be watched with interest.

WRIDGWAY, formerly well known in cycle and automobile circles in this country, but now in the motor trade in the United States, is coming out as a racer, a match having been arranged between him and another American motorist named Oldfield. It is to take place on a track, and will comprise three races of five miles.

A COURSE of automobile lectures is to be delivered at the Y.M.C.A. at Boston, U.S.A., during next winter. The committee has decided that the course shall consist of forty-eight discourses, bearing on the different types of motor vehicles. It is felt that these lectures, combining not only scientific and educational, but also entertaining features, will meet with general approbation among automobile owners, drivers, and in fact any one interested in the advancement or use of the motor vehicle. Several well known American manufacturers have signified their willingness to participate and give an evening to the cause.

THE Birmingham Motor Mart, 103, 104, and 105, Digbeth, Birmingham, are holding monthly auction sales of motor-cars and motor-cycles.

IN connection with the marching route of the Leeds Artillery during Whitsuntide, Colonel Coghlan proposes to make a trial of motor-cars.

THE authorities of the Northern Railway of France are about to make some trials of steam motor-wagons for the delivery of heavy goods.

MR. W. CONAN, of Kildare Street, Dublin, has been appointed agent for Messrs. J. Lovegrove and Company, the well-known motorists' tailors of Piccadilly, W.

THE Sherlock Chair and Cycle Company, Limited, has been registered with a capital of £5,000, to acquire the business carried on at Lowestoft and Wrentham, Suffolk, as N. A. Sawyer and Company, to adopt an agreement with Messrs. R. Skipper, G. J. Skipper, and F. W. Skipper, and to carry on the business of manufacturers of motors, cycles, velocipedes, and carriages.

THE Automobile Club has resolved to sign and seal an agreement which will secure for the use of the Club a racing track for automobiles. The track, which is to be constructed near Purley, will give a circuit of seven miles. It is close to the Brighton Road, and less than fourteen miles from Westminster Bridge. Both trials and race meetings will, it is contemplated, be held upon the track.

HANS RENOLD, LTD., is the name of a company which has just been registered with a capital of £100,000 to acquire and carry on the chain-making and engineering business of Mr. Hans Renold, Progress Works, Manchester. The first directors are Messrs Hans Renold (governing director), H. V. Herford, and P. C. Webb. We understand that the company is a private one, and that no change will be made in the general management and conduct of the business.

A SHEET of the Dunlop Road Chart has just been issued. It indicates the routes, mileage, contour and gradients of the hills, and description of the surface of all the main roads leading out of London for approximately one hundred miles around. The motorist about to start upon a journey on either of these roads should cut the strip relating to it, and fold it up small enough to fit into his waistcoat pocket, this being an extremely convenient way of carrying the requisite information. The Dunlop Company will send a copy of this chart, rolled up in a postal tube, gratis to any motorist remitting three stamps to cover the cost of postage.

THE Ranelagh Motor Company, Limited, is the name of a new concern which has opened a depot at Ranelagh Parade, Barnes, S.W., close to the Common and to the Ranelagh Club grounds. Among the directors is Mr. A. E. J. Steele, who, it may be remembered, won the *Motor-Car Journal* motor-cycle cup the first year it was put up for competition by the A.C.G.B.I. The Ranelagh Company are keeping a stock of accessories for petrol, steam, and electric cars, a plant for charging the batteries of the latter having also been installed. They have ample space for storing a number of cars, and are equipped for carrying out repairs of all kinds.

THE first of the trials organised by the western section of the Scottish Automobile Club on the lines of the quarterly trials of the A.C.G.B.I., was held recently, the route being from Glasgow through Dumbarton, Helensburgh, over Whistlefield Hill, Arrochar, Ardlui, to Crianlarich, thence back by Ardlui, Tarbet, Luss, Alexandria, and Bowling, to the city—a total distance of 107 miles. Three 12-h.p. Arrol-Johnston cars, one having a six-seated body, took part in the trials. Car No. 1 made a non-stop run on 6½ gallons of petrol; car No. 2 (the six-seated) had two stops on the hill-climb, one due to stoppage of engine, and a momentary one in changing gear—the petrol consumption was 7½ gallons; car No. 3 made a non-stop run on 6½ gallons of petrol.

MOTOR-CYCLING NEWS.

THE Lycett Saddle and Motor Accessory Company, Limited, of Birmingham, have sent us a sample of their new motor-cycle belt and connection, illustrated herewith. The belt itself is of V section, made of raw hide, stretched and run on pulleys before being sent out. A feature of the belt is the provision, at intervals of three-quarters of an inch, of central eyeletted holes, which

it is claimed will not pull out. The connection consists of a U-piece of steel, placed in position by twisting the two ends of the belt so that they lie alongside each other. Should the belt stretch it can quickly be shortened, all that is necessary being to cut one eyelet away and place the connection in the next one. The two ends of the belt are brought close to each other, this being claimed to obviate all possible loss of power.

MOTOR-CYCLING seems to have "caught on" in Wales, and two motor races are announced in the cycling meet at Carmarthen on Whit Monday. Suggestions are being made that the tracks at Cardiff, Pontypridd and Carmarthen should be re-banked so as to make them safer for high speed.

THE new accumulator bag for motor-cycles, recently referred to in our columns as the introduction of Messrs. A. W. Gamage, Ltd., is meeting with favour. The bottom portion is lined with tin to prevent the leather spoiling should the acid be spilled. The top is lined with rubber to ensure perfect insulation.

SOME new motor-cycle records were set up by Mr. F. Chase on the Canning Town track on Thursday of last week. Both the flying and standing starts records for the mile and five miles were beaten, while the ten miles standing was reduced by no less than 23 sec. The following are the new and previous times:—One mile (standing start).—1 min. 15 2-5 sec., previous record 1 min. 23 4-5 sec. (accomplished by Barnes). One mile (flying start).—1 min. 6 3-5 sec., or an average of 55 miles an hour; the previous record was 1 min. 9 3-5 sec., by Mr. Chase himself. Five miles (standing start).—5 min. 57 2-5 sec., previous record 6 min. 7 sec., by Barnes. Five miles (flying start).—5 min. 36 sec., previous best 5 min. 50 sec., by Chase. Ten miles (standing start).—11 min. 35 sec., previous best, 11 min. 58 sec., by Barnes. After doing 13 miles both of the tyres became so worn out that Mr. Chase had to give up any further attempts at record breaking. His time for the 13 miles was 15 min. 6 sec., but he had to slow down very considerably during the last few laps. The machine was a "Bat" with an M.M.C. engine.

THE New York and Alpha Motor Cycle Clubs held a joint run on the 10th inst. The course was from Brooklyn to Patchogue and back, a distance of 117 miles. Out of sixty-eight entries forty-seven started and twenty-nine finished within the time limit. This is considered a good result in view of the fact that the Long Island police were out in force to restrict the motor-cyclists to the eight-mile rate within corporate limits.

IN connection with the 200 miles reliability trial for the S. F. Edge trophy, on June 27, it is understood that it is a reliability and not a speed trial. The awards are—first, trophy value £20; second, gold centre medal; third, silver medal. Certificates

will be given to all members of the Motor Cycling Club completing the distance at an average speed of not less than eleven miles per hour. The route selected is over four out and home courses of approximately fifty miles each, radiating from one centre, situated within 20 miles of London. Competitors will be allowed to dismount for congestion of traffic, but such stoppages must be reported; no adjustments of any description whatever will be permissible. Entries should be forwarded in time to reach the Hon. Sec., Mr. G. E. Roberts, 17, Fieldhouse Road, Hyde Farm, Balham, S.W., not later than first post on Monday morning, June 22nd, accompanied by entrance fee of 5s.

JUDGING from the particulars we have received Whit Monday will be a day of motor-cycle racing. Events for the new machine are included in the programmes of the meetings to be held at Waterford, Tunbridge Wells, Putney, Carmarthen, Slough, St. Albans, Chichester, etc.

THE Motorcycle Club de France is organising a Whitsun tour from Paris to Dieppe and Treport. Perhaps it is a little too early to suggest a joint meeting of the Motor-Cycling Club with its Parisian compeer.

FROM Berlin (Gustav Schmidt's Verlag) comes a little book by Herr Wolfgang Vogel, entitled "Das Motor Zweirad und Seine Behandlung." Motor-bicycles, while a more recent innovation in Germany than in England, are rapidly coming to the front in the Fatherland, and the work before us is the first of the handbooks relating to the motor-driven bicycle that may be expected to make their appearance in quick succession. Herr Vogel appears to have produced a most useful guide; he devotes the first sixty pages to "theory," and in this section describes the action of the petrol motor, the carburettor, ignition, lubrication, cooling, etc., each chapter terminating in a series of questions, the answers to which the reader is recommended to put in writing, in order to the more familiarise himself with the various details. After the theoretical part comes ninety pages of "practical," the use of which is much enhanced by the clearly drawn diagrams accompanying the text. The book is, of course, intended for German motor-cyclists, and is printed in the language of the country.

FROM the chapter on lubrication in the book referred to above, we take what may prove to be a useful hint to motor-cyclists in this country. After a motor-cycle has been run two or three hundred miles, it is sufficient to give a fresh charge of oil to the crank chamber about every 20 to 25 miles. This to the average rider is equal to, say, an hour's run. Taking advantage of this, Herr Vogel suggests a method of converting a watch into a useful

indicator. On the rear side of the glass an arrow should be painted with Indian ink. In most watches the glass is not so tightly fitted that it cannot be rotated by the hand. Thus the arrow may be brought into line with the figure representing the hour, as shown in the illustration, when the crank chamber requires a fresh charge of oil. If the watch be fitted in a carrier on the handle bar, the utility of the arrangement will be increased, the rider having no need to trust to memory as to the time of oiling up.

THE 10-H.P. "KRUPKAR."

WE are this week able to illustrate one type of car which the recently-formed concern known as Krupkar, Limited, is introducing into this country. The vehicle, as will be seen, follows in general outline the standard lines, and is thoroughly up-to-date in every respect. The engine is of 10-h.p., and comprises two vertical cylinders, located under a Mercedes type bonnet with combined honey-

Fig. 1.—General View.

comb radiator and water tank, a current of air being drawn through the cooler by means of a fan. The inlet valves are mechanically-operated, while the ordinary type of electrical ignition is fitted. The governor is adapted to act on the gas admission, and in conjunction with this is a hand "accelerator." The power is transmitted in the usual way, through a pedal-operated friction clutch, gear box, cardan shaft and bevel-

Fig. 2.—Plan of Chassis.

gearing to the rear live axle. Three speeds forward and a reverse motion are controlled by a single lever, the drive being direct on the top gear. Special attention has been devoted to the body work, which is of the most luxurious kind; the road wheels are of equal size, shod with stout pneumatic tyres. The car complete weighs about 16 cwt. and appears to run very silently. The company also expect over in a few days a 16-h.p. 4-cylinder car on similar lines.

THE Bath Rural District Council has passed a resolution in favour of the retention of the twelve-miles-an-hour limit, and the numbering of motor-cars.

MR. W. H. THOMAS, who has been connected with the Motor Manufacturing Company, Limited, Coventry, as chief of the clerical staff, for over five years, has resigned his position.

A VAN driver employed by a Harrogate laundry has been fined 2s. 6d., and 6s. 6d. costs, for unlawfully not keeping a wagon on the left side of the road, so as to allow free passage.

CORRESPONDENCE.

THE IRISH FORTNIGHT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The question of hotel charges in Ireland in connection with the Gordon Bennett race has been receiving a great deal of attention, and I fear many people will be influenced not to visit this country on account of the statements made. I would point out that it is only in the actual neighbourhood of the course that the charges are extortionate; the accommodation here is woefully inadequate, both in quality and quantity, and, taking advantage of the latter deficiency, prices have been put up to absurd figures. In Dublin, however, accommodation can be had on very reasonable terms. Only a few days ago I was able to get excellent rooms for a friend of mine at 5s. a night, the charges for breakfast and dinner being 2s. and 2s. 6d. respectively. The same reasonable policy prevails in Co. Down, Co. Cork, and Co. Kerry, where part of the programme is to be carried out. With the exception of two or three hotels which are specially high class and always expensive, the charges are reasonable, considering the great demand there will be for accommodation.—Yours truly,

R. J. MCCRERY.

INFORMATION WANTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will you kindly give me your opinion as to whose car will most nearly suit my requirements? (1) Absolutely silent. (2) To seat the usual four people. (3) Chain gear (I presume it is the best). (4) Simplicity throughout. I do not wish the car to go more than ten miles an hour—if it will do this without question, it is all I want, but it must climb any hill; as long as it does, speed is no object. No one but a madman wants to go at a quicker pace than he can really enjoy the country he is going through. I quite understand that there are a few childish grown-up people who—while their toy is new—like to cut through the air in an insane manner, just for the novelty of the thing. But how mad? Nothing whatever is gained by pace—save (1) discomfort, and (2) a chilled system.—Yours truly,

VILLIERS LUCAS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I have the advantage of the opinion of your readers regarding the choice of a car of the following character:—a. To seat two, Victoria pattern, with hood and screen for weather protection, neat in appearance, and preferably having no radiator or bonnet visible, simply a dash-board. b. Speed not exceeding 20 m.p.h., but capable of taking long steep hills at half that pace. c. Silence in working, and also when engine is running with car at rest; I mean absolute silence, and not that which is possessed by some so-called silent engines. d. Simplicity of mechanism, so that one can look after it oneself; and means of starting engine from seat.

I am a surgeon, and want it for both practice and pleasure. I often have several visits in a quarter-mile, so it must be easily started, and there is nothing more disturbing than the throb of a petrol engine, when one is examining a patient, hence I am anxious to get a very silent car. Am I asking for the impossible, or can such a car be obtained at a moderate figure. What horse power and type of engine is most suitable?

I have an electric installation, but the price (7d. per unit) puts electricity out of the question for motive power, unless by combined petrol-electric engine.—Yours truly,

W. W. L., F.R.C.S.

STANDARDISATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. Storey's letter in your last issue hits the nail on the head. What a blessing it would be if standard bolts and screws were used by every manufacturer of motor-cars. In the operation of automobiles screws are occasionally lost, bolts broken, or threads stripped, and the repair of such an accident, seemingly insignificant, causes grave difficulties if screws and bolts are not of standard thread. It is evidently impractical to carry duplicates of all bolts and screws on motor-vehicles, and in case of accident on the road it would then be necessary to have a new bolt or screw made to replace the one which was lost or damaged. On the other hand, if all bolts and screws used are standard, a supply of the standard sizes can be kept on hand, and almost any repairs of this nature can be made immediately. Some short-sighted manufacturers are employing screws and bolts with special threads, expecting to thereby monopolise the repair of vehicles of their manufacture. But a little reflection will show the error of this course. Frequently designers of motor-vehicles adopt special threads, because the standard seems to be too coarse, or for other reasons. While there may be excuses for such a proceeding, they are certainly rare, and standard threads, which can be cut with standard taps and dies found in every engineering shop, should always be given the preference. The use of standard bolts and screws not only reduces the chances of breakdowns on the road, but also reduces the cost of manufacture, for they are

turned out in all degrees of finish by special manufacturers at a price much below that at which the ordinary shop can produce them.—Yours truly,
DIE STOCK.

THE MOTOR QUESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It was stated in the *Times* of May 20th that on the previous day in the House of Lords the Marquis of Granby said: "The Chief Constable of one county, Hampshire, reported that he had received thirty or forty complaints as to motor-cars having done serious damage, but in only three or four cases were the police able to identify the drivers; they ran away." Please permit me to say that the noble Marquis's statement was not in accordance with fact. The Chief Constable of Hampshire, in reply to my enquiry, writes: "I have made no report at all on the subject." This should be conclusive. Motorists may expect Lord Granby to express his regret.—Yours truly,

H. STRATTON BATES, Colonel.

RESULT OF THE POSTAL VOTE OF THE AUTOMOBILE CLUB OF GREAT BRITAIN AND IRELAND.

THE result of the postal vote recently taken by the A.C.G.B.I. is as follows:—

Answers to Question I., viz.:—

- (1) Provided that the three following concessions are obtained—
 - (a) Abolition of the specific speed limit,
 - (b) Alteration of the law as laid down in *Sutton v. Mayhew*,
 - (c) Raising of the tare limit,

Are you in favour of identification of motor-cars by means of numbers or names conspicuous when the cars are in motion?

Yes 1,015 votes.
No 463 votes.

Majority in favour of the policy of the Legislative Committee 552

Answers to Question II., viz.:—

- (2) Are you in favour of nothing further being done by the Club at present to promote legislation?

Yes 277 votes
No 964 votes.

Majority in favour of the Club promoting Legislation 687

Answers to Question III., viz.:—

- (3) Are you willing, in exchange for the removal of the specific speed limit, to consent to the following additional restrictions?

- (a) Small and inconspicuous identification plates;
- (b) Certification of drivers;
- (c) An increase of the penalty for automobilists guilty of serious offences, such as giving false names and addresses or endeavouring to avoid identification after causing an accident.

Yes 474 votes.
No 718 votes.

Majority against Lord Russell's proposals 244

There were 45 spoiled papers, and a considerable number of replies were of a qualified character, and accordingly could not be tabulated.

The following is an analysis of the voting by Clubs:—

Name of organisation.	No. of members voting.	Question I.		Question II.		Question III.

POLICE TRAPS.

BETWEEN Snettisham and Heacham, on the road from Lynn to Hunstanton, is a carefully-planned police-trap discovered by Mr. Frank Morris.

GREAT care is necessary in passing through Potters Bar and Cambridge.

THERE is a measured three-quarters of a mile on the London side of Stilton, on the Great North Road.

A SOUTH LONDON motorist sends us word of three traps into which he has fallen recently. One is at Twyford, near Reading, on the Bath Road

another is to be found on entering Maidenhead from Reading, and the third is on the London side of Colnbrook.

THERE is a police trap about three miles from Wetherby, on the road from Borobridge. It is a measured $\frac{1}{4}$ mile of good road, and is slightly down hill. Two men are stationed behind a gate, and another at the top of the hill—all three in plain clothes.

ON the Ross Road, near Abergavenny, there is a measured distance between the telephone posts Nos. 84 and 95.

MR. G. B. WAUGH, of Baildon, advises motorists that on the main road anywhere between Hellifield and Settle there are many traps. Going north there is a measured mile from where the road passes underneath the railway bridge to where it crosses over the railway near Long Preston. There are also in the village of Long Preston two 220 yards which one policeman controls; about half a mile further on towards Settle there is another trap near a barn on the left-hand side of the road. Going out of Settle there is a quarter of a mile from underneath the railway bridge to where the main road passes over the river Ribbles. The police in the district are very strict, and news of cars that they do not catch that are exceeding the legal limit is telegraphed in the hope of their being stopped some miles further on the road. Whitsun visitors please note.

Where no alleged speed is given it is understood to be above the legal limit.

* Motor-Cycle Cases.

AT Winchester, on Saturday, Mr. L. Savory, of 36, Buckingham Gate, W., was fined ten guineas, including costs, for driving his car at twenty-four miles an hour at Kingsworthy on May 10th. He was pursued by a plain-clothes policeman, who caught him up at the George Hotel, where he declined to give his name until the plain-clothes man proved that he was a policeman by bringing a uniformed officer to identify him. While he went away for this purpose the motorist, he alleged, made a rush for his motor-car in order to get clear.

THE Hon. Claude D. Baring, a lieutenant in the Coldstream Guards, has been fined £5 and costs for driving a motor-car at the excessive speed of twenty miles an hour at Finchampstead, Berks. The evidence showed that in order to save a dog the car swerved on to the footpath, knocking over a woman with a perambulator and baby, smashing the perambulator to pieces, and injuring the woman.

CLAIM FOR DAMAGES.

CHARLES WATKINS, a valet, has been awarded £125 damages in the King's Bench for personal injuries received through a motor-car belonging to Mr. Henry J. King, of 138, Piccadilly, colliding on Maidenhead Bridge with a victoria which Watkins was driving.

"SOUND THE HORN."

At Terrington Petty Sessions, G. L. Pidgeon, London Road, King's Lynn, was summoned for being the driver of a motor-bicycle, and neglecting to give due warning of approach at West Lynn, on May 6th. The allegation was that there were two wagons, each drawn by three horses, proceeding along the highway at West Lynn, and defendant, who was on a motor-cycle, overtook them, but gave no warning of his approach. Both teams of horses shied when the cycle reached them, but one of the drivers stopped his team. The other team, however, bolted, and the reins of the two front horses were pulled out of the driver's hands, and the animals turned up Clenchwarton Road, where a man managed to stop them just in front of a large pit. It was also alleged that defendant passed the horses when they were running away, and went off at a great speed. Defendant said he sounded the horn before he reached the horses. He was fined 40s. and 15s. costs.

CLAIM FOR DAMAGES.

MR. JUSTICE KENNEDY and a special jury disposed of the case of Crossley and others v. the Imperial Motor and Cycle Works, on Tuesday. It was an action to recover damages for personal injuries alleged to have been caused through the negligence of the defendants. The defendants denied negligence. Counsel, in opening the case, explained that Mrs. Crossley on the 16th of July last year was driving a pair-horse wagonette in the New Forest, near Lyndhurst, accompanied by Mr. and Miss Furze. The carriage was travelling at a moderate pace, and when it arrived at a point a little to the south of Bramshaw Church a motor-car belonging to the defendants, and driven by one of their servants, approached from the opposite direction. Mrs. Crossley twice held up her hand as a signal for the motor-car to stop, but the driver took no notice and continued to approach, whereupon the horses became unmanageable, suddenly turned round, broke the pole, and bolted, with the result that the three plaintiffs were thrown out, and all were more or less seriously injured. A great deal of evidence having been given by both parties, the jury found that there had been negligence on both sides, and his lordship reserved his judgment.

MOTOR-CAR FATALITY.

BEFORE Sheriff Henderson, in Edinburgh Police Court, Alexander Mack, a motor-car driver, has been remitted to the Sheriff on a charge of culpable homicide, it being alleged that he drove a motor-car in a reckless and careless manner in Dalry Road on Saturday, in consequence of which Elizabeth Weston or Henderson, seventy-two years of age, was knocked down and killed. The motor-car is the property of Captain Ash, Mid-Calder. The prisoner appeared before Sheriff Henderson in Edinburgh Sheriff Court and made a declaration. Bail was asked for, and the Sheriff fixed the amount at £15.

SPEED TRIALS IN IRELAND.

ALL the events in the Phoenix Park, Dublin, on July 4th will be run over a course of one mile and one kilometre—2,853'6 yards—from a standing start, in heats of two cars or six cycles. In the motor-cycle section there will be three classes, five in the tourist section, two in the racing section, and two open events, one a scratch race for a 100-guinea challenge cup, which will be presented to the fastest car, weighing under 1,000 kilos., over the flying kilometre, irrespective of whether the successful car be driven by steam, electricity, petrol, or other motive power, provided it cover the kilometre in under 40 seconds = 90 kilometres, or 55·9 miles per hour; the cup to become the property of the member of an Automobile Club whose car or cars may win it two years in succession. The present holder is M. Leon Serpollet. The other open event will be a race for motor vehicles of any power or weight, propelled by any form of motive power. The winner will receive and become the holder of the challenge cup, provided that if there are not three starters the kilometre is covered in not more than 40 secs. or 55 miles per hour. The cup becomes the property of the owner of the car winning it two years in succession, or three times in all, the present holder being Mr. C. Jarrott.

At Castlewellan, on July 7th, there will be four miles' speed trials for motor-cycles, and in the tourist section a handicap for a trophy, to become the property of the competitor winning it three years in succession. Two events have been arranged in the racing section, and the open event will be a hill-climbing competition for the Henry Edmunds' trophy for cars driven by a spirit internal combustion engine. The distance will be 1,200 yards.

On July 10th there will be contests at Cork for cups presented by the Mayor and Corporation. Various other prizes are offered in connection with these events, and intending competitors can obtain definitions of the classes and further particulars from the Secretary of the A.C.G.B.I.

SERGEANT JARRETT'S VIEWS.

At Woking, G. Pratt appeared to answer a summons for being the driver of a light locomotive drawing a vehicle that exceeded the rate of 6 miles per hour in Ripley Street. P.S. Jarrett deposed that at 5.50 p.m., on May 10th, he saw defendant riding a motor-bicycle with a trailer attached and a gentleman riding in it. He came from the direction of Guildford through Ripley Street, and covered 176 yards in 15 secs., or at the rate of

24 miles an hour. Sergeant Jarrett added the motor-bicycles were getting a greater nuisance than the cars. With their high gears they simply flew through the village. A penalty of £3 was inflicted in this case also.

ACCIDENT AT A RACE MEETING.

A SERIOUS accident occurred in the final of the five-miles motor-bicycle race at Bristol Post Office sports on Saturday, by which two persons lost their lives and several others were injured. The riders left in for the final were T. H. Tessier, London; G. A. Barnes, London; E. Kickham, Bristol; and P. C. Bailey, Bristol. Kickham retired at the end of the first lap through his chain breaking, thus reducing the competitors to three. All went well until the middle of the third mile, when Barnes, who had completed eight laps, was about to pass Bailey, who had completed nine. Bailey looked round, and in doing so swerved his motor on to the upper part of the embankment. Barnes managed to pass him on the outside, but on descending to the lower level of the track his machine slightly wobbled. Bailey immediately cut into him, causing Barnes's machine to skid, and both men and machines were thrown amongst the spectators. Several people were rendered unconscious and were severely injured, but Bailey, who was riding a motor of 2½-h.p. and 110lb. weight, escaped with slight injury to the face. Barnes, who was riding a 2½-h.p. motor, was, however, very badly injured in the face and legs, and was promptly taken to the Bristol Royal Infirmary, as were ten spectators. The sports were abandoned after the accident, and no more motor-cycle races will be held there this season.

ON the 17th inst., the Swiss Automobile Club held a series of flying kilometre races near Geneva. The best time (39 3·5 sec.) was made by M. Perrot on a Rochet-Schneider (heavy car class). M. Duval, on a Georges Richard, was first in the 400-650 kilos category (time 49 sec.), while Duffaux, on a Griffon, was first in the motor-cycle section (47 1·5 sec.).

It having been decided to run motor-cars between Ilfracombe and Lynton and Lynmouth, in connection with the Lynton and Barnstaple Railway, two of the vehicles have arrived at Ilfracombe, and will, it is anticipated, commence running on June 1st. The cars hold twenty-two passengers each, and will run to Blackmore Gate and back, passengers taking the train to Lynton.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, JUNE 6, 1903.

[No. 222.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE action of a French society in petitioning the King of this country to prohibit the Gordon Bennett race because of the laxity of arrangement in connection with the motor-car contest in France must be regarded with anything but pleasure by the sticklers for propriety. Had the society been concerned with the general question of the protection of the public and had taken unto itself the lives of the French public its interference with the Irish event might have been tolerated; but, under the circumstances, we can assure our readers that the holding of the event will not be seriously influenced by outside meddling.

The Leicestershire Club.

THE Leicestershire Club had a very pleasant run on the 23rd ult., the weather being delightful, and the muster a good one. Starting from the Bell Hotel, an old coaching house, the cars proceeded to Oakham by way of Uppingham, which meant travelling along the stiffest road out of Leicester. The cars, however, negotiated the hills well, and even the famous Wardley Hill was successfully surmounted by the whole of the party. Thurnby, Houghton-on-the-Hill, Billesdon, Skeffington, Tugby, and East Norton were rapidly passed, and in very quick time the quiet old Rutlandshire town of Uppingham was reached. Turning to the left without even stopping to glance at the well-known school of the place, the party made, by way of Preston and Manton, for Oakham, where tea had been arranged for at the Crown Hotel. Rather more than thirty sat down to tea, and the company included Colonel Lionel Powell and Mr T. C. King, Vice-Presidents, Messrs. H. R. Harding, J. W. Hemmings, A. McAlpin, R. E. Parker, W. Dalrymple, J. Dalrymple, T. C. Clarke, S. W. Clarke, Hargrave, Orson Wright, V. Oliver, J. Bennett and others. The President of the Club, Mr. E. G. Mawber, started with the party, but was not able to make the whole journey. The return trip was commenced soon after 7 o'clock, the first stage being to Melton Mowbray, passing through Somerby and Burton Lazars. After a short halt at the hunting town a start was made for Leicester, which was reached about 10 o'clock.

The Reliability Trials.

THE following marks will be allotted under the various heads in connection with the Reliability Trials to be held this year: 3,000 for reliability; 1,500 for cleaning, lubricating, etc. (it has been agreed that the total amount of fuel consumed throughout the trials should be measured, and that each manufacturer might adopt any system he pleased for filling his tanks); 1,000 for hill-climbing; 1,000 for condition after trial; 250 for brakes; 250 for steering; 250 for absence of noise; 250 for absence of vibration; 500 for speed on the track; 500 for freedom from dust raising; 250 for re-starting on a hill; 250 for absence of vapour or smoke; 250 for finish and appearance before and after trials; 125 for general cleanliness of motor and gear;

250 for accuracy of horse-power; 500 for fuel consumption in relation to power (the details when formulated to be settled by the Judges and communicated to competitors); and 250 for cheapness.

Side-Slip Competition.

THE first Eliminating Test in connection with the competition organised by the A.C.G.B.I. with regard to side-slip will be held in November, the last day of entry being October 17th. Competitors will have to fit their devices for the contest to a car weighing not less than 15 cwt., and will be required to have pneumatic tyres fitted. In interpreting the results of tests, the design of the car on which the device is tested as affecting side-slip will be considered. Consideration will also be given to the effect of the device upon the speed or resiliency of the tyres or power needed to drive it; the effect upon the road; to the effect upon the life of the tyre; to the liability to dangerous derangement or fracture; and to the price. A contest of comparative merit may be ascertained on a private track, prepared with a coating of slippery, clayey, or other material, and the shortness of S bends between the limits which can be negotiated without material slipping shall give a figure of merit. Long runs on limestone or other natural greasy roads will be arranged for in suitable weather, one suggested being through Miller's Dale, Darley Dale, etc.

The New Petroleum Spirit Regulations.

WITH regard to the new regulations relating to the storage of petroleum spirit, Captain W. B. Lloyd, H.M. Inspector of Explosives, writes us as follows:—"It may be of interest to you to know that the present issue of the regulations was necessitated by the fact that, whereas petroleum spirit for use in light locomotives was exempted from the operation of the Petroleum Acts under the old regulations, and some owners of motor-cars were unable to observe the conditions laid down in those regulations, and a decision had been given by a magistrate that it would not be in order for a local authority to grant a licence under the Petroleum Acts for the storage of such spirit, it became impossible for owners to keep such spirit legally at all. The new regulations, as you will observe, deal with such a case, and motor-car owners, whose 'store houses' do not observe all the conditions, can now obtain a licence under the Petroleum Acts adapted each to the special case in question. This applies more particularly to many such places in London where a motor-car is kept in a coach-house forming part of an old stable and having living rooms over it, originally intended for a coachman." Since our recent comment the regulations have been published in the "Gazette."

Ladies on Tour.

MRS. WOODHALL MARTIN, of Norton Park, Worcestershire, has just completed a motor-car tour on the Continent. She was accompanied by her daughter, and they motored from their midland home to London, thence proceeded to Dover and Folkestone. Having crossed to Boulogne they journeyed along

breaking their journey at Nice, Beaulieu, Monte Carlo, Mentone, and so on. After exhausting the beauties of the Riviera, Mrs. Martin and Miss Woodhull faced north, and set out on their homeward way. Their 20-h.p. Mercedes Simplex climbed the Alpes Maritimes like a bird, only, unlike a bird, it was never tired, and always ready to plume its wings afresh for another flight. After passing through most picturesque regions, but little known to the ordinary traveller, the voyagers reached the main road and motored on *via* Dijon to Paris. Arrived in England the car was unshipped again and the return journey made to London. Here, after a night's rest, the untiring motorists set forth again, and after an easy run found themselves once more gliding up the avenue of Norton Park, Worcestershire, after an absence of some six weeks.

Doctors and Motor-Cars.

IN connection with the interesting question as to the advantages of motor-cars to members of the medical profession, we are glad to give the testimony of Dr. J. E. Thomas, of Bangor, who since September last has driven his car—an 8-h.p. Argyll—over 4,000 miles. The doctor writes:—"When one takes into consideration the rough and hilly roads we have in this district, and the car having been in constant daily use, and in all kinds of weather, throughout the winter months, whilst doing my professional work, without causing scarcely any trouble, I must admit that the car is a thoroughly reliable one. It has also effected a considerable saving in time and money to me as com-

A Young Motorist on Dr. Thomas' Argyll.

pared with a horse and carriage. I have found that with the hood and glass front I am quite independent of the wet and inclement weather. I had no experience of machinery previous to buying the car; I have had no trouble in attending to it myself, and a young lad only is kept to wash and clean it."

A Kentish Club.

AN automobile club is being formed for Kent, which will probably become affiliated to the A.C.G.B.I. The club will consist of a patron, to be elected for life; an honorary president, vice-presidents, treasurer, secretary, and other officers; of honorary members, who shall be elected by the Committee, and exempt from all fees and subscriptions, but who shall have no right to vote at any of the club meetings; of life members, who shall subscribe not less than ten times the annual subscription; of founder members, elected on or before June 30th, 1903; and of ordinary members. The affairs of the club will be managed by a committee, and the annual subscription will be one guinea, with half-a-guinea entrance fee; the founder members not to be liable for this latter fee. The following

have been chosen as the Provisional Committee:—Dr. Firth (Gravesend), Dr. Woodman (Rochester), Messrs. H. Cosh (Gravesend), Shrubsole (Gravesend), Booth Hearn (Rochester), Austen (Detling), Cornell (Tonbridge), Ball (Maidstone), Packham (Ramsgate), and Hallows (Ashford). It has been resolved that the Star Hotel, Maidstone, be the head-quarters of the club for the present. A number of the members of the newly-formed club proceeded in their motor-cars to College Road after the initial meeting, where they and their cars were photographed.

In a Racing Town.

THE splendid roads around Doncaster were much used by motorists at Whitsuntide, and the police seem to have acted with considerable toleration. Staying half an hour at Conisboro—a pretty village a decade ago, but now spoilt by colliery development—we saw a dozen cars pass through, and on the run back to Doncaster eight others came along. In the yard of the Angel Hotel a Lanchester and a 20-h.p. Wolseley were stabled on Tuesday, the latter revealing the presence in the town of a well-known Lincolnshire motorist. Among other visitors to Doncaster were several motorists from Lancashire centres, including the manager of the motor department of a Manchester firm that is attaining considerable distinction in the automobile world.

£2 a month.

SOME people have queer ideas as to business, and from a leading firm in the trade we have received a letter sent by a would-be motorist who wrote in reference to an advertisement of a voiturette. "Seeing your advertisement of a 4½-h.p. voiturette, £100, the very thing I want, but I have not got the ready money at present, having had some lawyer's expenses lately, over the death of my father, and he dying without a will, and I being the youngest son (35 years of age). I expect, perhaps, you will laugh at my terms, the only ones I can possibly make at present, and that is to pay £2 a month until car is paid for, and of course, interest at a fair percentage. Yours truly." We are glad to know that the automobile industry is not in such a bad way that such orders are regarded as acceptable.

The Alarm of the "Vets."

THE quarterly meeting of the Midland Counties Veterinary Medical Association has been held in Nottingham at the Black Boy Hotel, where motorists frequently congregate. At the meeting which followed, the President, Mr. F. H. Gibbings, delivered an address, in which he pointed out that there was a phase of modern scientific development which had a deep concern for their profession. They had already electric trams, which had done away with a large number of horses; but the competition with horses from which most was to be feared was that of motor-cars and mechanical traction. Motor-vehicles were only in their infancy. At present the signs of the times indicated that the manufacture of automobiles for purposes of business and pleasure would develop into a great industry. There could only be one result of this to the veterinary surgeon, and to all persons connected with horses, and that was a disastrous one.

A Coroner's View.

AT the conclusion of the evidence in an inquest recently held near Bishop Auckland, Coroner Proud said that in this case the motor-car had little or nothing to do with the accident, as, if the witness's account was true, the horses became restive long before the car approached them, and the witness, who was with deceased on the wagon, admitted that they had been troublesome before whilst passing a steam-roller. Some people had an idea that a motor-car had no right on the road, but he

thought the time had arrived when old-time prejudices should be put aside. Motor-cars had come to stay. They were the vehicles of the future, and so long as the motorist observed the rules of the road he had as much right on it as a carriage drawn by horses or a cycle propelled by man. They had to be reckoned with, and could not be driven from the road by narrow-minded prejudice, and the sooner drivers of horses came to that conclusion, the better. The reckless motorist deserved no quarter, and the driver of a horse who took his horse upon the road before he had become accustomed to the sights and sounds he would meet there was not the less blameworthy. The jury returned a verdict of "accidental death," and added to their verdict an expression of opinion that the driver of the motor-car was not in any way to blame.

Co-operative Garages.

AN attempt is being made to form a co-operative venture in Washington, U.S.A., among the owners of motor-cars to provide for the care and storage of their vehicles. A certain charge is to be made each month for the service, and if any surplus accrues, it will be returned to the shareholders in the

Economical Motoring.

A PHASE of the problem alliteratively stated as motor-cars for men of moderate means appears in Major Matson's article in a recent "Badminton Magazine," who has come to the following conclusions. The car should have a single cylinder motor of $6\frac{1}{2}$ to 8-h.p., of the slow-running horizontal type. Solid tyres should be fitted. Transmission should be by belt, and the body should be of the tonneau type. These suggestions will probably cause a revival of the discussion begun by Captain Kenneth Campbell's paper late last year. We invite the views of our readers.

Ratepayers and Motor-Cars.

NOR often do we hear of ratepayers' associations concerning themselves with automobilism, and it speaks well for the progress which the movement is making in the metropolitan suburbs when motor-cars become a subject of serious debate in an association formed for the benefit of the ratepayers. The Eltham Association has just instructed its secretary to write to the proprietors of a public motor-car service, which has

The Paris-Madrid Race.—M. Rougier on his 45-h.p. Turcat-Mery Car, on which he finished ninth in the Heavy Car Class (time 6h. 16m.)

shape of dividends. It is hoped by this means to reduce the cost of stabling vehicles. There are many places in this country where a similar plan could be successfully carried through. It only needs a little careful selection of the original ten or a dozen members of the syndicate, a spirit of mutual helpfulness, and a wise selection of the scene of operations, to make the idea a success.

25 Miles per Hour.

MR. BAKER, the general manager of the London County Council Tramways, has hopes of an increased speed for the tramways under his jurisdiction. New cars are shortly to be provided capable of a speed of twenty miles an hour, and in the open parts of the Kennington, Greenwich, and Clapham roads he sees no reason why twelve or thirteen miles an hour could not be run with safety, and has told an interviewer of the twenty-five miles per hour allowed in New York. If tramways are thus to be allowed to move so rapidly, why not automobiles? In many provincial towns the speed of tramways is already greater than any motorist would care to attain in congested thoroughfares, and doubtless the regulation of the two classes of traffic will have to be considered in conjunction with each other.

been established between Eltham and Lewisham, asking them to consider the advisability of having a stated time for their first journey each day, and also as to the wisdom of inaugurating a service of motor-cars to Woolwich and other adjacent suburbs. There is no doubt that if motor-car services are to become a financial success, the promoters will have to issue time-tables and strictly adhere to them. This is being done at Hemel Hempstead and elsewhere, and should certainly be imitated by those responsible for the many public-service vehicles now running in and about the metropolitan area.

Speed Regulations in New York.

WHAT is known as the Bailey bill, providing for the regulation of motor traffic in New York State, came into force on the 15th ult. Every owner of a motor-car in the State must within thirty days from that date file with the Secretary of State, Albany, a statement giving his name and address, and a brief description of the vehicle, including the maker's name and the number of the car, a fee of one dollar being charged. Every person hereafter acquiring a motor-vehicle must make similar application within ten days from date of receiving same. Every person desiring to operate an automobile as mechanic, etc., must within thirty days file with the Secretary of State a statement

giving his name and address and description of vehicle he is able to operate. All the above classes will be duly registered and have issued to them a registration certificate which must be constantly carried when driving. The registration number for a car must be carried at the back of the vehicle in black numerals not less than three inches high, and stroke not less than one half inch on white ground. Certificates must be shown to police officers upon request. There is no speed restriction in the open country, but boards of supervisors of any township may fix the limit as they desire, but not below 20 miles per hour. Towns and cities may adopt ordinances fixing the speed limit for densely built districts at not less than eight miles an hour, and for sections in which buildings are more than 100 feet apart at not less than fifteen miles an hour. Speed must always be reduced to eight miles an hour (1) in passing pedestrians or domestic animals being driven on the highway in either direction; (2) in passing a public school during school hours; (3) within a distance of one-half mile of any post office, provided the local authorities erect at the limits of such districts, signboards with an arrow indicating the direction and the words "Slow down to eight miles"; speed must also be reduced to ten miles an hour in passing a church on the Sabbath during the usual hours of worship, and to four miles an hour in crossing a dam or causeway where the road is less than twenty feet wide.

New Scotch Works.

On Friday week the Albion Motor-Car Company, Limited, formally opened their new factory at Scotstoun, Glasgow, in the presence of a large number of guests, who were met at Scotstoun Station and conveyed to the works in motor-cars. There they were shown round the new premises, the plan of which was much admired. The rough material is brought in at one end, carried through the machine shop and produced at the other end in the form of completed cars. The pneumatic automatic hammer attracted much attention among the visitors, as also the numerous automatic tools. Mr. John Adam, chairman of the western section of the Scottish Automobile Club, formally declared the works open and wished the company every prosperity, which was acknowledged by Mr. T. Blackwood Murray, B.Sc. Further particulars of the works will be given in a later issue.

Sensational Stories.

It would appear that writers for the newspapers, as well as the correspondents admitted to the columns of the press, have been affected by the recent outburst of summer. Hardly a day passes when the motor-car fails to fill the placards, and scarcely a newspaper can be seen without some exaggerated view of the dangers that lurk in the car. Sensationalism may sell the evening journals, but such methods should not be imitated by the staid organs that seek to influence public opinion, and we would ask our journalistic confreres to realise their responsibility in the matter and consider whether they are not doing a grave injustice to an industry that has too long been regarded with prejudice.

Comparison of Fatalities.

FROM the report of the Commissioners of Police for 1901—no later official figures are available—light locomotives were responsible for one fatality in London in that year, whereas 186 persons were killed by vans, cabs, carts, private carriages, and tramcars in the same period. Such statistics demonstrate the hollowness of the charges made against automobiles as machines of destruction.

The Lincolnshire Club.

THE Lincolnshire Club is likely to have an interesting season, and monthly runs are being arranged. Invitations to the Club have been accepted from Captain Cole, Northolme Hall; Major Errington-Josse, Grimsby; Mr. G. Linnell, Market Deeping; Dr. Gilpin, Bourne; Dr. Hancock-Stoil, Colsterworth; and Sir Hickman Bacon, Bt., Thonock Hall, Gainsborough. A

special meeting of the Club has been held at Sleaford, under the presidency of Sir H. B. Bacon, when a suggestion that the committee should communicate with the whole of the provincial clubs, with a view to arranging a scheme of federation, was adopted.

The Reading Club.

THE third of a series of five monthly runs in connection with the Reading Club's Challenge Cup Competition for reliability, took place on Whit Monday to Savernake Forest, Wilts., and back, via the main Bath Road (64 miles). The weather and the road were perfect, and the run was keenly enjoyed by the participants. A picnic was arranged in connection with the run, and the members and their friends taking part enjoyed their luncheon beneath the shade of the stately oaks and beeches in the Forest. The homeward journey was reserved for the cool of the evening. Amongst those taking part in the run were:—Messrs. E. J. Wickens (20-h.p. Pipe), Dr. Claude Truman (9-h.p. Prunel), G. L. Brigham (Mabley), Dr. Major (Baby Renault), A. C. Brewerton (8-h.p. M.M.C.), Skurray (Accles-Turrell), C. H. Dodd (8-h.p. Renault), Phillips (Enfield motor-cycle), Albert E. Newion (De Dion tricycle and trailer), and Mr. A. H. East (8-h.p. Corré) with the club president (Dr. Walters) on board.

Why not the Catapult?

SIR RALPH PAYNE-GALLWEY, Bt., the gentleman who has kindly suggested the use of shot guns in connection with the Anti-Automobile Campaign, would be a capital commandant of the brigade. Not only is he the author of "Letters to Young Shooters," but he is a first-rate sportsman, and a good shot. But it appears somewhat strange, seeing how old-fashioned are his views with regard to motorists, that he did not advise the use of the catapult, upon which subject he is an acknowledged authority. Only a fortnight ago a volume of his was published on the Crossbow, with a Treatise on the Catapult of the Ancients. Sir Ralph Payne-Gallwey at the head of a band of bucolic youngsters armed with catapults, would be a valuable adjunct to Sergeant Jarrett's forces in Surrey.

LORD KINGSTON has become the owner of a Horbick motor-car.

A MOTOR-CAR service between Salisbury and Amesbury and the Camps will be started in a few weeks.

ON Monday the second meet of the Norfolk club was held at Sheringham. Between thirty and forty cars were present.

THE members of the Manchester Club paid a visit to Astle Hall, Chelford, the residence of Colonel Dixon, J.P., Chairman of the Cheshire County Council, on Saturday. About twenty cars and some seventy members and friends responded to Colonel Dixon's kind invitation. The weather was all that could be desired, and the excursion will long be remembered by all members who were fortunate to take part in it.

ON Wednesday at the South Western (London) Police Court, Edwin Nicholls, a motor-car driver, of South Kensington, was charged with being drunk during his employment and committing damage to a hansom cab. After hearing the evidence of Thomas Tildesley, an officer of the R.S.P.C.A., and a lady who said she narrowly escaped being run over, the magistrate said the prisoner ought to consider himself extremely fortunate that he was not standing in the dock on a charge of manslaughter. It was necessary, considering the fearful risks that the public were exposed to by the furious driving of motor-cars, that when a driver was found to be drunk he should be made an example of. He sentenced him to a month's imprisonment. Mr. George Bell, representing Mr. Hargreaves, the owner of the car, subsequently asked his worship to reconsider his decision, remarking by the way that the car cost £700; but the magistrate refused.

Automobile Demonstration at Hertford.

The Scene in the High Street at Hertford.

IN response to an invitation from Mr. C. Kenneth Murchison, the Mayor of Hertford, a number of motorists journeyed to the county town on the 28th ult. for the purpose of demonstrating the advantages of the motor over the horse. in a series of brake tests. These took place in the main street of the town, before a large and enthusiastic crowd of spectators. Proceedings commenced with a luncheon, over which the Mayor presided, and at which nearly one hundred guests sat down. After the usual loyal toasts, the chief constable of Herts, Col. Daniel, proposed the toast of "Automobilism," remarking that the motor had a great future before it. He thought the County Council was opposed to the retention of the speed limit, and suggested that only those vehicles should be numbered the drivers of which had been fined.

Mr. Scott Montagu, M.P., in replying, thanked His Worship for his hospitality, and stated that after all they must admit that they were a great nuisance on the main highways, especially in dusty weather.

In responding to the toast of his health, Mr. Murchison expressed his pleasure at the opportunity afforded him of welcoming the members of the Automobile Club, and hoped that the Hertford demonstration would be as useful to the industry as insensate motor racing was the reverse.

After luncheon several brake tests took place between horses and cars, the latter being naturally able to pull up the quicker. A ride round the town; more brake tests on a steep hill; and tests of skill at driving completed an enjoyable afternoon's sport. All the arrangements were in the capable hands of Mr. Basil Joy.

Amongst those present were Mr. Ernest Owers, 16-h.p. Napier; Capt. Deasy, 22-h.p. Rochet-Schneider; Mr. Forge Benz; Mr. Kenyon, 7-h.p. Panhard; Mr. W. J. Peall, 12-h.p. Daimler; Mr. Brown, on a Brown car; Mr. Wooldridge, Lancaster; Mr. Cordingley, 40-h.p. Mercedes; Mr. Weller, 14-h.p. Prunel; Mr. Blomfield, 9-h.p. New Orleans; Dr. Barnes, 9-h.p. Daimler; Mr. Fielder, 8-h.p. De Dion; Mr. Munn, 10-h.p. De Dion; Mr. Rockford, 10-h.p. Wolseley; Dr. Brittan, 7½-h.p. Wolseley; Capt. Kenneth Campbell, Lancaster; Mr. Beeton, 7-h.p. Panhard; Mr. J. M. Martin, 10-h.p. Wolseley; Mr. A. Stippy, Dennis; Mr. Gilbertson, steam car, etc. There were also present a number of other members of the Automobile Club, who came down on friends' cars or by train.

THE Edinburgh Motor Omnibus Syndicate, Limited, has started a service of omnibuses. The first route to be opened up is the important one from Preston Street to Haymarket Station, via the Bridges, the General Post Office, and Princes Street. The end to end fare is 2d., with intermediate 1d. stages. The omnibuses have been constructed at the Granton Harbour works of Stirlings' Motor Carriages (Limited).

THE municipality of Hartford, Conn., was the first to adopt electric petrol wagons and ambulances, and the Chief of Police is authority for the statement that the cost to the Police Department for one year has been about 50 per cent. of that for maintaining horses during the last year they were used. He also says there were further benefits because of instant readiness for use and the higher average speed of the motor-vehicles.

D

MOTOR-CYCLING NEWS.

A MEETING of motor-cyclists was held in Stuttgart on the 24th ult., when the formation of the Deutsche Motorradfahrer Vereinigung (German Motor-Cyclists' Union) was decided upon.

Now that water-cooled motor-bicycles are coming into use, special accessories in connection therewith are naturally making their appearance. Thus we are this week able to illustrate a combination water tank and radiator for use on

machines fitted with water-cooled engines, which has been put on the market by the Aachener Stahlwaarenfabrik, of Aix-la-Chapelle. As will be seen, the water tank is of such a form that it fits in the angle of the frame formed by the top bar, the head and the lower cross tube, being fixed by clips round the two first-named members. The radiator, which is connected to the tank by unions, is fitted in front of the head of the machine.

In connection with the Cambridge University Automobile Club, which has a membership of about fifty, a number of motor-cycle races were held on the Clarence Park track, St. Albans, a few days ago, motor-cycles only competing. For the ten miles scratch race there were five competitors, Mr. Lascelles winning in 19 min. 23 sec. Mr. Moore-Brabazon won the flying mile scratch race in 1 min. 31 sec. A five miles' handicap was won by Mr. Hart Davis.

THE Catford Cycling Club's seventeenth annual hill-climb will be held this year on July 4th, at Westerham Hill, Kent. The proximity of the date to the Gordon Bennett Cup race is somewhat unfortunate, but it will give an excellent opportunity for private owners of "pet" motors to score in a big event. The contest will be divided into two classes: Class I., machines up to and including 114 lbs. weight; and Class II., up to and including 170 lbs. weight; allowance being made for petrol and oil. Last year's event was keenly contested, and enquiries so far this year give promise of a record entry.

THE motor-cycle section of the Austrian Touring Club held a race meeting on the Prater track in Vienna on the 21st ult. The 100 kilometre race was won by Herr Wondrich on a $2\frac{1}{2}$ h.p. Laurin-Klement, covering the distance in 1 hour 27 min. 21 $\frac{1}{2}$ sec. This rider also headed the list in the flying kilometre event, his time being 50 sec. The winner of the 10 kilometre event was Herr S. Eckerl on a $2\frac{1}{2}$ -h.p. Puch (time 9 min. 18 sec.).

THE first motor-cycle road race in Australia is to be held on the 22nd August next. The route is from Warrnambool to Melbourne, a distance of 165 miles.

A COMMITTEE meeting of the Ulster Centre Irish Motor-Cycle Union was held at Belfast last week, when a vote of condolence with the relatives of the late Mr. Nixon, killed in the Paris-Madrid race, was passed. Out of respect to his memory the amalgamated run between the Dublin and Ulster Centres, arranged to take place on Saturday last at Rostrevor, was postponed to the 20th inst. The committee recommend that no

motor-cycle races be held in future on the Ulster, Celtic, or Balmoral tracks, and expressed the opinion that the only suitable places in Ulster for such events are the Glentoran new track and the Ballymena cement track.

OF the fifty motor-bicycles which started for Bordeaux in the Paris-Madrid race the following fifteen arrived:—

No.	Name.	Machine.	Time.		
			h.	m.	s.
1.	Bucquet ...	Werner ...	8	55	1
2.	Demester ...	Griffon ...	9	30	44
3.	Jollivet ...	Griffon ...	9	25	54
4.	Cissac ...	Peugeot ...	9	39	36
5.	Lanfranchi ...	Peugeot ...	9	40	40
6.	Derny ...	Clement ...	10	23	23
7.	Griet ...	Griffon ...	10	43	46
8.	Momo ...	Peugeot ...	11	3	20
9.	Maillart ...	Werner ...	11	9	18
10.	Prost ...	Doze ...	11	42	53
11.	Arnot ...	Werner ...	12	5	20
12.	Martel ...	Griffon ...	13	11	2
13.	Barret ...	Bruneau ...	13	59	
14.	Coudere ...	Peugeot ...	15	41	16
15.	Preudhomme ...	Denis ...	20	8	

It will be seen that the fifteen machines comprise three Werners, four Griffons, four Peugeots, one Clement, one Doze, one Bruneau, and one Denis.

At Carmarthen, on Monday, Bert Yates won a five-mile motor cycle scratch race in 7 min. 28 4-5th sec., T. Tessier being second. G. Hitchcock won a ten-mile handicap at St. Albans on the same day, on a New Hudson machine. The Whit-Monday motor-cycling events on the Putney track were somewhat of a fiasco. F. W. Chase and C. F. Barden were to have ridden a series of matches, but the Auto Cycle Club had declined to permit the race. Instead, Mlle. Jeanne Merveaux gave a couple of exhibition rides, a flying two miles being ridden in 3 mins. 4-5 secs. The performance was not regarded favourably. A track record was claimed for a mile ridden in 1 min. 20 secs. by M. Longdon.

J. F. CRUNDALL was the victor of the motor-cycle races on the Canning Town track on Monday. With 10sec. start he was first on his Humber in the five miles handicap; S. C. Hill (25sec.) being second, and H. J. Trow (3min. 40sec.) third. Time, 9min.

Messrs. Flamand and Elskamp and their $2\frac{1}{2}$ -h.p. Minerva Motor-bicycles.—The winners of the Motor-Cycle Section of the recent Circuit National Belge.

44sec. In a three miles match, Crundall beat H. A. Collier by 100 yards. Time, 3min. 54 2-5sec. Crundall also attacked the motor mile record, but failed, his time being 1min. 22sec.

MR. J. VAN HOODYDONK has just supplied a Phoenix motor-bicycle to Mr. H. C. A. Goodall, the Superintendent of Government Telegraphs at Agra.

CONTINENTAL NOTES.

"BY AUTOMAN."

BY the time these lines appear in print, Marcel Renault will have been in his grave almost a week. As everyone knows by this time, he never regained consciousness after his accident at Couhe-Verac, but lingered on for some days and then passed away, surrounded by his family. The accident which resulted in his death was caused in the following manner. For some little time he had been pressing Thery and seeking for an opportunity to pass him; they were just approaching a bad turn in the road, which was being taken care of by a flagman, whose duty it was to warn the arriving cars of the same. Thery saw the danger signal and also the curve, and slowed down, whilst

The car, stopped in its headlong course, turned over and round, mowing down a tree on its way.

Of all those connected with automobilism in France, perhaps the Renault brothers have been the most universally liked. They came into the automobile industry in a peculiar manner. Their real business is in cotton cloth. But in the early days of the motor industry they amused themselves by making a little car with a 3½-h.p. motor. This vehicle was so successful that they were induced to purchase De Dion motors, and make a series of little cars. The Paris-Bordeaux race in 1901 brought the Renaults a great deal into evidence. Everyone remarked how regularly their little cars ran. If I remember right, they all came in together at Bordeaux. In every race they went in for, they seemed to do better and better, until the climax of their

PARIS-MADRID RACE—SNAPSHOTS AT TOURS.

Marcel Renault saw nothing but Thery's dust, and not knowing the reason of his slowing down took the opportunity to pass him. Taking a wide sweep in order to avoid colliding with Thery, he came on the bend in the road before he was prepared for it, and ran on to the grass at the side of the road, where trees were planted at intervals, and where trenches had recently been cut around the trees in order to be able to water them. Not being aware of the trenches, Marcel Renault did not stop, but only let up the accelerator and slowed down slightly, as he saw no danger in running with two wheels on the grass. His front wheel, however, got into a trench and dashed into the opposite side, which was made at a sharp angle. The shock at the terrific speed he was going at burst the tyre at the point of impact and smashed the wheel.

success came when Marcel Renault surprised the whole world by winning the Paris-Vienna race last year, beating all the big cars.

THE Renault brothers are quite young men, and a most united family. Marcel was only 31 years of age, tall and slight, with a sandy beard, and with a retiring, modest manner, which made him sympathetic to everybody. His funeral took place on Saturday last in Paris, and at the service, which was held at the Church of St. Augustin at 11 o'clock, everyone belonging to the automobile world in France was either present or represented. It was a demonstration worthy of a victim in the cause of progress, cut off just at the time when he was beginning to reap the full benefit of his courage, intelligence,

and perseverance. It must be a great consolation to his family that he has not died in vain, and that the automobile industry of the future will carry the indelible mark of his life and labour.

◆ ◆ ◆
TOURAND, the driver of the car which was the subject of the accident at Angouleme, where the mechanic Normand met with his death, has returned to Paris and is quite better. This accident occurred through the faulty organisation of that part of the road and the reckless imprudence of the spectators. It seems that at the point in question no one was keeping the road. A child was playing in the middle of it, and the spectators around were laughing at its antics, when Tourand came along at

bits. The mechanic was killed, and Mr. Loraine-Barrow seriously injured. The fourth and last fatal accident occurred to the Wolseley car of Mr. Porter, and was also caused by faulty organisation, or, to speak more correctly, by the failure to do his duty of the person who had been detailed to look after the dangerous curve leading to a level crossing at Bonneval. Mr. Porter saw the level crossing too late, and in trying to stop, ran into the wall of the house belonging to the crossing keeper, and his car turned over, pinning the mechanic Nixon beneath it.

◆ ◆ ◆
I HAVE given a succinct account of the fatal accidents, and they total up, unfortunately, to six deaths, divided as follows:—1 driver, 3 mechanics, and 2 spectators. The causes of the

a high rate of speed. Seeing the child, Tourand swerved and put down on brakes in order to avoid it, with the result that the car was thrown off the road and into the spectators, of whom two were killed and one dangerously wounded. The mechanic of the car was also killed.

◆ ◆ ◆
THE accident to Loraine-Barrow occurred just after he had left Libourne. It was caused by a dog, which rushed out in front of the car. The axle of the vehicle is very low, and the steering bar, which joins the wheels together, is in front of the axle. The dog, after being struck by the car, jammed the steering gear, and the vehicle plunged into a tree and was smashed literally into

accidents may be summed up as follows:—1 caused by a dog, 1 caused by the spectators, 2 caused by insufficient marking of the turnings, and 2 by neglect of the observers. It is, of course, very easy to talk after the event and say what should have been done, and there is no doubt whatever that, if proper precautions had been taken, nearly all the accidents could have been prevented. For instance, if the turning at Couhe-Verac had been treated with tar, Marcel Renault would have seen it, for it would not have been hidden in the dust of Thery. Notices should have been put up before the race, that all dogs must be kept on the chain, subject to severe penalty. Had this been carried out, Loraine-Barrow

would not have been lying in the critical state he is, and his mechanician would still be alive. The accident to Tourand would not have occurred had stricter measures been enforced to keep spectators back. But all of this theorising after the event is of little use, and the question that presents itself, is: What influence will this disastrous race have on the trade? The readers of the *Journal* will have judged from time to time by these notes that I have steadily advocated road racing, and now that things are becoming re-established to their just proportions, and the thrilling headlines and ridiculous exaggerations of the halfpenny papers have become a thing of the past, the time has come to reason matters out calmly. Without road-racing, the automobile industry of to-day could barely be said to exist. Year after year we have been told that the racers were monsters unsuitable for anything except a mad rush from start to finish of the race, with just enough strength to carry the distance and then fall to pieces or be sent back by train as a useless mass. Year by year I have combated this absurd theory, and shown that the racing car of to-day is the touring car of to-morrow, and I have no hesitation in affirming that this has proved to be absolutely true. Almost every improvement in motor-cars which has become classic has been brought to the fore by its powers of resistance or by its undoubted advantages in comparison with other cars in the only real possible test, that is, an end-to-end race. I think it is hardly necessary for me to enter into details on this subject, but I might point out what an enormous progress has been made in tyres, all on this account; how the stamped steel frame originated by the Cannstatt-Daimler Company has become classic and has replaced armoured wood. These two illustrations will suffice; but I could go over the present touring car piece by piece, and find the same to be true in nine cases out of ten. If it were not for road-racing we should be still where we were five or six years ago, with the 12-h.p. engine, and a car weighing 30 cwt. or more, dangerous in the extreme, unmanageable down-hill, and subject to the great danger of running back on inclines; whereas to-day we can have a good, substantial touring car weighing under a ton, with anything between 20 and 40-h.p. available.

THAT road-racing proper is as dead as Queen Anne is patent to everybody, that is to say, at least, on the scale of the late Paris-Madrid race, but if it be not replaced by racing on a long track the motor industry will stay practically where it is now, or make but very slow progress. The one incentive to skill in choosing the correct materials and in placing them in economical and suitable positions, and getting out of them the greatest possible result, will be gone, unless those at the head of the automobile movement bestir themselves and organize large autodromes where racing can be carried out under proper conditions and under guarantees against the imprudence of the public.

WITH regard to the victims of Paris-Madrid there remains little more to be said, except that progress always claims its victims, and, sad as it may be, it is the inevitable history. It should not for one instant cause us to deviate from our work of popularising and consolidating the self-propelled vehicle. I was talking the other day to a railway official on the subject, and he was telling me of the press campaign and the vapourings and the attempts to stop the movement in favour of railways, when in 1845, or thereabouts, the terrible accident of Versailles took place, which resulted in a holocaust of 150 victims. The campaign against the holding of the Gordon Bennett race will at any rate receive no echo on this side of the Channel, where it is looked forward to with the same enthusiasm as it was a fortnight ago.

A DISGRACEFUL incident occurred in connection with the Paris-Madrid race, in which two Englishmen, whose real names it would be interesting to know, took part. They were driving in a yellow car near Chartres, when they came upon a child in the middle of the road. They put on the brakes and stopped the car in time to miss the child. The passers-by, as is frequently the case, shouted after them and threatened them with proceedings. So far there is nothing to be said; but two witnesses of the event,

the Count Edgar de la Briquardiere and M. Victor Brazon, volunteered to give evidence in favour of the two Englishmen, and drew up a document, which they signed themselves, and in which they stated the facts of the case. The Englishmen, to whom these Frenchmen were rendering such a gentlemanly service, gave the false and ridiculous names of "Doctors Probe-Bladder" and "Funny Yeoman," and the document appears in the "Auto," which has printed it in all good faith. It would be interesting to know the real identity of these two English "gentlemen."

HIS HIGHNESS the Grand Duke Michael Alexandrovitch has become the honorary president of the Automobile Club of Russia. Founded a year ago, the Club has already a garage and repair shop in St. Petersburg entirely reserved for the use of members.

IN the French Senate, on Friday last week, M. Le Provost de Launay asked M. Combes to take fresh measures to prevent accidents caused by motor-cars. He declared that the existing regulations were not and could not be observed. M. Combes replied that a commission of experts would be appointed to examine the question, and he would be guided by its advice in proposing further legislation.

UNDER the patronage of the Crown Prince of Sweden, another automobile club has just been formed in Sweden. There are now two clubs in the country—Gothenburg and Stockholm.

THE Dutch Automobile Club is organising a tour of Holland to be held this summer, terminating with an automobile fete at Apeldoorn.

THE Automobile Club of Namur-Luxembourg, is organising a race meeting for the 17th and 18th inst. On the first day there will be a series of flying kilometre races on the Namur-Huy road between Gires and Ban, while on the 18th inst. there will be a hill-climbing competition at Huy over a kilometre course having an average gradient of $8\frac{1}{2}$ per cent.

AN automobile meeting is to be held at Munich from the 4th to the 8th of July. On the first day the motorists will be received by Prince Ludwig Ferdinand of Bavaria; on the 5th there will be a run to the Nymphenburg Castle; on the 6th a run to Starnberg; on the 7th one to the Taubenberg, and on the 8th, one to the Bavarian highlands.

MANY Austrian automobilists having complained lately of the inconvenience they are put to while driving in the country by the antics of dogs, a notification has been issued calling upon dog-owners to do all in their power to prevent accidents, and threatening them with punishment if they refuse to look after their dogs. Even if a dog runs after a motor-car, its owner is liable to be prosecuted. The police are authorised to inform all dog owners of the risk they run by disregarding the order.

CONSTERNATION reigns among Leipzig motorists owing to the issuing by the Leipzig municipal authorities of a regulation prohibiting automobiles from using any public roads in the neighbourhood of the city. At a meeting of the Leipzig Automobile Club it has been decided to appeal to the Courts against this prohibition. The meeting claimed that it is not right to make many suffer for the faults of a few scorchers who have been the cause of the prohibition. It is urged that such measures must impede the development of the automobile industry in Germany, and that as the military authorities of every civilised State have adopted the automobile, the time may come when Germany will be placed at a disadvantage through having at her disposal less perfect machines than those possessed by other countries.

IN consequence of the unfortunate result of the Paris-Madrid race, the question as to whether the Circuit des Ardennes shall be held is under consideration. The Baron P. de Crawhez has suggested that it be postponed to the end of July and that not more than forty cars be allowed to compete. He also recommends that the course, which is over sixty miles in length, should be roped off and closely guarded. No decision has, as yet, been arrived at by the A.C.B.

THE IRISH FORTNIGHT.

THE Countess of Dudley, wife of the Lord Lieutenant of Ireland, left Rockingham, co. Roscommon, on Monday for a tour in Connemara. Her Excellency and party travelled by motor-car to Castlereagh, where a special train was waiting to convey them to Westport. The motor-car tour was then resumed through Connemara to Recess, where they remained for the night.

MANY events will be crowded into the earlier portion of the Irish Fortnight, and there is just a fear that this is being rather overdone. Certainly it is to be hoped that nothing more will be arranged in the way of trials than has already been approved by the A.C.G.B.I. The great race will be run on Thursday, July 2nd; on the Friday a motor-cycle gymkhana with three events will be held in the Phoenix Park, Dublin, where speed trials will take place on the following day, the entries being divided into three classes for machines up to and including 70 lbs., 114 lbs. and 170 lbs. respectively. The four-mile time test and hill climb will

hurry to return if they are fleeced unmercifully. Thus one object of the projected motoring fortnight, the opening up of Ireland to touring automobilists, would be defeated. On this point Mr. Mecredy has sent us an interesting letter, which was published in our Correspondence columns last week, and at a meeting of the hotel proprietors of the South of Ireland a resolution of protest against the reports that have been circulated in the English Press that the hotel charges will be excessive during the period of the automobile race for the Gordon Bennett Cup has been adopted. The Tourists' Information Bureau, of 6, Westland Row, Dublin, is acting as agent for many motorists visiting Ireland in connection with hotels and apartments.

THE City of Dublin Steam Packet Company are conveying motor-cars from Liverpool to Dublin for 35s. at owner's risk up to 50 cwt. Forty cars can be carried in any of their steamers, and in the new steamer "Kilkenny" they will be able to carry about sixty. It will be well for those who propose to forward cars to Dublin to advise their Liverpool agent, Captain Bell, as

The Earl of Dudley, Lord Lieutenant of Ireland, on his Panhard Car.

(Lafayette, Dublin.

take place on the Clough-Castlewellan road, Co. Down, on July 7th, and the County Council has unanimously agreed to the closing of the road from public traffic on that date.

MR. J. E. HUTTON has issued a large scale map of the Gordon Bennett Race Course, together with a key map of the surrounding country, which will doubtless be of value to motorists visiting Ireland. It is published at 1s., and is issued in a very convenient form.

IRISH hotelkeepers are apparently expecting to reap a rich harvest from the great race, and are evidently convinced that automobilists are overburdened with wealth. Prices of accommodation have risen fast, and the "Daily Telegraph" points out, unless the hotelkeepers and others concerned exercise a little caution they may overreach themselves. For, greatly as all motorists and many other persons will desire to witness the contest, they will not be inclined to pay exorbitantly for the privilege; while those who visit the Emerald Isle will be in no

early as possible. The Lancashire and Yorkshire, Great Northern, Midland, and Great Central Railway Companies book passengers to Dublin by the City of Dublin Company's steamers via Liverpool. On the boats used in connection with the company's mail service between Holyhead and Kingstown no cargo is carried, and they will therefore be unable to take any motor-cars.

THE last American mail brings the news that Mr. C. J. Wridgway will accompany Mr. L. P. Mooers to Ireland as alternative driver of the Peerless car, which forms one of the American team for the Gordon Bennett race. Mr. Wridgway, who is well known in this country, will leave New York with Mr. Mooers on the 10th inst.

MESSRS. ALEXANDER WINTON AND PERCY OWEN, who will drive Winton cars in the Cup race, sailed from New York in the "Campania" on Saturday last.

MEMBERS of the Royal Irish Constabulary are learning how to ride motor-cycles, and it is reported that they will use these machines when accompanying the Lord Lieutenant on his motor-car rides through Ireland. Probably, too, they may find plenty of activity during the Irish Fortnight.

AFTER the great race and the festivities at Dublin a few days in the north will be followed by a return to the capital and the beginning of a great exodus to the South on the morning of Thursday, July 9th. From Dublin to Cork the distance is 156 miles, and the official suggestion is that whilst some may go direct to that town others will proceed *via* Waterford (97 miles), sleeping there on the Thursday night and arriving at Cork (76 miles from Waterford) on the Friday in time for the afternoon

Photo by] Lismore Castle. [Keohan, Dungarvan.

Photo by] Cahir Castle. [Holborn Clonmel

arrangements. Others will spend the night at Lismore. The latter place was a famous town in the twelfth century, and its castle dates from those early days. In his "Beauty Spots in the South-East of Ireland" Mr. C. P. Redmond, to whose delightful pages we are indebted for the accompanying illustrations, says the first bicycle seen in Ireland was made and ridden by a Lismore whitesmith in 1886. From Dungarvan there is a good flat road to Lismore, and over the town and valley the castle looms large on the landscape.

THOSE who journey from Dublin to Cork will go *via* Maryborough, Cashel, with its lonely rock and ruins, and then, forty-nine miles from their destination, will arrive at Cahir. The roads in the district are better than the average of Irish roads. Beyond Cahir the road rises somewhat and will be found decidedly uneven in many places. The district is a beautiful one

and well cultivated, the castle on the river Suir being a striking feature of the local scenery. The district is of importance to salmon fishers.

THOSE who stay at Waterford will probably take a run out to The Sweep, making a detour to see one of the most picturesque passes in the South of Ireland. Then by way of Fenor a view of the fine ruin of Don Isle, or Dunhill, is obtained. The castle is raised about a lofty rock, standing isolated from the roadway and seemingly invulnerable from attacks of mediæval marauders, who were as plentiful as blackthorns in these parts.

A WORD as to Waterford itself. This is a town of historic interest, commercial importance, and pleasant surroundings. As

Photo by] Dunhill Castle. [Goodman, Waterford.

Photo by] Reginald's Tower and Quay, Waterford. [Pools, Waterford.

the scene of Earl Roberts' boyhood it will be of interest to many, while the antiquarian will revel in its streets and along the quay. Here Reginald's Tower is preserved as a reminder of Reginald MacIvor, whose exploits in the eleventh century were no able in their way. Successively it has been a fortress, a prison, a mint, an armoury, and a police station. Now it seems to have retired from active service and has advanced to the position of an object of interest.

WHETHER the direct route to Cork is taken or a detour is made via Waterford, the beauty spots of the South-east of Ireland will bring new pleasures to many motorists from the Sister Isle and from distant lands, who will find in the excellent Guide of Mr. C. P. Redmond, of Waterford, the proverbial "philosopher and friend"—a literary companion well recommended.

SOME USEFUL NOTES.

NOVICES and careless motorists frequently apply wrenches and spanners with so much power to an adjusting screw that the part into which the screw goes is cracked, as shown in the accompanying sketch. Dirt and gummed matter may work into the crack and fill it, so that the defect will not be observed. The chances are that the mechanical action due to the vibration of the vehicle is making the weak place dangerous by expanding the crack, which may ultimately break through to the shaft. If, on inspection, defects of this sort are found, new parts should at once be substituted.

IF motorists will make it a rule, when starting out on a trip or ride, to "know" and not only to "think" that their petrol tanks are full, many a long walk will be prevented.

GREAT care should be taken of the spare inner tubes it is advisable to carry when out on a long run, and they should be so stowed in the car as not to be damaged in any way. It is really astonishing the careless way many motorists carry their spare tubes. They are often stowed in the tool boxes or lockers without sufficient, and usually, in fact, without any protective

night. When plenty of water and a hose are available, all that is necessary is to play water on the car, as is usual with a carriage, sponge down to dry and afterwards polish with chamois leather. On no account should the car be rubbed with a dry cloth, as little particles of grit and dust will quickly spoil and scratch the paint.

FULLERS' earth or lime make a very good brake dressing, as it dries up any oil and gives a good grip. It is not advisable to use resin, as this makes the brake too fierce at first and quickly wears off, leaving a hard polished surface which does not grip so well as the Fullers' earth dressing.

WHEN driving over greasy or slippery roads, use the brakes as little as possible. If they are applied suddenly the car is likely to skid and turn round. The best thing to do when skidding commences is to disengage the clutch, slow down the engine, and manipulate the steering-wheel until the car is going straight, then accelerate engine, and let the clutch in very gently.

BOTH the inlet and exhaust valves require grinding in occasionally. Of course, the frequency of the operation depends on the amount of care that has been taken in running the car. If too much lubricating oil and a mixture of too great strength has been used, the valves and seatings will deteriorate very rapidly,

The Paris-Madrid Race.—The 24-h.p. Pipe Racer.—The Car was driven by M. Van de Poel, which reached Bordeaux in 28 h. 124 min. 6 sec., being 27th in the Heavy Car Section.

covering whatever, and there exposed to influences most destructive to rubber. Subjected to friction from tools and other articles when the vehicle is in motion the rubber rapidly deteriorates, this deterioration being assisted and hastened by the presence and contact of oil or greasy articles. The tubes should be kept in a suitable box or a strong rubber cloth bag, the interior of which is well treated with powdered talc, the latter acting as a lubricant, any slight friction which may take place between the inside of the box or bag and the tube has no bad effect. Thus protected, an air tube may be kept folded up for a long period without losing anything of its durability or elasticity.

THE novice motorist will be well advised to "hurry slowly": in other words, he should not be too anxious to get on to his top gear. He should become well accustomed to the first speed before attempting to put in the second, and become familiar with that before attempting to drive on the top gear. There is more in this than is perhaps apparent, but it must be obvious that much finer steering is required when travelling at say twenty miles per hour than at five, and one can only learn to properly and confidently steer a car running swiftly by thoroughly learning first of all how to handle the car when travelling slowly.

To maintain the appearance of a car it is necessary to clean it every time it has been used before putting it away for the

pits and depressions forming in them. To grind in the exhaust valve run a little olive oil round the face of the valve and seating, and put on a little emery flour. Before putting on the emery, the cylinder port should be carefully plugged with some rag so that no emery can get into the cylinder and score its walls. Work the valve to and fro on its seat with a screw-driver, raising it occasionally and letting it drop back on to its seat. When all the depressions and irregularities have disappeared, the emery and oil should be carefully wiped and washed away, and the valve ground for a few minutes with oil only. To grind in the induction valve, the operation is the same except that this valve can be worked in the hands or placed in a vice.

AT a meeting of domestic servants in Hyde Park on Sunday the chairman said he, as a coachman, objected to having to clean motor-cars.

OUT of fifty-one starters in the tourist section of the Paris-Madrid race, forty-seven reached the Spanish capital within the specified time.

PHENIX MOTORS, LIMITED, is the title of a company registered with a capital of £10,000 to manufacture and generally deal in and with automobiles, and to adopt an agreement with Messrs. J. Van Hooydonk and A. F. Ilsley. The first directors are Messrs. J. Fraser, R. Ibbotson, J. Van Hooydonk, and A. F. Ilsley.

HERE AND THERE.

ANOTHER motor-omnibus is now on trial at Eastbourne.

SR. JULIO A. ROCA, President of the Argentine Republic, has, we learn, acquired an Oldsmobile.

MOTOR CYCLES have just made their first appearance at the Bath and West of England Agricultural Show.

THE Doherty Motor Accessories Company, Coventry, have opened a department for the manufacture of bucket, phaeton, and other seats.

MOTOR-VEHICLES are now admitted to the carriage enclosure on the Goodwood racecourse on the same terms as ordinary carriages.

AMONG the victims of police watchfulness in a recent list of alleged furious driving cases was Mr. J. Drysdale Sanders, the High Sheriff of Lincolnshire.

A SOMERSET county magistrate has been fined 10s. and costs at Bristol for causing an obstruction with his brougham in Cattle Market Road, at Bristol.

A USEFUL guide to the Metropolitan Railway Extension in Middlesex, Hertfordshire and Buckinghamshire has been issued by Mr. A. C. Ellis, the general manager.

FROM the A. L. Dyke Automobile Supply Company, of St. Louis, U.S.A., comes a 200 page catalogue of motors and motor accessories, in which everything required for petrol and steam cars will be found.

MESSRS. WEBSTER AND BENNETT, engineers, Coventry, report that the demand for machine tools for the British motor industry is developing, although the major part of their output still goes to France and Belgium.

THE Durkopp Motoren Gesellschaft, Limited, has been registered with a capital of £100, to carry on the business of manufacturers, vendors, and factors of, and agents for, motor-carriages, etc. Mr. R. Asch is the first director, and the registered office is at 3, The Exchange, Muswell Hill, N.

At the Waterford Petty Sessions Mr. C. P. Redmond was the complainant in a civil summons to recover from the Waterford Bridge Commissioners £5 for having exacted from him 4d. for a bicycle, the charge not being authorised by law. After a lengthy hearing the case was dismissed. An appeal will probably be taken against the decision.

SOME trials took place a few days ago in the neighbourhood of Andover, in the presence of a number of officers from the War Office, with the object of testing the "Little Giant" steam motor of Messrs. W. Tasker and Sons, for Army transport purposes. The task set the "Little Giant" was to haul a load of 5 tons a distance of 20 miles, which, we understand, it performed in a most satisfactory manner.

THE Governor of New York State has signed the Bailey Automobile Bill, which contains regulations in regard to motor-cars which put them on a level with ordinary street vehicles with regard to speed. They must reduce their speed to eight miles an hour when passing a pedestrian or a horse-drawn vehicle, which means that this speed will be the limit, as, naturally, pedestrians or vehicles must be constantly met.

At the last meeting of the Liverpool Chamber of Commerce a letter was received from the London Chamber asking whether the Chamber would be willing to ask the Association of Chambers of Commerce not to move further at present in the matter of the resolution recommending the raising of the tare limit of motor-vehicles, which was carried at the recent spring meeting of the association. The Liverpool committee, however, considered that the question of increasing the tare limit for motors should be kept separate from other questions, and a letter to that effect was sent to the London Chamber and the Association of Chambers.

A MOTOR-CAR is to be ordered for the use of the officers of the Wiltshire County Council.

R.A.C.E. is the short title by which the recently-formed Royal Automobile Club of Spain is known.

MORE than £700 worth of cars were sold at the May auction sale of the Speedwell Motor Co., at Reading.

ACCORDING to the Board of Trade Labour Department, employment is good in the motor-car industries of the Midlands.

THE Lanchester Engine Co., Ltd., had an exhibit at the Bath and West and Southern Counties Agricultural Society's Show at Bristol.

A MEMORIAL has been prepared setting forth the claims of the West Limerick district for a motor-car service under the new transit scheme.

WE hear that the Gas Lighting Improvement Co., of 18, Devonshire Street, Bishopsgate, E.C., have introduced a new petroleum spirit.

MESSRS. J. PHILLIP AND SONS, 37, Wilton Place, S.W., have accommodation for the storage of cars, either temporarily or by the week or month, etc.

The Tourist Section of Paris-Madrid. Madame Lockert on the 12-h.p. Ador Car in the Auvergne Mountains.

THE exports of automobiles and parts from the United States during the month of March were valued at £18,722, compared with £17,670 in the same month last year.

A RESOLUTION has been adopted by the Holderness Agricultural Club in favour of the retention of the speed limit and the imprisonment of motorists charged a second time with furious driving.

SPECIAL articles on the Gordon Bennett race have appeared in most of the Irish newspapers, one of the most notable having been published in the Cork Exhibition issue of the Dublin "Weekly Independent."

CAPTAIN WOODS, D.S.O., has acquired a 15-h.p. Panhard car from the British Automobile Commercial Syndicate, Limited. The body has been fitted by J. Rothschild et Fils, Limited, of London and Paris, and is of the Roi d'Espagne double phaeton type.

THE new 400 gallon motor steam fire engine built for the Portsmouth Town Council by Messrs. Merryweather and Sons has been tested before the Mayor and Council. The engine turned out from the fire station in 55 seconds from the alarm travelled at a high speed along the road, and gave a display with one, two, and four jets.

THE Chief Constable of Hull has given the local police instructions to keep a watchful eye on motorists.

THE Right Honourable Sir J. H. Macdonald (Lord Kingsburgh) has been appointed Honorary Colonel of the Motor Volunteer Corps.

At a bazaar held at Theydon Bois, Epping Forest, the patrons were taken for short rides into the Forest on the Premier's motor-car at 1s. per head.

CANTERBURY, Brighton, Worthing, Eastbourne, Folkestone, and Basingstoke are towns to be visited by the competitors in the Auto-Cycle Club's Reliability Trials in August.

MESSRS. ALFRED DUNHILL, LIMITED, have just introduced the specially designed straw cap for summer motoring illustrated herewith. So far as it has yet been supplied it has met with

unqualified approval. In addition to the cap illustrated Messrs. Dunhill can supply one with a patent peak. They have also similar caps, both in white and burnt straw, plain and pleated, for ladies.

MR. KER-SEYMER and Lieut. Trippel have been doing duty for the Motor Volunteer Corps for the General Officer commanding the Home District. The Inspector-General of Fortifications has also employed the services of a member of the Corps for his inspection of Hounslow and Windsor.

THE members of the Halifax Automobile Club, following their very successful excursion to Southport at Easter, promoted a trip to Scarborough for Whitsuntide. A start was made on Whit Sunday morning from the Plummet Line Hotel, Halifax, the Post Office Square at Leeds being the first stop. Then the journey was continued to York, where lunch was served, the subsequent route being via Malton. At Scarborough the party stayed at the Grand Hotel.

THE 10-h.p. Argyll car which was driven from Glasgow to London in the Scottish Automobile Club's Competition was fitted with a thermo-syphon cooling bonnet. When the car reached London, the driver, Mr. Whitehead, found that the bonnet would not take another pint of water. The efficiency of the thermo-syphon depends on slow circulation. That is to say, the greater number of tubes put into the bonnet the slower the circulation becomes, and hence more efficient. As soon as there is a difference in the temperature the circulation starts, and the whole design is based on the assumption that a difference of temperature will always be maintained between the top and the bottom of the bonnet. This is controlled by the size of the waterways top and bottom.

A MOTOR fire engine has been purchased for the new Haringay fire station of the Tattenham District Council.

THE Basingstoke Town Council is erecting a number of caution boards for the benefit of motorists passing through the town.

A HERTFORD motor-cyclist has been fined £5 for not stopping when requested to do so by the driver of a horse-drawn carriage.

MR. A. E. MAJOR, of Reading, has been appointed agent for Darracq cars in Berkshire, Buckinghamshire, Hampshire, and Oxfordshire.

SOME members of the Cardiff Health Committee have been making an inspection of motor-vans for the town scavenging department.

A PUBLIC motor-car service is about to be started between Como and Chiasso, Italy. The vehicles selected are 24-h.p. De-Dietrichs.

THE South Tipperary County Council has resolved to co-operate with Lord Iveagh and Mr. Pirrie in establishing motor-car transit routes in the county.

NEW regulations in Denmark fix the maximum speed of automobiles at nineteen miles per hour on open country roads, and nine miles in towns and villages.

MR. W. THOMPSON has established a well-equipped garage at the Central Cycle Works, Castle Northwich. He has every facility for repair work, and keeps a stock of petrol, etc.

At the annual conference of the Rural District Councils Association, held at Bristol, a resolution was carried urging that the present speed limit of motor-carriages should not be unduly increased.

MESSRS. ANDREW MELVILLE AND SONS have opened a repair depot with inspection pit at 114 and 116, High Street, Dunbar. They are also keeping a large stock of petrol, spare parts, oils and greases, etc.

HENLEY-ON-THAMES Corporation have unanimously resolved to send a petition to the Prime Minister, urging that the speed of motor-cars when passing through any town shall be limited to not more than eight miles an hour.

THE King took a trip on his new petrol motor launch on Monday afternoon on the Thames, and had a cordial welcome from the thousands who were on the river. The launch is 33ft long, and has accommodation for ten persons.

THE Mulliner Motor Body Company, of Church, Accrington, have sent us a photograph of a new double artillery wheel they are introducing. It is in the form of two light artillery wheels, as regards the hub, the spokes converging on one felloe; it is designed to resist the strain of a side slip or twist going round corners, for, instead of the spokes taking this strain like an ordinary artillery wheel, at right angles, it is taken by a direct downthrust of the spokes. The Mulliner Company inform us that they can make the new wheel as light, if not lighter, than an ordinary one, and they claim that it is three times as strong; it is easily adapted to any axle, and the cost is not great.

THE "Figures, Facts, and Formulæ of Photography" is a practical little work issued by Messrs. Dawbarn and Ward, Ltd., and edited by Mr. H. Snowden Ward. So many motorists are amateur photographers that reference to this practical guide will be widely welcomed by our readers. Within 200 pages we have here much concise information with regard to the lens, exposure, developing, and printing; while the instructions as to lantern slides will be useful to those who are asked to give lectures to various societies on the automobile, and who are anxious to make them doubly interesting by the introduction of pictures. Directions are given to facilitate the use of any kinds of plates or films, and we commend the volume as one of the best of its kind.

CORRESPONDENCE.

A CAR FOR DOCTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to Mr. Villiers Lucas and W. W. L.'s letters in last week's issue of the *Journal*, I venture to refer them to the Albion Motor Car Company, Limited, for the car that meets with their wishes. It is the most suitable I know of for a doctor. (1) It is not absolutely silent—no petrol motor is—but it is as silent as any now on the market. (2) Seating for two or four. (3) Chain and live axle drive. Is easy to drive and manage, and is geared to 14 or more miles per hour. It is strongly built and made to last for a dozen years, anyway, taking 4,000 miles a year out of it. The tyres are solid rubber and cost 3d. per mile, petrol-fuel 3d. per mile. Repairs per year for 4,000 miles, £15.

The engine is fitted underneath the seat, though the firm make cars with the vertical motor in front. It can be started from the seat by a rope starter.

I know many doctors who are using this type of car in their work, and they all speak highly of them. There are no batteries or accumulators. The ignition is magneto, with generator for making current. It is simple and not liable to get out of order.—Yours truly,

"AULD HAND."

MOTOR-CAR RACING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Do you not think the time has now come when an International Committee should meet and settle rules that would make racing of much greater interest than it is at present, make it open to many more than it is nowadays, and at the same time improve the efficiency of motor-cars in every direction? Broadly speaking, my suggestion is that the gross cubic capacity of the cylinders should be settled with a maximum limit, and that the weight of the cars should not be less than a certain amount. The effect of this would be that everybody would build their cars up to the biggest cylinder capacity, and by various arrangements of stroke and bore a highly-efficient engine would probably be evolved.

By setting out that a car should not weigh less than a certain amount the weights could not be cut down to a dangerous extent, and then the only way one could improve a car would be by friction-reducing devices, more efficient gears, more efficient tyres, and improvements in a hundred and one small points which all go to make up a perfect motor-carriage. If everyone was mounted on a vehicle which did a maximum speed of thirty-five or forty miles an hour, it would be just as interesting, in fact racing would be more interesting, as the personal element would come in to a large extent, and also the condition in which the car was kept.

I think if the whole matter was thoroughly well ventilated by an International Committee, and that if this took place immediately before or after the Gordon Bennett Race, when representatives of all countries would be present, a highly-satisfactory result could be achieved and an interesting sport preserved. It is, of course, necessary to settle this very quickly, so that the models that would be suitable to come under new racing rules can be put in hand at once.—Yours truly,

S. F. EDGE.

QUERIES RE PEUGEOT CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I read in your issue of the 16th ult. that Mr. A. Winter is troubled with knocking in the engine of his 8-h.p. Peugeot car when thrown into top speed gear. Perhaps the following explanation may prove interesting and useful to him. The knocking is probably caused by Mr. Winter having his ignition too far advanced when changing from second to top speed. What happens is this: he is probably running on second with ignition fully advanced; in changing to top gear the change is not made quickly enough, consequently the car loses a certain amount of impetus, and when the top is in the engine cannot pick up sufficiently quickly to correspond with the position of the ignition, hence the knocking or pounding. To avoid such a thing, which is very bad for the engine, Mr. Winter should retard his ignition a little directly the top gear is in, and then as the engine picks up gradually advance his ignition again. As an owner of an 8-h.p. Peugeot, I have found that the engine does not run anything like her best when using the heavier petrol; it is quite possible this might be Mr. Winter's trouble. I have never driven a more reliable or nicer car than this Peugeot.—Yours truly,

M. F. MIEVILLE.

HIGH-SPEED TREMBLER COILS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Dr. McClymont's letter, I may say that I have a 34-h.p. De Dion voiturette, fitted with a wipe contact and a trembler coil with a Charpentier trembler, which I obtained from Van Raden, of Coventry. I consider that the engine power is increased, and do not think that the engine is "slowed" in the slightest. The engine generally starts at the first turn, and misfires (except those from a wrong mixture) are practically unknown.—Yours faithfully,

R. SUTTON CLIFFORD, JUNR.

THE SPEED LIMIT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a sequel to the Paris-Madrid scandal, we have now a revival of the agitation against the abolition of the speed limit. This is one of the many annoyances for which the ordinary motorist has to thank that pest of the roads—the high-powered car. Here is a sample of the stuff now influencing public opinion for the worse. I quote from a leader of an important provincial paper, the "Western Daily Mercury":—"The sad events in France will inevitably exercise a great influence over the Bill which Mr. Walter Long is to introduce into Parliament," and it declares forthwith against the projected removal of the speed limit. "The French motor race has shown us the danger in time." This semi-hysterical style of writing (now to be seen in all quarters) must do our cause great mischief. What a fine opportunity for the reactionary party! And why does this party get the chance of doing mischief? Why are we to incur increased risks of being numbered, placarded and policed? Simply because a handful of big car owners want to break records on roads which are not suitable for the speeds attained.

It appears to me that it is high time for the ordinary car owner and motor-cyclist to enter their protests against automobile racing of any sort being held on public roads. The upshot is a general growth of the belief that automobiles are all piloted by Jehus. Commercially speaking, the racing automobile may be a good advertisement for some particular firm which caters for big car owners. But, after all, the big high-powered car is very unwelcome on most roads, and, as usually driven, a general menace. What the public wants is tests (e.g. "non-stop touring" trials) which go to improve the ordinary automobile as used for business or pleasure. It may not be feasible to limit the horse-power of the automobiles allowed on highways, but one is apt to regret that the racing car ever appears there, its place being a private track or motor-way. We motorists of the ordinary and far more important class know very well how much of the hatred of us is due to the abuses of big car driving on the high road. And we know also that this racing craze only serves to make our position in the eyes of the public worse.—Yours truly,

E. DOUGLAS FAWCETT.

INFORMATION WANTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If Mr. Lucas, who asks for advice about a car, succeeds in getting one to suit him, it will be interesting to hear after, say, a year's use of it, his candid opinion on his own letter. I venture to say that he will be heartily ashamed of it.

It is curious how speed, the fascination of which is yielded to by the driver of every type of vehicle, from the coster in his donkey-barrow to the millionaire in his Mercedes, is always denounced, generally in somewhat discourteous language, by those who have obviously had no experience of its exhilarating effects, and who generally imply that vehicles are never used except for the purpose of "admiring the country"—blessed phrase!

Does Mr. Lucas never have to drive hurriedly to catch a train, or to keep an appointment; and does he always take a slow train to town in order the better to admire the country? The fact is that by far the greater number of vehicles—cars included—on the road are there, not for the purpose of admiring the country, but of getting from one place to another, and the quicker they can do this the better for everyone.

I quite admit that, if there is a time for speed, there is also a time for going slowly, and I wish to point out that the pleasure of a slow and quiet drive, in which many, myself included, wish to indulge on occasion, is quite spoilt by the noisiness of the petrol car at low speeds—a noisiness which not only often induces a driver to use, for the sake of quietness and smoothness of motion, a higher speed than he would otherwise employ, but undoubtedly creates a prejudice in the minds of the rest of the public against these vehicles.

On this point "steamers" have a great advantage, and I cannot but think that makers would find it worth while to try and remedy this defect. For instance, wheels with skew teeth (of course, with proper ball thrusts) might be used in the change speed and valve gear; or a spring drive, by keeping the teeth steadily in contact, would probably be an advantage.

I should like, while writing, to draw attention to what seems to me want of tact on the part of the advocates of automobilism. They talk much of the "sport" and "the industry"; which enables their opponents to reply that the sport is a rich man's monopoly, and is a nuisance that should be suppressed, and that the country would not be much the worse for the stoppage of a new industry which provides the nuisance. It would be far better to lay less stress upon the sport, and more upon the large and increasing number of moderate-sized cars that are used by their owners precisely as they would use an ordinary horse drawn vehicle. And it might be well to try to convince the public that a ten-horse car is practically only equivalent for all-round work to a carriage and pair.—Yours truly,

FABER.

MESSRS. JOHN CHILD MEREDITH, LIMITED, write:—"Now that so many motorists are interested in the wipe contact, particularly in converting their De Dion motors, we think it as well that it should be mentioned that it is necessary to have a vibrating coil if a wipe contact is used. We more particularly mention this as during the last few weeks we have been having a great deal of unnecessary correspondence, owing to the fact that many motorists do not understand this point, being under the impression that if they fit the wipe contact they can still use their present non-trembler coil."

THE GLASGOW TO LONDON NON-STOP TRIAL.

THE Committee of the Scottish Automobile Club (Western Section), having carefully considered the observers' reports on the various vehicles entered for the Glasgow to London Non-Stop Trial, 13th and 14th May, have approved and adopted the following tabulated report. Certificates will be issued in respect of the vehicles which completed the entire distance, with exception of No. 25, in accordance with the results shown, in due course. The total possible marks in each case is 1,000.

† Nominal.

NOTE.—It is believed that no motor-cycle came through without pedalling, but no marks are deducted in that respect.

A DRIVER SENT TO PRISON.

At the Clerkenwell Sessions, before Mr. W. R. McConnell, K.C., Alban Gentilli, 18, mechanic, of French nationality, surrendered to his bail on a charge of having, whilst in charge of a motor-car, caused bodily harm to William Smith, a valet, by furious driving and wilful misconduct. On the morning of March 17th the prosecutor and a friend were riding on bicycles in Hyde Park. They proceeded at a moderate pace from Stanhope Gate to Apsley Gate, at Hyde Park Corner. As Smith, who was leading, was about to leave, the accused was alleged to have suddenly swerved his motor-car on to the off-side. It was said that he sounded no horn or alarm, and, running at a great speed into Smith's bicycle, caused the prosecutor to be shot up into the air. He turned one or more somersaults, and alighted on his head on the granite crossing. Gentilli continued to drive on, in spite of shouts of spectators, but constable 579A, recognising him as working at "Automobilia (Limited)," in Oxford Street, W., went there and arrested him. Smith, in an unconscious condition, was conveyed to the St. George's Hospital, where he was found to be suffering from a scalp wound, concussion of the brain, and shock. He was bruised about the body, shoulder, and limbs, and was detained in the hospital for nearly a month, and now remembered nothing of the affair. The jury, in convicting Gentilli, commented on the youth of the accused, and censured "Automobilia (Limited)" for allowing him to have charge of heavy, powerful cars in London streets. A previous

riding recklessly, and that he nearly ran Worthington down. A number of witnesses were called, and the case was eventually dismissed.

ALLEGED REFUSAL TO STOP.

At the Albrighton Petty Sessions, at Shrewsbury, Percy Martin, manager of the Daimler Car Works, Coventry, was summoned for refusing to stop a motor-car when requested to do so. He was represented by Mr. J. C. H. Bowdler. Mr. T. S. Minton, farmer, Montford, hon. secretary to the Shropshire Association for Protection Against Dangerous and Reckless Motor-car Driving, stated that while driving in a pony trap towards Shrewsbury, on the 9th inst., he saw a motor-car coming along towards him at a speed of about twenty miles an hour. When a distance of about fifty yards divided them he called out to the defendant to stop, and held up his hand, in consequence of his pony growing restless at the sight of the car. Defendant, however, took no notice whatever of these warnings, and came right up to the trap without slackening his speed. The defendant denied that Mr. Minton held up his hand at all, at any rate in such a way that he could see it. Mr. Minton, as a matter of fact, was on his wrong side of the road, and the vehicle came in contact with the car, which was actually at a standstill at the time, through the pony swerving across the road. The

The Paris-Madrid Race.—The 20-h.p. Decauville which finished third in the Light Car Class, doing the journey to Bordeaux in 6h. 19m. 8sec.

offence for furious driving a motor-car having been proved, Gentilli was sentenced to three months' imprisonment in the second division.

CLAIM FOR WORK DONE.

At the Ilford County Court, Ernest Jacques sued The S.X. Cycle and Motor Company, of Ilford, for £2 paid under protest to the defendants for re-leathering the clutch of a motor-car, also for £4 damage caused by the alleged negligence and unskilful work of the defendants to the car; and for the return of goods alleged to be unlawfully detained, or £1 14s. their value. His Honour gave judgment for the plaintiff for £5, to be reduced to £4 if the battery is returned within ten days, with costs.

DOG V. MOTORIST.

At the Derby County Court, Joseph Butler claimed £7 from Samuel Worthington for damages sustained to himself and his motor-cycle by reason of defendant's dog not being under proper control. It was alleged that the defendant's dog, a St. Bernard, weighing 10 stone, was romping and racing about Victoria Street on the night of 25th March, and ran into the plaintiff, who was on his motor-tricycle, knocking him off and damaging his machine. For the defence it was contended that the plaintiff was

Bench, concluding that a signal was given by Mr. Minton to stop and that defendant disregarded it, imposed a fine of £5 and the costs.

POLICE TRAPS.

BERKSHIRE police traps include one at Old Windsor, and another about a quarter of a mile from the police-station at Clewer, in addition to those already reported.

We understand there is a police trap on the London side of Dorking by which motor cars are stopped in the town (even though going slowly through) if they have been seen travelling fast outside. This is said to be effected by means of signals from Box Hill.

THE Avenue, Southampton, is now regarded by the police as an enticing trap for motor-car drivers, a mile having been measured off for the purpose. At Totton there is a measured distance about 500 yards from the bridge between Southampton and Totton.

SOME person, probably a member of the Yorkshire Automobile Club, who has evidently been caught at the Spacey Houses Police Trap, has been good enough to paint a warning sign on the wall in bold letters, about 12 in. high, "Motor Trap," and if any other motorist is caught there it will most probably be his own fault.

THE following police traps and measured distances are most elaborately arranged near Malton and York. One at Four Alls Public House, six

miles from York; also between the seventh, eighth, and ninth milestones, at Barton Hill, and 1½ miles from Malton, past Old Malton Cross Lane, 400 yards after the school with clock tower. There are notices posted in and about Malton, printed in bold red letters, and stating that the full penalties will be inflicted.

MOTORIST SENT FOR TRIAL.

At Marlborough Street (London) Police Court, Emile Soland, a French engineer, of Bloomsbury Square, was charged, on remand, with furiously driving a motor-car in Regent Street on Sunday, May 3rd, thereby causing bodily harm to Hugh Evans.

Constable Hollands deposed that at about 12.30 on the morning in question the defendant came along Regent Street at about eighteen miles an hour. At Foubert's Place the car shot between the kerb and a cab. A shout was heard, and witness found Mr. Evans lying injured in front of the car, which had stopped. Mr. Denman said that in cases where persons were mangled he always committed for trial, and expressed his opinion that until there had been two or three convictions for manslaughter the public would continue in an unsafe state. Soland, who pleaded not guilty, and reserved his defence, was committed for trial, bail being allowed.

Lincoln ...	A. Leigh	—	15s.

Where no alleged speed is given it is understood to be above the legal limit.

* Motor-Cycle Cases.

Pressure on our space prevents the publication of all the cases heard during the week.

As a result of a trap at Carshalton Hill, a batch of motorists appeared at Croydon Police-court on Saturday last. In the case against Andrew Anderson, police-constable Ewers said that on May 9th he was on duty at Carshalton Road, where he saw the defendant coming along in a motor-car, and he covered a measured 220 yards in 27 seconds. This worked out at 17 miles an hour. The defendant vigorously disputed the evidence. The car, he said, was only purchased the day before he was stopped by the police, and it was his first run out. He had since tried it twenty times under similar conditions and found it impossible to travel at the speed named. The magistrates were impressed by Mr. Anderson's defence, and in the hope that he would be careful in future they let him off on paying 5s. 6d. costs. Another defendant, Harold S. Hilsley, denied going at the rate as alleged. His tyre, he said, was punctured, his brake was on, and his friends in the car warned him of the trap when they saw the first police-

man give the signal. He (the defendant) then simply crawled down the hill. A fine of £2 8s. 6d. was imposed in this case.

At High Wycombe on Saturday John Reynolds and William Banks, drivers for Major Cecil Grenfell and Lieut. Arthur Grenfell respectively, were summoned for driving at excessive speed. Evidence showed that in 30 secs. defendants travelled 300 policeman's paces, which worked out at 20 miles an hour. Defendants admitted the offences, saying they had driven their masters' guests from Beaconsfield to the Yeomanry camp at Wycombe.

At Lancaster, on Saturday, Mr. Scarisbrick, the Mayor of Southport, was summoned for furious driving. The defending solicitor obtained an adjournment, as defendant had a similar charge to meet at Garstang.

In the case of G. W. Holliday, who was summoned by police-constable Harris (71A) for furiously driving a motor-car in New Street and Corporation Street, Birmingham, the defendant denied he was the man, and said that on the date in question his car was being repaired at the works. Evidence to this effect having been given, the case was dismissed.

At Wokingham (Berkshire), on Tuesday, George Dupare, driver to Captain A. Fletcher, of the 2nd Life Guards, was fined £25 and costs for two offences on the same day, and for refusing to stop when called upon by the police.

MR. T. TAYLOR has opened a repair shop and garage at Forest Row, Sussex, where a stock of petrol and accessories will be kept on hand.

MESSRS. CHIPPENDALE AND CO. inform us that they have taken the Grand Hotel Garage, Harrogate, with accommodation for fifty cars.

TO-DAY (Saturday) the members of the Scottish Automobile Club are to pay a visit to Philiphaugh, Selkirk, on the invitation of Mr. W. Strang Steel.

WE understand that Mr. E. Shrapnell Smith has resigned his position as general manager and secretary of the Road Carrying Co., Limited, of Liverpool.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C.4, and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, JUNE 13, 1903.

[No. 223.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

UNHAPPY is the member of the canine tribe who wantonly rushes beneath the wheels of an automobile. Such a course of misconduct invariably leads to fatality, and is usually followed by letters to the Press denouncing as murderous villains the occupants of the motor-car that is nearly upset by the canine onslaught. Owners of animals must really keep them under control; that they have been allowed to wander aimlessly across the carriage way and to suddenly threaten passing cyclists is an old custom that needs revision, in view of the new locomotion, and we would impress upon lovers of dogs the necessity of training them to regard motor-cars with the indifference that all well-disposed animals show to other vehicles. Otherwise the consequences to the dogs will be as serious as Stevenson thought they might be to the "coo" that wandered on to the railway track.

Motor-cars at an Agricultural Show.

THE forty-sixth annual show of the Ormskirk and Southport Agricultural Society had a novel feature in a contest between about a dozen motor-cars. It was stated at luncheon by the Mayor of Southport (Mr. T. T. Scarisbrick), who is president of the Society, that so far as agriculture is concerned the motor-car has come to stay. In the motor-car they had a representation of the spirit and the progress of the age. The farmers present, so far as could be gathered, however, had not quite the opinion on this subject that Mr. Scarisbrick had. They raise horses for agricultural work, and are not yet prepared for scientific adjustments such as bring the motor-car to apply to their industry. If the farmers had their doubts the general public gave no consideration to them. They were delighted by a novel competition. Each car had to run round the track, had certain evolutions to make, and all was done swiftly and skilfully. The first prize went to Mr. Leonard Williamson with his 10-h.p. Lanchester, the second to Mr. Harold Bell, and the third to Mr. W. Dudley Coddington with his Georges Richard car. The first motor-car display at an agricultural show took place at the Highland Society's exhibition at Perth in 1896, when there was one entry and no competition.

Furious Driving.

OUR list of alleged cases of furious driving seems to have been increased in length by the fine weather, which has taken policemen as well as motorists on to the highways, there to lie in wait for unsuspecting wayfarers. Scotland and Ireland are represented in the list, while hardly an English district where good roads are found is absent. It is a curious revelation of the respect in which the law is held, and should convince legislators as to the widespread dissatisfaction with the existing state of things. At the same time, we would draw attention to the publication of police traps in our columns as constituting a useful feature for motorists on tour.

Police Traps.

AN enterprising Yorkshireman has improved upon our plan of helping our readers, and has posted bills on the telephone poles warning passers-by of the existence of a police trap. Pieces of paper on the roadside have long been familiar to motorists as warnings not to be lightly disregarded, but this scheme has had sufficient of the element of novelty to arrest the attention of the police, with the result that this public benefactor has had to appear before the magistrates, by whom he was promptly fined. Fortunately, the *Journal* cannot thus be hauled before a Yorkshire Bench for seeking to prevent the flow of fines into the county coffers, and we would take this opportunity of thanking those readers who have kept us informed of the presence of police traps in their localities.

The Automobile Mutual Protection Association, Limited.

A GENERAL committee meeting of this Association was held at the registered offices, 88, Chancery Lane, London, W.C., on Friday, the 5th inst., when there were present Mr. J. J. Mann (chairman), Messrs. E. Shrapnell Smith, E. Lisle, Charles Cordingley, A. E. Hodgson, R. Moffat Ford, and F. F. Wellington. Mr. G. R. Helmore, F.C.A., the secretary of the Association, was in attendance. A large amount of business was done, and numerous cases brought before the committee by members arising out of patent and other claims were dealt with. The Holland Park Motor Company, Messrs. G. T. Riches and Co., and Mr. Alfred Harmsworth were elected members of the Association. A satisfactory bank balance having been reported, the meeting concluded with a vote of thanks to the chairman.

The Stage and the Motor-Car.

APPARENTLY the automobile will soon prove an important method of vehicular progression for actors and actresses in their leisure hours and for the purposes of going to and from the playhouse every night. But as the "Era" points out, for real purposes of utility it must appeal more directly and seriously to the music hall performer, who at present has to keep or hire a carriage to enable him to do his nightly "turns." Among theatrical motorists are Mrs. Beerbohm Tree, Miss Eva Moore, Miss Ethel Mathews, Miss Kitty Loftus and Mrs. Arthur Bourchier. Messrs. Arthur Collins, T. E. Dunville, Lewis Waller, and Mr. George Edwardes are also motorists, and, according to Mr. W. P. Warren-Smith, Sir Charles Wyndham has for some time been thinking of going in for a car, but, owing to the car breaking down on a trial run, which made him late for rehearsal, we believe he has not yet decided to purchase. Mr. Frederick Stanley (Terry's Theatre) has lately joined the ranks, in ordering a car, and it is very probable that Mr. Herbert Sleath, of the Avenue, will follow. Then there are Chirgwin, Gus Elen, and George Foster, who are all seen to be riders and drivers for professional or private purposes. As far as memory serves, Mr. George Musgrove was the first manager to employ a motor-car for advertising purposes. It was during the run of the "Scarlet Feather," some four or five years ago, at

the Shaftesbury Theatre. Since then many managers have adopted this method of preventing their light and their programme from being hidden under a bushel." The practical side of motoring in the profession was forcibly illustrated the other day as a happy party drove up to the "Era" office. The motorists were four in number, and consisted of Mr. Harris Fineberg, of the "Star," Liverpool, Mr. and Mrs. E. Mill-Mitchelson, and Mr. J. G. Stafford. They had journeyed up from Liverpool, calling at Birmingham, Coventry, and Wolverhampton on the way to the metropolis, making an agreeable combination of business and pleasure.

The Scottish Automobile Club.

THE annual run of the Eastern and Western districts of the Scottish Automobile Club took place on Saturday to Philliphaugh, the residence of Mr. Strang Steel, a few miles from Selkirk. The weather was charming, but the roads were rather dusty. There was a large turnout of members and friends, and fully one hundred enjoyed Mr. Steel's hospitality. After lunch Mr. Norman D. Macdonald proposed Mr. Steel's health, to which the latter replied. Sir J. H. A. Macdonald (Lord Justice Clerk), in replying to the toast of his health, said that

steam emitted into the air behind. Whether the experiment was successful is not known. Pictures of Symington's car of 1786 and Hancock's steam car of 1833 were shown. Sir David severely criticised the conservatism of the country in not repealing the Light Locomotives Act before 1896. He estimated that 10,000 cars were made in France every year, half of which were exported, and although we were now improving, we were still copying the French patterns. The lecturer then discussed many technical points of importance to designers and purchasers of cars, and concluded with a cinematograph exhibition of the Paris to Berlin Motor-car Race. The view was taken at the Belgian frontier, and depicted the cars arriving, the examination of passports, and their subsequent departure.

Motor-car Drivers.

THE summary of the Census returns for England and Wales for 1901 has just been issued, and reveals the fact that in that year 623 men were classified as motor-car drivers, an occupation which had not appeared in any previous figures.

Probably since that date another two or three thousand could be added, and in future returns the automobile industry will prove a considerable factor in the totals. There is no doubt a

Mr. W. Strang Steel, of Philliphaugh, N.B., on his 12-h.p. Arrol-Johnston Car.

he came from Edinburgh in company with the Chief Constable, who had taken care that neither within nor without his jurisdiction had the speed limit been exceeded. After lunch the guests had plenty to occupy their interest in visiting Mr. Steel's Burmese Museum, which contains, among many curiosities, King Theebaw's state bed and the full-dress state armour of the commander-in-chief of his army. It was generally remarked that there was a great increase of large and high-powered cars among the members. Amongst those present were Messrs. John Macdonald (Chairman Eastern Section S.A.C.), George MacMillan (Secretary Eastern Section), Professor Dawson Turner, J. D. Crombie, Dr. Elder, W. L. Sleight, Councillor W. W. MacFarlane, John Adam, R. J. Smith (General Secretary S.A.C.), and Professor Galt.

Sir David Salomon's Views.

SIR DAVID SALOMON, Bart., delivered a lecture in the chemical lecture theatre, Oxford, recently, on the "Self-Propelled Vehicle." He commenced by giving Sir Isaac Newton the credit of conceiving the first idea of a self-propelled vehicle. This vehicle, which was constructed in 1786, was propelled by

large number of young men are going into the motor industry as drivers, and hardly a week passes without someone in another line of life writing for advice as to how to enter into the service. Unfortunately, we are afraid many mechanics have placed their calling in some disrepute by their forward and wayward manners. The coachman who has had experience only of carriages seems to give more general satisfaction to private owners, for the simple reason that he is accustomed to take an interest in the appearance of his vehicle. This may seem a small point, but it is one which should not be ignored by mechanics and others who wish to drive cars for private users.

In North and South.

THE "Yorkshire Post" in the north and the "Daily Telegraph" in the south have been admitting to their columns letters and news with regard to automobilism. In the last-named newspaper the views of motorists have been fairly stated by such authorities as Messrs. D. M. Weigel and S. F. Edge; in the former they have been misrepresented by editorial leader writers,

who seem to regard the whole thing as a joke. The new Bill produced by the Automobile Club with regard to the regulation of motor-cars on the highway is described in the Yorkshire daily as fit for the columns of a comic paper, and our contemporary seeks to ridicule the movement to place the present position in a more satisfactory light. The law is now disobeyed by J.P.s who motor as well as by motorists who are not J.P.s; judges have declared its absurdity; the Premier himself cannot keep within its restrictions; the author of the existing Act declares its inadequacy, and altogether the merit of the Bill is that it seeks to remove a state of things that would be laughable if not so serious. Why, then, should a great newspaper seek to travesty the position?

Picnicing in Savernake Forest. (See page 264 last issue).

Newspaper Sensation.

REALLY, it would appear that some of the editors of newspapers have instructed their correspondents to chronicle every mishap to a motorist and to give the most exaggerated picture of such incidents. The most insignificant occurrences in which motor-cars happen to figure are being glorified in the boldest type, and nothing is apparently being left undone to prejudice the public mind against what every reasoning person recognises as the inevitable. In fact, it would appear that some editors have reverted to the days of prejudice that followed the passing of the Act in 1896.

"In the Heart of the Country."

ON a petition being received by the Warwickshire County Council from a number of parish councils within its area, the Roads and Bridges Committee recommended that, as there were bye laws dealing with the subject of which it treated, viz., the speed of motor-cars, nothing more should be done. Alderman Bolton King made a temperate speech in support of further instructions being given to the police, and on a division being called his amendment to that effect was lost by the casting vote of the Chairman. Warwickshire people are apparently rather prejudiced, and not only the agriculturist but the huntsmen of the country have proved unfriendly to the automobile. We look to the Midland Automobile Club to educate local public opinion on the subject.

South African Needs.

OUR correspondent at Cape Town sends some suggestions with regard to automobiles from South Africa which will be read with interest and profit by all concerned with the industry. At present the export from this country is of quite miniature proportions, but is likely to advance quickly in some of the

colonies. Naturally, South Africa is well regarded in this connection, and hence the increased interest at the present time attaching to the thoughtful contribution by our correspondent.

The Value of the Motorist.

STATISTICS recently published show that in the year ended March 31st last thirty-two motorists were fined in the East Riding Division of Yorkshire. The fines amounted to £93, an average of about £3 per case. Such enterprise on the part of the constabulary is not only likely to be commended by the ratepayers, but there is a fear that they will urge greater activity on the part of the police. "Here, surely," we can imagine the chairman of the Finance Committee saying to his colleagues, "is a source of revenue into which we should dig deeper, especially as most of the victims live in other counties and cannot vote against us at election times."

The Hooded Van.

THE Tunbridge Wells Town Council has adopted a bye-law requiring every van or other covered vehicle intended to be driven by a person sitting inside to be so constructed with side windows or otherwise as to enable the driver to see the approach of cycles, motor-cars, or other vehicles from behind or on either side. This is a policy we should like to see adopted by councils in other parts of the country. There is no doubt that many of the accidents occurring every day are the result of the carelessness associated with drivers of hooded vans, and the sooner a general application of the prohibitive principle is made the better for all who make up the traffic on the highways.

Good Roads Wanted.

IN the last of his Cantor lectures on "Mechanical Road Vehicles," Mr. W. W. Beaumont, referring to motor-omnibuses, said that if greater speed than that of the horse omnibus, and economy in running were desired, it would be necessary to have lighter cars carrying fewer people than at present. We had not yet enough experience in motor-omnibuses to indicate

The Doctor of the Future—All ready for night calls. (Das Schauferei, Munich)

either qualified success or failure, but there was no doubt that a vehicle had been designed which might be successfully used under proper conditions. There was another form of omnibus which might come to the front in the future, and that was a vehicle electrically propelled by a current received either from an overhead or a side wire. The motor question, in his opinion, was a road question, for upon the quality of roads very largely depended economy in vehicles and working, and even the price of articles distributed by them. As far as vehicles were concerned, there was little doubt

that the development of the internal combustion motor would be so great as, at all events, to retain the place it now had, though the electric car was likely to grow in favour where only short distances were required to be covered. The motor-car for carrying loads from five up to twenty hundredweights had not been, up to the present, as successful as could have been wished. Perhaps too much had been expected of it and not sufficient care had been shown in looking after its mechanism.

The West Surrey Club.

THE West Surrey Automobile Club held a run on the 30th ult., when members met for tea at St. Mary's, Godalming, the residence of Mr. R. W. Buttemer, the Hon. Secretary, and subsequently continued the run to Haslemere. About eight cars were present. On the 6th inst. a general meeting for the election of the committee was held at "Kincraig," Guildford, by the kind invitation of the Chairman, at which the following officers were elected:—Chairman, Rev. A. Armitage; Treasurer, Col. Howard Fairtlough; Committee, Capt. Rouse, Messrs. Wilson Noble, W. G. Crothers, J. F. Ponsford, and A. C. Tesier; Hon. Sec., Mr. R. W. Buttemer. After tea a run was made to Leatherhead and Dorking, in which the following members took part:—Mr. Wilson Noble (14-h.p. Daimler); Mr. E. Pullman, 12-h.p. Durkopp; Rev. A. Armitage, 12-h.p. Darracq; Mr. Buttemer, 10-h.p. Decauville; Mr. W. Maclean and Dr. Wyatt Smith, 9-h.p. De Dion; Mr. Crothers, 9-h.p. Darracq; Dr. Fennings, 5-h.p. Benz; Mr. A. King, 3½-h.p. Benz. Warning had been given of a "trap" at Boxhill, so a funeral procession was arranged for the few miles into Dorking, but the enemy were not to be seen, and the climbing of Coast Hill, 1 in 8, proved an interesting trial, particularly to the weaker members of the party. The "dust question" was much in evidence, and it is sincerely to be hoped that Surrey surveyors will tackle the problem of dustless roads to some effect.

Cars on the Course.

NOT all lovers of horses regard the motor-car with aversion, and those responsible for the various race meetings taking place in different parts of the country are often found most careful in making arrangements for the comfort of motorists who journey to the meetings by road. Recognising the increasing support given by the owners of motor-cars to race meetings, the executive of Lewes Races has decided to provide facilities for the execution of repairs and for the purchase of petrol on the course each race day. A repairing pit has been constructed, and two repairers will attend with a complete set of tools. In order to give this idea a fair trial we learn that the usual admission charge to the carriage enclosure of £1 was suspended in favour of all members of the A.C.G.B.I. attending on Thursday of this week. Should the experiment prove successful, it will probably lead to similar arrangements at Gatwick, Folkestone, Alexandra Park, Plumpton, and other race fixtures under the management of Messrs. Pratt and Co.

A Motor Track.

THE intentions of those who hoped to make Bexhill a centre of automobile interest by reason of a motor-car track having been frustrated, one or two suggestions have since been made that other seaside resorts should thus welcome the motor-car. Blackpool, Clacton, and Southport have each been favourably mentioned and once Lowestoft was to the fore in this connection. The credit of realising the proposal would seem to be reserved for Eastbourne, a fashionable town that recognises the important part motor-cars are likely to play in the future. At the last meeting of the Eastbourne Highways Committee, Councillor Simmons suggested that a motor track should be established there, and we understand that the Town Clerk is now in correspondence on the subject with the Duke of Devonshire, Mr. Freeman Thomas, M.P., and Mr. Davies-Gilbert, the three landowners through whose estates the proposed track would run.

The Paris-Madrid Race.

THE Sporting Committee of the A.C.F. has decided that the Paris-Madrid event shall be considered as "no race," the times from Paris to Bordeaux being only published as a matter of information. Gabriel has been awarded the prize given by the city of Bordeaux for the best time from Paris, and also the cup which the Royal Automobile Club of Spain destined for the winner of the Paris-Madrid race. The examination of the records from the various controls has slightly altered the placings and the times, and the following results are now given as final:—Heavy cars: The first three placings are unaltered, De Crawhez steps into fourth place with 5h. 54m. 11 2-5s., Warden is fifth with 5h. 55m. 30 4-5s. In the light car class the placings are unaltered, but the times are increased by a few minutes. In the voiturette and motor-cycle sections the first five places are unaltered. The Arenberg cup, for the fastest car in the run to Bordeaux using alcohol as fuel, has been awarded to M. Rigolly, who drove the Gobron-Brillié, No. 21, his time being 7h. 44m. This cup was formerly held by M. Rene de Knyff.

The German Daimler Works destroyed by Fire.

A DISASTROUS fire broke out on Tuesday at the works of the Daimler Motoren Gesellschaft, at Cannstatt, Germany, where the Mercedes cars are manufactured. The telegraphic accounts so far received give the number of completed and partly-completed cars destroyed as anything between 60 and 200, these including the 90-h.p. vehicles intended for the Gordon Bennett race. A special meeting of the German Automobile Club was to be held on Thursday to consider the steps to be taken as regards the German cars for the Cup race.

THE competing cars in the Gordon Bennett race will be started at intervals of seven minutes.

MR. C. CORDINGLEY'S Star racing car, and also a 10-h.p. Star car, are among the entrants for the speed events in Phoenix Park, Dublin.

THE Motor Mart, Limited, has adopted some ingenious designs in its advertisements, one of which suggested the illustration with which we introduced our "Comments" last week.

JUST as we go to press we learn that, as a result of representations made by the local authorities through whose districts the cars will pass, the Belgian Automobile Club has reversed its decision with regard to the Circuit des Ardennes, which will now take place on the 22nd and 23rd inst.

THE first heavy vehicle trial in America under the auspices of the Automobile Club of America took place on the 20th and 21st ult. There were fourteen entries, of which twelve put in an appearance, one of which was a five-ton steam lorry sent over by Messrs. T. Coulthard and Company, of Preston. As we go to press we learn that this vehicle has been awarded a gold medal.

ONE of the surprises of the week is the announcement that the Locomobile Company of Great Britain, Limited, have been appointed sole agents for the Oldsmobile petrol car in Great Britain. From now onwards none of these vehicles will be shipped to England except to the Locomobile Company. We are also informed that the price of the car, fitted with the new carburettor, will be £150 net.

AMONG the companies registered during the past week is one with the title Charles Jarrott and Letts, Limited, and with a capital of £10,000, to carry on the business of dealers in motors, motor-cars, etc. The first directors are C. Jarrott (governing director), W. M. Letts, and E. R. Kennedy. As a result of enquiries as to the concern we learn that it has been formed to carry on and extend the motor-car agency business lately established by Mr. C. Jarrott in Great Marlborough Street, W. Mr. W. M. Letts, who has been connected with the Locomobile Co. of Great Britain for the last few years, has resigned his position as managing director of this company to join forces with Mr. Jarrott in developing the business in De Dietrich and Napier cars. We also understand that it is intended to introduce a popular-priced vehicle.

SOUTH AFRICAN NEWS.

[FROM OUR OWN CORRESPONDENT.]

CAPE TOWN, May 15th, 1903.

A BUSINESS trip of 440 miles by motor-car has just been made by Mr. D. Menzies, the chief engineer to the Dunlop Motor Company at Cape Town. The places visited included Caledon, Hermanus, Staddford, Napier, Bredasdrop, Swellendam, and Worcester, and by the ordinary railway and Cape cart the journey would probably have occupied eighteen days. On the coast road near Hermanus Mr. Menzies had to drive the car through twenty miles of heavy wet sand, both he and his passenger having to get out of

Opera Company. There is room for improvement in the roads. Mr. Kitchener tells me that it took six men to slide his car down a drift into the river. The road, beside sloping downwards, tilts at an acute angle sideways to a twenty foot drop over the bank.

Now that the automobile has come into such general use, it may not come amiss to make a few suggestions regarding the construction and fitting of cars for export to South Africa.

The first consideration must undoubtedly be strength. The sudden severe shocks to which the car is subjected when travelling over the rough South African roads render tubular framing hardly suitable. The tubes are liable to get dented or bent. Occasionally, too, sheer drops of sometimes as much as

On the Veldt.

Crossing the Crocodile River.

Camping near a Dismantled-Boer Farm.

AUTOMOBILE SNAPSHOTS FROM SOUTH AFRICA.

[Automobile Welt.]

the vehicle and walk alongside. Just out of curiosity, he asked a farmer what he would charge for a Cape cart and four horses to take them through the sand. He said he would not let his horses go under £10, or 10s. a mile! He thought Mr. Menzies wished to leave the car at his farm, and go on by cart. The car made the 130 miles from Worcester to Cape Town in a little over eight and a-half hours.

I send a snapshot (see next page) taken in Alexandersfontein, 6½ miles from Kimberley, outside Messrs. De Beers' new hotel in that town. The car shown is the "Swift" Messrs. Day and Kitchener, which made the first run from Kimberley to Bloemfontein, the latter being at the helm. The gentleman with the Werner motor bicycle is Mr. Thomson, of the D'Oyly Carte

twelve inches are encountered when touring in the Cape Colony, and when these are approached from the higher level it is often impossible to see them in time to slow down. Drifts and "sluits"—narrow ditches running across the road—make it imperative that, while being light, the frame must be strong and rigid. The frame of the Soames car, described in a recent issue of the *Journal*, seems to me to be very suitable for these roads. In this case, the engine is built in a sort of underframe, which renders it immune from bad road shocks, while it isolates the passengers from any vibration. The driving mechanism should be built as high from the road as possible, as large loose stones are constantly met with, some being so large as to necessitate clearing them out of the way to

C

allow the car to proceed. On most of the country roads the only decent portion is the track made by wagon and cart wheels. The wheels and tires should also be larger than those usually fitted to cars for use at home, and wire wheels are preferable to wooden ones, as they are more resilient, besides which the majority of wooden wheels are liable to shrink.

The question of suitable tyres is too large a one to be dealt with fully here. The statement has been freely made that double-tube tyres were unsuitable for these roads, and that single tubes were better. The argument was that the outer covers of double-tube tyres would be reduced to rack and ruin so quickly as to render the cost of upkeep almost prohibitive. I think that, were this the case, the same remark would apply to single tube tyres. In my opinion, a double-tube tyre with a properly reinforced outer cover is as good as any. Solid tyres are unsuitable. The late Mr. Rhodes had solid tyres on the driving wheels of his 10-h.p. Wolseley, and it was found that they did not sufficiently absorb the road shocks, which were severely felt by the mechanism. The car afterwards passed into the hands of the Rudge-Whitworth Cycle Company here, and is now fitted with pneumatics, with the result that the speed of the vehicle is considerably increased and it rides much more easily. All tyres should be on equal size wheels, and should be interchangeable.

The steering gear must be of the non-reversing wheel type a large steering wheel, and should be stoutly made to withstand jolts.

The steering centre lines should be coincident with the planes of the wheels near the ground, thus making the car practically self-steering like a bicycle.

A Snapshot at Alexanderfontein, South Africa.

Three speeds forward should be provided, and, rather than have the car fast, it should be geared for climbing stiff grades.

Two sets of brakes should be fitted, one on the differential gear, and inside band or rim brakes on the rear wheels.

Lamps are an important item out here when driving at night, and should be very powerful. A red tail lamp must also be carried.

I do not think that, owing to the uncertainty of the water supply in this country, steam cars are at present suitable. The springs are almost all dry during the summer, and during the rainy season are sure to be impregnated with foreign matter, which would corrode the boiler very quickly. All the same, the Royal Engineers used a Locomobile car with marked success during the recent war, towing a trailer, operating a searchlight, firing mines, etc., and it was put to some very hard usage, such as fording rivers and running over the rough veldt.

The third motor-car to visit Mafeking was a 12-h.p. Gladiator from Johannesburg driven by Mr. Atkey, of Nottingham, who was accompanied by Captain F. G. Connock. They left Johannesburg twelve hours later than would have been necessary had they gone by rail, and arrived at Mafeking thirty-six hours before the train was expected—a saving of 48 hours. The consumption of petrol was five gallons, purchased at Johannesburg at 3s. 6d. per gallon, bringing the cost of the trip to 17s. 6d., or under 1½d. per mile.

THE IRISH FORTNIGHT.

At daybreak on a recent morning Messrs. S. F. Edge, C. Jarrott, and J. W. Stocks left London for Holyhead, en route to Dublin and Athy. Each drove a 35-h.p. Napier car, Messrs. Jarrott and Stocks steering the machines they will drive in the race, while Mr. Edge, whose 110-h.p. Cup defender is not yet ready, took over a spare machine, one of four which accompanied the party. A. E. Bianchi and J. Macdonald, who will act as mechanics to Messrs. Jarrott and Stocks, were also of the party.

THE British team is now installed at Castle Rheban, about two miles from Athy, and Mr. Edge bears testimony to the improvement that has been made in the condition of the road since his last visit. The local police are exercising great vigilance with regard to keeping stray animals off the course, in view of the number of motorists now to be seen every day in the district, and at the Ballylinan (Queen's County) Petty Sessions, on Saturday, a number of people were fined in connection with these offences. The magistrate warned the defendants that if they were brought up again they would be very severely dealt with. In one case it was stated that a goat was trespassing on the road at Simmon's Cross, being tethered to a bush on the roadside.

MR ALEXANDER WINTON and Mr. Percy Owen, two of the American team to represent the United States in the Gordon Bennett Motor-car Race, landed from the "Campania" at Queenstown on the 5th and proceeded to Dublin, where four American cars (two racing and two touring) had already arrived. Mr. Harold B. Anderson, Mr. Winton's mechanic, had arrived a few days previously, accompanied by Mr. John J. Jack and Mr. Charles J. Graham, two gentlemen who are connected with the Winton Factory.

WE learn on good authority that the German team for the Cup race will be Baron de Caters, M. C. Jenatzy, and Hieronymous. As regards the French team, it is expected that Fournier will use the Mors car which Gabriel drove so successfully to Bordeaux in the Paris-Madrid race. The Panhard cars to be driven by Messrs. Rene de Knyff and Henri Farman will be the same as took part in the Paris-Madrid race. It is reported, however, that various modifications in them are to be made, particularly as regards the engine, the sloping position of which is, it is said, to be altered.

ARRANGEMENTS have been made by which Monasterevan and Stradbally have been added to Kildare, Athy, Castledermot, and Carlow as control stations, and, consequently, it will be possible, at stated intervals, for the public to cross over the roads at these points, in addition to the other control stations which have already been arranged. This will enable the people to concentrate on such points of vantage as Maryborough Heath, the Rock of Dunamase, and on the high cliffs along the sides of the Windy Gap road. At Windy Gap a large stand is being erected, and one of the finest views of the whole course is obtainable. In addition to a magnificent view of the motor course, seven counties can be seen from it. Stradbally is within easy reach, and this point and the Moat of Ardscoil will be popular.

MR. J. W. ORDE, secretary of the Automobile Club, has visited Athy, and had an important conference with the Urban Council. It was made clear in the course of the discussion that the Club is taking every possible precaution to guard against accidents in the forthcoming Gordon Bennett race. The Council were unable to promise to the Club the services of 100 local stewards in the town of Athy itself, as they were unanimously of opinion that on the day of the race every able-bodied inhabitant of the town would migrate to parts of the course where the cars could be seen at their top speed. It was the opinion of the Council that the police, who have already promised to supply seven of their number for every mile of the open course, should be asked to arrange for the control of the towns. The services of the

military, as at present arranged, will be mainly confined to the Curragh and the Heath at Maryborough.

A LOCAL GOVERNMENT BOARD Order, addressed to the Councils of the administrative Counties of Carlow, Kildare, and Queen's County, and making regulations for the forthcoming Gordon Bennett Motor Race, has appeared in the "Dublin Gazette." The Local Government Board Order requires that when, in accordance with sub-section 1 of the Act, any of the said Councils declare by Order that such of the public roads mentioned in Schedule "A" as are within their jurisdiction shall be used for the said race, such Order shall provide—That from the hour of 6 a.m. on the second day of July, 1903, or on such other day as the Automobile Club with the consent of the County Councils may fix, and until the race is officially notified by the stewards of the course to have been completed, the public roads mentioned in Schedule "A" shall, save as regards such portions of the course as are specified in Schedule "B," be closed to all persons and traffic other than persons appointed by the Automobile Club as official stewards of the course, members of the Royal Irish Constabulary, military on duty, light locomotives engaged in the race and persons in charge of, or directly employed in connection with, such light locomotives. That within the

foreign visitors, as well as the Club members, and on either side of the road fields have been secured, and will be reserved, for the use of the Club members and their friends, where, in marquees, will be served luncheon and afternoon tea. A short distance from the Club stand will be found another stand to seat some 3,000 persons. Between these two stands the racing cars start and also finish, so that it seems that for the occupants of these positions nothing remains to be desired from a sight-seer's point of view. The work of construction is being carried out by Mr. George Langley, of Dublin, from plans by Mr. H. J. Lundy, M.R.I.A.I.

THE Committee of the Yorkshire Automobile Club have made arrangements for their members viewing the race. They have obtained permission to exclusively use a portion of a field near Ardsclull, and commanding a view of over two miles of road. As hotel accommodation on the route is almost unobtainable, camping is being arranged for, providing sufficient members signify their intention of requiring same. Three large sleeping tents, dining tents, and all cooking utensils, etc., have been promised to accommodate fifty persons during the race day, and the night before and the night after the event. The inclusive price for this accommodation on the field per member or friend, exclusive of food

The Gordon Bennett Course—The Junction of the Long and Short Circuits at Athy.

(Lawrence Dublin)

boundaries of each area specified in Schedule "B" the speed of light locomotives shall not exceed ten miles an hour, and that no regulation or prohibition of the County Council totally suspending ordinary traffic on the course or the roads leading thereto shall apply within such boundaries. That each County Council shall require, at such of the points specified in Schedule "C" as are within their jurisdiction, an official to be stationed who shall give notice of the approach of any light locomotive engaged in the race by sounding a bugle or in some other sufficient manner immediately upon such light locomotive appearing in sight.

ABOUT a mile and a half from Athy a grand stand is being erected, from which the competing cars can be seen for three miles, and before which they will pass seven times. In the vicinity are fields for camping-out purposes, which can be secured at about £2 per one and a-half acre.

THE Automobile Club has completed arrangements for the reception of their visitors at Kilrush, where will be constructed across the public road a stand in the form of a bridge to seat 1,000, and on this stand on the day of the great event will be found the Lord-Lieutenant and suite, a number of the

(which will be arranged for and charged at net cost), based on fifty acceptances, will figure out at about £1 per head.

MESSRS. CARLESS, CAPEL, AND LEONARD have just shipped large consignments of petrol to Mr. M. T. Woods, of Newbridge, and Messrs. J. and J. Haslett, of North Street, Belfast.

THE railway and steamer authorities in Ireland should do all they possibly can to facilitate the conveyance of petrol and motor spirit, and it is to be hoped that no unnecessary red-tapeism will militate against the supply of such indispensable liquids.

MESSRS. S. P. COLEMAN and T. H. WOOLLEN will be the official timekeepers in the Gordon Bennett Race.

THE LORD MAYOR OF BELFAST will, on July 8th, give a luncheon to the distinguished foreign and English motorists visiting the northern city, and Lord Dudley has invited a large house party, including the Premier, for the race.

At the last meeting of the Louth County Council the following letter was read:—"To the Secretary of the Louth County Council. *Re* Gordon Bennett Race Cup. Dear Sir—We, the undersigned chauffeurs, beg to lay before your Council the application for permits and licences to drive our cars on the

public roads of the County of Louth at a rate not exceeding fifty miles an hour. We are fully qualified to drive, steer, and repair. Our Panhards are expected daily. We beg to draw your attention to the dangerous condition of the Federard Bog Road, and trust you will see your way to improve same, as that part of the county will be frequented by members of the clubs of different nationalities who intend visiting Ireland, and particularly County Louth.—Wm. Crawley, Laurence J. Curran." Mr. James M'Court said they were both good, reliable men and skilled mechanics. The Council unanimously acceded to the application.

THERE is no truth in the rumour that the Phoenix column, in the Phoenix Park, Dublin, is to be removed in consequence of the speed contests to be held there.

THE Sports Trading Company, Ltd., of Oriel House, Westland Row, Dublin, have a garage with accommodation for about a score of cars, and stock petrol, lubricating oil, etc.

THERE is likely to be good accommodation for motorists at Naas, and quite close to the Town Hall a spacious yard is being fitted up as a garage. Provision will be made for looking after

basis of calculation with regard to the profitable running of motor-cars.

At a specially convened meeting, presided over by Lord Walter Fitzgerald, of the magistrates of the Castledermott Petty Sessions district, through which the Gordon Bennett race will pass, a resolution was passed expressing the unanimous opinion that it "would be most dangerous and indiscreet that any occasional licenses should be granted to any parties in the district for the day of the motor race."

AMONGST the features of the King's visit to Ireland at the end of July, and which (according to the "Freeman's Journal") will probably not be mentioned in the programme, will be an inspection and drive by motor-car over the Gordon Bennett Cup course. This would probably take place in company with Lord Dudley and the Duke of Connaught. The start would probably be made from the Curragh, where the motor-car would be waiting, and the trip would be to Ballyshannon cross-roads and thence along part of the Course.

WE are this week able to publish an illustration of the 90-h.p. Mercedes racing cars which took part in the Paris-

The 90-h.p. "Mercedes" Car—the type which will represent Germany in the Cup Race.

[Allgemeine Automobil Zeitung.]

the cars—a point upon which those leaving cars at garages should insist.

At the last meeting of the Lisburn Urban District Council a conversation arose as to the danger to pedestrians from motor-cars and bicycles going at a high rate of speed, and it was resolved to put up notices of warning in the public park, and to call the attention of the police to the practice.

MR. ROBERT MANNIX, of Dublin, suggests that at the sharp corners where dust is likely to be a source of danger in the Gordon Bennett race, the experiment of treating the road with boiled flax seed should be tried. Flax seed, thoroughly well boiled, and afterwards diluted with water, will, he suggests, hold the particles of dust together better than any other substances that could be used.

UNDER the Railways (Ireland) Act, 1896, coach and steamer services have been established under Government subsidies as follows:—Coach services between Tarbert and Listowel and Rooskey and Dromod, all the year round, and between Ennislymon and Ballyvaughan between June and September. Steamers are also being run between Tarbert and Kilrush and Sligo and Belmullet. The coach services are proving of great service to the localities through which they run, and may possibly afford some

Madrid race, and which it is understood will represent Germany in the forthcoming Gordon Bennett race. Only six of the vehicles have been built. The engine is practically identical with that on the 60-h.p. car already illustrated in the *Journal*, except that it is larger. The bore of the four cylinders is 165 mm., and the stroke is 150 mm. The inlet valves are, of course, mechanically-operated and the honeycomb radiator and tank is retained. The dash-board has been considerably modified in shape, and, as will be seen, does not project above the bonnet. The seat is unusually far back, being but little in front of the rear axle, with the result that a much greater "rake" has had to be given to the steering column. It may be mentioned that the fly-wheel of the engine is located at about the centre of the frame, while another point to which attention may be drawn is the new form of the front wheel mudguards. The wheel base of the vehicle is nearly 10 ft., and the wheels, which are of equal size, are shod with Continental tyres.

MOTORISTS going to the Giant's Causeway will find a garage at the Northern Counties Hotel, Portrush, under the management of Mr. Frank Cox. Pratt's motor spirit is also stocked in Portrush under his personal supervision. This is on the Belfast and Northern Counties Railway, whose circular tours will doubtless be taken by many sightseers without cars.

CONTINENTAL NOTES.

"BY AUTOMAN."

GRADUALLY, as the levelling effect of time brings down to their just proportions the facts connected with the unfortunate Paris-Madrid motor-car race, which will always have the distinction of being the last great open international motor-car test, the calm and unprejudiced minds are beginning to see how eventually good cometh out of evil. The growth of the motor-car industry has been so remarkably rapid, that mistakes were sure to creep in. It was an error of judgment on the part of the Racing Committee of the A.C.F., which has been the leader of the whole world in this matter, to allow the Paris-Madrid race to be held without stringent precautions, which were totally unnecessary in the case of the Paris-Berlin or even Paris-Vienna, but which became essential as the speed and number of the cars increased, and also as the public interest in the race grew.

It was a mistake to start the race on Sunday. The object of it was the further popularisation of the motor-car by giving everyone near the line of route a chance to see the race without neglecting the work that brings in his daily bread. It was due to this in a great measure that there were such crowds every-

The Cars at Zarauz, Spain.

therefore every event must now be surrounded with every precaution, in order that the public alarm may be calmed down, and road-racing may survive its great trial.

THE Ardennes race will be held some three months later, and will be limited to a certain number of competitors, say forty. These forty will be chosen after eliminating trials, so that the difference of speed between the different competitors will not be very great, and passing will be reduced to a minimum. The roads will be roped from start to finish, and no one allowed on the course. The place for arrival and starting will be fixed away from agglomerations, and the severest regulations will be made in order to ensure a successful event. The congratulations of the automobile world are due to the Belgian Club for having taken this wise course, and the result will be greater prominence for their competition.

THE "Auto," in writing of the Paris-Madrid motor-car race, has made an analysis of each of the three great weight categories in the motor-car section. This tends to show that weight tells, and that the heavy car is the most reliable vehicle of the three classes, for more than half of the cars that arrived in Bordeaux belonged to this class, the numbers being, 52 heavy cars, 26 light cars, 21 voiturettes.

Madame Lockert on 12-h.p. Ader Car at the Fishing Village of Ondarra, Spain.

THE TOURIST SECTION OF THE PARIS-MADRID RACE.

where along the roads. It was an error of judgment, too, this time not quite so pardonable, not to have caused strict police instructions to be issued, ordering all dogs near the line of route to be kept on the chain, and threatening penalties against those who neglected this precaution.

THE result of this neglect was disaster, a disaster which threatened and still threatens, to injure materially the motor-car industry. However, on every side, there seems now a tendency to come back to the logical conclusion, and submit automobile road racing to the proper precautions, which will bring it into line with all other kinds of sporting events. The result will be that this new sport will take its proper place amongst other pastimes, and become recognised all over the world.

THE first signs of the good that will come out of the terrible experiences of Paris-Madrid emanates from Belgium, where the A.C.B. has wisely postponed the "Circuit des Ardennes," which was to be held towards the end of this month. They have not postponed it because they think that it would have led to accident, but they have, in wise, sportsmanlike fashion, postponed it for the simple reason that any further mistake now made would seriously compromise the future of automobile road racing, and

OUT of the fifty-two heavy cars that arrived in Bordeaux, that is to say, that accomplished three-sevenths of the Paris-Madrid course, Mors has the unqualified victory, for not only was the winning car a Mors, which accomplished the distance at the rate of a mile a minute, but the second place also fell to Mors. Out of the fifty-two cars, not less than seven were Mors cars, whilst out of the first nineteen of the fifty-two, Mors counted five places, and the Dolphin car—for the Mors wind-shield makes the car look just like a dolphin—is the victorious vehicle of 1903. Dietrich comes next, with the third place in the whole race, and six cars out of the fifty-two. Panhard and Mercedes divide between them the honour of having the largest number of cars arrived, that is to say, nine of each out of the fifty-two. Panhard takes the fourth place, and he is not as well placed as he has been in races in preceding years. A curious detail with regard to this is that for the first time lubrication has been the trouble, and this, no doubt, was due to the inclined engine, proving once more that the vertical engine is the only one which lubricates successfully under all circumstances. Mercedes takes the 5th, 7th, 11th, and 12th places. Serpollet has the distinction of being the only maker all of whose cars got in. Seven started and seven arrived. The four C.G.V.'s arrived, the first, driven by Voigt, being placed sixth, whilst two out of the

four were touring cars. Three Gobron-Brillies, with their high-powered engines, arrived, and two Pipes.

IN the light car class Louis Renault, of course, was nearly one hour ahead of everybody else, but all the other drivers of Renaults stopped at Couhe-Verac at the bedside of their dying comrade, Marcel Renault. Five Darracqs out of the first ten cars to arrive makes a splendid record. Decauville takes the 3rd and 6th place with the two cars which arrived, whilst a little De Dion-Bouton came in 5th, and another 9th.

IN the voiturette section, the progress which has been accomplished this year is the most remarkable, for the little four-cylinder Clement accomplished the journey to Bordeaux in 7 hours and 14 minutes, an average speed of nearly 47 miles an hour. The four-cylinder Georges Richard came in 2nd, and shares with Clement the victory of the day; for the 2nd, 4th, and 15th places fell to these little cars, whilst at Angouleme,

in trying to avoid him that Georges Richard met with his accident.

WITH regard to the voiturettes, an interesting story is told, to the great credit of the driver of the Boisse voiturette, No. 226. Having arrived at thirty kilometres from Bordeaux, his accumulators gave out; but, undaunted, he walked five kilometres to the nearest town, sought out a half-discharged accumulator, got back to his car, and finished the race.

THE Belgian Minister of Public Works has informed the A.C.B. that the new road between Ostend and Dunkirk, via Neuport-Furnes and Ypres-Menin, is now open for motor traffic.

ARRANGEMENTS are now well in hand for the International Automobile Congress which is to be held at the A.C.F. Club-house in Paris next week. In view of the accidents in the Paris-Madrid race, however, it has been decided not to hold the

Messrs. Joseph and Edouard Ravel on their 15-h.p. two-cycle Petrol Motor-Car.

[L'Avenir de l'Automobile.]

where the accident happened to Georges Richard, he was right at the head of his class. The Darracq voiturette takes the 3rd place, but only two Darracqs arrived. De Dion takes the 5th place and has three cars to arrive, whilst Ader has the distinction of the greatest number of cars, that is to say, four, to arrive.

REFERRING to the accident mentioned above, which occurred to Georges Richard, it is of all the accidents perhaps the most unfortunate from the point of view of the driver of the car, whose object was to make a good race at the head of his class. Without the slightest trouble, and everything going as merrily as a summer day, with the prize almost within his grasp, Georges Richard had the misfortune to be singled out by a blackguardly brute amongst the spectators who had made a bet that he would touch one of the racing cars as it passed. As the big cars came along his courage failed him, and it was not until the first of the voiturettes came in sight that he screwed his courage to the striking pitch and advanced to win his bet. It was

fetes set down in the programme in connection with the Congress, which will be brought to a close by a banquet on the 20th inst.

M. J. RAVEL, a well-known French engineer, has recently been devoting much attention to the question of two-cycle petrol motors, that is to say, an engine in which an explosion takes place at each revolution of the crank shaft instead of every second revolution in the four-cycle engine. As a result of his experiments he has constructed a double-cylinder two-cycle motor and fitted it to the car shown in the accompanying illustration. The engine develops 15-h.p. at a speed of 900 revolutions per minute; the cranks are set at an angle of 180 degrees to each other. There being an explosion at every revolution in each cylinder, there are 1,800 explosions or impulses per minute. He thus claims to get the same result from two cylinders as from a four-cylinder engine of the ordinary type. Not only so, but M. Ravel states that the consumption of petrol is reduced, while the motor shows less tendency to over-heat.

MOTOR-CYCLING NEWS.

TO-DAY (Saturday) the Wolverhampton Motor-Cycle Club will hold a run to Worcester, and the Glasgow Club one to Stewarston.

A NOVEL feature in the 1903 Ormonde motor-bicycle is the method adopted of lifting the exhaust valve. Referring to the accompanying illustration, instead of the usual rocking lever, a rotating circular piece, 18a, takes a seating on a similar shaped washer, 18b, having cut in its upper surface an inclined plane in which the top piece correspondingly fits. Attached to this is a short arm to which a Bowden wire is fitted, and also a check spring. This short arm works on a pivot on a lever 19 formed

in one with the piece 18a. On the arm being actuated by the Bowden wire the top piece 18a slides up the inclined plane and holds the valve open. In normal position, the valve shut, electrical contact is made between the lever 19 and the terminal 19a, which is attached to an insulated plate, 20. The first movement of the twist handle breaks the electrical circuit, the further movement lifting the exhaust valve, the company preferring this compound arrangement to that in which the current is left on whilst the valve is lifted.

THE Inland Revenue authorities at Bristol are very active with regard to the licensing of motor-cycles, and have just taken action against Mr. F. G. Rowe for keeping such a machine without a licence. At the police-court hearing Mr. B. Hawkins, from the Revenue Department, London, appeared on behalf of the Commissioners of Inland Revenue, stating that the carriage the defendant was charged with keeping without a licence was a motor-bicycle, and they said it came within the Acts relating to the licensing of carriages on two grounds. First, it was included in the general charge of duty upon carriages; and, secondly, even if that were not sufficient to bring it in, it would be brought in by the Locomotives on the Highways Act of 1896, under which these vehicles might now be used. The Act under which the prosecution was taken was 51 Vict, Ch. 8, Section 4, and the carriage was defined in Sub Section 3 of the Act. The vehicle came within those "propelled by mechanical power" or "any other carriage." He quoted the case of Cannan v. the Earl of Abingdon, in 1900. The defendant said he did not own a motor-bicycle, but traded in them. The manufactory was at Birmingham, and he was assistant manager at the Bristol depot. He had to sell cycles to clients, and if anything went wrong he had to ride the cycles for the clients to see what was wrong. They rode cycles to the purchasers' homes, and machines were also ridden to see if they met with their clients' approbation. He did not keep a special machine for his own use, and used motor-cycles in the way he had described only. He thought the dealers would be exempt in the same way as carriage builders. The magistrates said the defendant had not proved the facts he mentioned, but had merely made an assertion. He would be fined 20s. and costs.

At Cheltenham, last week, Bert Yates, on a 2½-h.p. Humber, rode a mile from a standing start in 1 minute 55 2-5 seconds and with a flying start in 1 minute 46 2-5 seconds, the latter being a record for the track. E. H. Arnott also made an attempt on the Paddington track to make a 200 miles non-stop run on the Werner motor-bicycle used by him in the Paris-Madrid race. Arnott, however, had to retire after covering about 40 miles.

THE subject of the conveyance of motor-cycles by rail is now under the consideration of a committee of the Auto-Cycle Club in conjunction with Mr. T. H. Woollen.

THE Metropole Cycling Club and the New York Motor-Cycle Club are organising a motor-bicycle contest from New York to Boston and back, a distance of 472 miles, for July 3rd, 4th, and 5th next. The day's runs will be, respectively, 161, 150, and 161 miles. The objects of the contest are to demonstrate not only the reliability of motor-bicycles, but "the endurance and judgment and the ability and skilfulness of riders in their operation and care." The latter will be developed by the rule which makes it incumbent on the riders to make all necessary repairs on the road, and not in the control at night. The machines will not be permitted to be touched after the arrival of contestants at the night's destination. The contest will be open to motor-bicycles only, classified according to power. By the term motor-bicycle it is understood that they be equipped with cranks and pedals, and in condition to be driven by pedal propulsion if occasion requires. Each contestant may pedal at any time without penalty. The machines entered will be classed as follows: Class A, motors under 2½ horse-power; Class B, motors of 2½ horse-power and over.

A COPY of the prospectus issued by the Motor-Cycling Club has been sent us. It sets forth the aims and special features of the club, and should prove a useful production to intending members, who will be supplied with a copy on application to the Secretary, Mr. G. E. Roberts, 7, Fieldhouse Road, Hyde Farm, Balham, S.W.

THE accompanying illustration depicts Mr. J. Edge, the captain of the Liverpool Motor-Cycle Club, ready to take a friend for a run on a Humber motor-tandem. Mr. Edge, who is one

of the most enthusiastic motor-cyclists in the Liverpool district, writes: "I am always trying motors, either for fun and experience or for some of the club members, and I think I have ridden most of the makes on the market. I have just got a Bat down for my own use. Will let you know how it goes on later. Any information I can supply is at the service of your readers."

MR. EDGE also informs us that his club, finding that there are sufficient Humber motor-bicycles among its members to enable it to take advantage of the Humber Company's offer of a silver cup, has decided to apply for one, and to hold towards the end of the present month a hill climb, the first prize being a gold club badge and the cup (to be held for one year), and the second and third silver badges. Motors up to and including 2-h.p. to be allowed to pedal; over 2-h.p. not allowed to pedal. The course selected is the celebrated Parbold Hill, near Ormskirk.

SOME NEW PETROLEUM-SPIRIT MOTORS.

AMONG the many small petrol-motors recently introduced in France is that of Messrs. Monnier, May, and Co., of Puteaux, and illustrated in Figs. 1 and 2. One of the special points about this motor is the cylinder, which is cast in

Figs. 1 and 2.

one piece with the head. The position of the exhaust valve *B* is rather unusual, being above the inlet valve. This arrangement is claimed to possess the advantage of not heating the head, and also facilitates the exhaust, being close up to the combustion

Figs. 3 and 4.

chamber. The exhaust valve is opened by a cam *E*, which lifts a rod *I*, linked to a pivoted lever *J*, engaging the valve stem *C*. When the valve is opened by the lever *C*, the spring *D* is compressed, the closing of the valve, when the pressure on the lever is removed, being effected by this spring resuming its

normal position. The inlet valve *D* is immediately below the exhaust, and is so arranged that it can be readily withdrawn.

Figs. 3 and 4 represent another new type of petroleum spirit engine recently devised by two French engineers, Messrs. Lucas and Villain. The arrangement of the valves and the plug directly on the cylinder-head necessitates but a single joint in the cylinder. The admission-valve *c* opens on the intake stroke of the piston and is reseated by means of the spring *c'*. The exhaust valve is operated by a pinion *f*, secured to the motor-shaft *g*, meshing with a gear *h*, the sizes of pinion and gear being in the ratio of 1 to 2. The gear is provided with a cam *i*, with the peripheral surface of which a friction-roller *j* is always in contact. The roller is mounted on a cap *k* on a rod *l*, operatively connected with a lever *m* fulcrumed on a support *n*, to actuate the exhaust-valve stem. The exhaust-valve, like the admission-valve, is reseated by means of a coiled spring *o*, and a similar spring forces the roller *j* constantly into engagement with the cam *i*. The explosive mixture of air and gas is led from the carburettor by means of the pipe *r*, the sparking plug being located at *e*.

THE REQUIREMENTS OF A TOURING CAR.

THE touring car, as its name implies, is a vehicle specially designed for country work, but how many of the touring cars now offered to the public as such fairly satisfy the special demands made on such a car as compared with a vehicle for short trips and for town use only? When a tour is made in an automobile the daily trips are longer and the average speed is generally higher than in ordinary pleasure runs, and to avoid any discomfort of the tourists the seats must therefore be particularly roomy and comfortably upholstered, and special means must be provided for protection from the inclemencies of the weather, mud thrown off by the wheels, etc. Unusual road difficulties are frequently encountered in touring, and a touring car must be of relatively higher power than a vehicle for town use. The majority of the better-known touring cars leave nothing to be desired as regards power so long as the engines are in good order. Where the present touring car is more or less defective is that it does not provide room for the many things usually carried along on a tour. With many automobilists an extra tyre or outer cover is one of the most essential extra parts to be carried, and at present the only manner of carrying the tyre is to strap it either to the front or rear of the body, where it is rather too conspicuous to suit the taste of the aesthetic user.

In France numbers of touring cars have been built with a limousine body, the top of which is surrounded with an iron railing to serve for carrying extra tyres and luggage. This arrangement provides a fairly suitable and inconspicuous place for the tyres. In cars with ordinary tonneau or two-seated body the best place for the tyres undoubtedly is beneath the floor of the body in the rear, provided that space is not occupied by some other part, as, for instance, the silencer or the water tank. The "Horseless Age" makes a suggestion which has already been adopted by one or two concerns in this country, viz., that a drawer should be provided beneath the floor of the car to accommodate an outer cover and a number of spare tubes. If a rear step should interfere with drawing it out, the tyres could be placed in a box of drawer form hinged to the body, the rear end of which could be let down to remove the contents.

Owing to the impossibility of carrying dress cases, etc., on some cars, it is not uncommon for tourists to send a trunk along by rail, but it is hardly necessary to say that this method is far from being ideal. The luggage question for touring cars can be solved in two different ways—viz., the body of the vehicle may be provided with compartments for storing the various articles it is desired to carry along, or provision may be made for strapping a neatly-fitting trunk, readily removable. The latter would really seem to be the preferable plan, as it would allow of the trunk being carried into hotels at stopping places and would leave all the room of body compartments for extra parts and tools, which must be carried in considerable number on long trips.

HERE AND THERE.

A MOTOR-CAR service between Dromara and Ballynahinch, Co. Down, is being advocated in the Irish journals.

For the first time in their annual design competition, the Coach Makers' Company are offering prizes for drawings of the motor-car.

A CORRESPONDENT, reverting to Sir R. Payne-Gallwey's suggestion for shooting motorists, proposes that the shots should be fired at the tyres, not at the drivers.

A MOTOR-WAGGON belonging to the Tadcaster Tower Brewery Company, of Wakefield, ran into a wall, and, crashing through it, fell bodily into a field some six feet below the road.

THE accompanying illustration shows one of the Star latest four-cylinder 10-h.p. light cars, fitted with collapsible canopy head. The cylinders are $3\frac{1}{2}$ -inch bore by $4\frac{1}{2}$ -inch stroke; automatic inlet valves are used, while a governor acting on the carburettor controls the speed of the engine. Four speeds forward, and a reverse actuated by one lever, are provided. The car is both silent

The "Star" 10-h.p. Four-Cylinder Car.

and fast, the speed ranging to well over forty miles an hour. The weight of the car comes out just under 17 cwt. The canopy head, which in the illustration is shown closed, affords an excellent protection against dust. Altogether the vehicle is one which does credit to its builders, the Star Engineering Company.

THE Edinburgh Motor-Omnibus Syndicate, Ltd., has been registered with a capital of £3,000 and with offices at 63, Frederick Street, Edinburgh, to carry on the business of proprietors of motor-vehicles of all kinds.

MR. A. W. RICHARDSON, of the Skew Bridge Works, Patricroft, Manchester, sends us particulars of a new slow-speed, direct-acting, high-pressure boiler-feed pump he has lately introduced for use on steam-cars and heavy motor-wagons. The whole of the working parts are enclosed, the pump being arranged for fixing to the framing, bunker, tank, etc. The whole of the water end and the steam valve end is constructed of brass, whilst the rods are of manganese bronze. Each pump is made complete with steam regulating valve, lubricator, drain cock, and union tail end connectors for steam and water pipes.

THE Eastbourne authorities are inviting tenders for the supply of Clarkson motor-buses with outside seats.

At the Cart Horse Parade Sir John Willoughby made a fierce oratorical onslaught on "those Juggernauts called motor-cars."

A COMMITTEE of the Scottish Chamber of Agriculture is to be formed to make suggestions with regard to the future of automobilism.

THE Bradford Motor-Car Company have lately been prominent in their district, having supplied motor-cars in connection with a local wedding, and also a walking match from Bradford to York.

On the 2nd inst. Mr. J. T. Overton, of the Motor Volunteer Corps, drove the Inspector-General of Fortifications to Hounslow and Windsor, on inspection duty. On the same day Mr. E. H. Clift drove General Lord Grenfell, Commanding 4th Army Corps, and Brigadier-General Eyre Crabbe to Tilbury, in connection with night operations on land and water. Further enrolment took place at headquarters on Tuesday last for the London command of the Motor Volunteer Corps.

TO-DAY (Saturday) the Wolverhampton Automobile Club will have a run to the Rudyard Hotel, Rudyard, under the captaincy of Mr. W. Baker.

THAT the motor-car is beginning to attract attention in Japan is evidenced by the receipt of a catalogue of motor-cars from Messrs. Bruhl Freres, of Yokohama. The list is printed in the Japanese language, and 3,000 copies have been distributed. About twenty-five types of vehicles—steam, petrol, and electric—of American, French, and English construction are illustrated. Altogether there are sixty illustrations, the majority being of American cars.

FROM Phillips, Ormonde and Co., Melbourne, we learn that Messrs. Thomson and Day, of Adelaide, recently made a successful trip between Adelaide and Melbourne in a De Dion voiturette. The overland route has been frequently regarded as impracticable for vehicle traffic owing to the ninety miles of desert between Meningie and Kingston, but it has surprised many to learn that, at a cost of only 46s. for fuel, the distance of 596 miles between the two capitals was covered in thirty-eight hours of riding time.

A VERY useful tyre putty has just been brought out by the Continental Caoutchouc and Gutta Percha Co., which has already met with much approval on the Continent. For the temporary repair of motor tyre covers this putty offers many advantages, especially when the hole in the cover is a large one. For repairing according to the new method, the cover is detached and the inner tube repaired in the usual manner. The cover plaster is then placed on the inside of the cover over the damaged place, with both ends overlapping the edges of the cover, as shown in Fig. 1. The plaster is solutioned, and will

Fig. 1.

Fig. 2.

Fig. 3.

stick on the inside of the cover. The tyre is then put on the rim again, care being taken to have both ends of the plaster jambed between the edge of the tyre and the rim. The tyre is then inflated to a pressure of about 15 lbs. per square inch, and the "Continental" tyre putty, Fig. 2, buckled securely to a spoke, and rolled scale shape round the damaged spot. The other end of the putty is buckled to another spoke, Fig. 3, and thereupon the tyre may be inflated to the full extent, and is ready for use.

ACCORDING to the annual report of the Patent Office, there was a great increase last year in the number of applications for automobile patents.

SOME of the warehouses of the Dublin Port and Docks Board are being made available for the accommodation of motor-cars during the Irish Fortnight.

A PUBLIC motor-car service has just been started between Nuremburg and Heroldsberg, Bavaria. The vehicles used are of the Maurer-Union type, with seating capacity for eleven persons.

THE hill climbing competition announced to be held to-day (Saturday) by the Midland Automobile Club has been postponed until Saturday, July 25th.

MESSRS. FRANK F. WELLINGTON, Limited, are about to open their new showrooms at 151 and 153, Wardour Street, Oxford Street, W., their lease at 36, St. George's Square, Regent's Park, having expired. They will have cars of the Brooke, Panhard, Clement, and other well-known makes in stock.

THE Corporation of Maidenhead have made arrangements for charging the batteries of electric motor-cars at the power station in Braywick Road, about three minutes' run from the main Bath Road. A charge of 2s. is made for connection and attention, and 3d. per unit for electricity supplied by meter.

THE C.T.C. has decided by vote that automobilists shall not be admitted to its membership. That is to say, that unless the applicant can sign the declaration that he or she can ride a pedalled cycle of some sort he or she is not eligible. It is not, however, a necessary qualification that the applicant is actively pursuing the pastime. Automobilists who have been cyclists, and who could ride bicycles if they had them, appear to be eligible to participate in all the benefits the club offers.

MR. W. A. VINCENT has established a garage at Cauldon Bridge, Stoke-on-Trent.

A REGULAR motor-car service has been started between Mafeking and Johannesburg.

THE new motor fire-engine for the Liverpool brigade passed through Coventry the other day, and Captain Armishaw, of the local fire brigade, rode upon it as far as Lichfield.

RECENT registrations in Guernsey include the Continental Automobile Company, Limited, with a capital of £20,000, in £1 preference shares and £40,000 in £1 ordinary shares, and the F.I.A.T. Motor Agency, Limited, with a capital of £40,000 in £1 shares.

"ON TOUR WITH A TRAILER" is the title of a pamphlet just received from Messrs. Mills and Fulford, of Coventry. It gives an interesting account of a trip in which one of their trailers formed an apparently indispensable accessory, and should do something to convince motor cyclists of the practicability of their specialities.

As a result of an order recently issued by the Canadian customs officials, no more American automobilists will be permitted to go into Canada with their cars without paying full duty on the same. The duty is 25 per cent. of the assessed valuation of the car, and this amount will be collected each time a machine is taken into Canada. The order has been issued, it is said, because American manufacturers made a practice of sending automobiles into Canada ostensibly on pleasure trips, and then selling the vehicles there, thus avoiding the payment of duty. Many motorists in Buffalo have summer residences in Canada, and this order will prevent them from driving to and from them. An endeavour will be made to arrange whereby the short trips into Canada, which have been such sources of pleasure to motorists, may not be interrupted this summer, or at least, that persons owning summer residences in the Dominion may be permitted to go to and from them without paying duty.

THE Gordon Bennett clock, as shown in the accompanying illustration, is one that Messrs. S. Smith and Son have specially made for the race. The case is made of brass, the diameter 12 in. and the dial 10 in.; the three eyes at the back of case are for fixing. The movement is constructed so as withstand vibration, with a lever escapement so that the clock will go in any position. The dial is distinctly and accurately marked, the

important feature of the clock being the addition of the centre seconds hand. These clocks are to be used at the entrances and exits of the controls, and by having the centre seconds the time-keeper can take times to one-fifth of a second; they have been carefully adjusted; and of the large number ordered officially nearly all have been bespoke by members of the Automobile Club.

CORRESPONDENCE.

ECONOMICAL MOTORING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to your paragraph "Economical Motoring," I can endorse Major Matson's views entirely. I have been running a 7-h.p. Belle car for the last six months, in all weathers, and have found it quite satisfactory in every way. The total cost of everything spent on car was £6 1s. 8d., and the mileage run 1,843, which works out to 3d. per mile. I had solid tyres, belt for first drive from engine to gear box, and engine set at an angle of 45°. I never was stopped on the road for any troubles, and the car with four people could do twenty miles an hour on a main road, although my usual pace was twelve miles an hour on the bad bye-roads. The belt was never the slightest trouble, and I did nothing but apply castor oil occasionally. I always drove myself, and a gardener washed the car when necessary.—Yours truly,

H. J. BATH.

INFORMATION WANTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—"Faber" wants to know if I always take a slow train to town in order to be able to enjoy the sight of the country? No! when I go to town by rail my object is to go quickly, and so I choose a fast train. The railroad is for people who need to move speedily. It is the very place that has been specially constructed for speed. The public highways are not for—and have not been constructed for—fast motors.

If only the motorist would allow himself plenty of time to go to the station (which he could easily do if he liked, though he may pretend he

and another thing to be noted is that the excessive cost—initial and upkeep—of such cars is prohibitive to nearly all for pleasure purposes, and for the commercial world cars built for anything like this speed would be detrimental to the goods conveyed, the dividends of the concerns, and the community at large.

We also observe in your "Continental Notes" that some automobilists intend to prosecute dog-owners for allowing their dogs even to run behind a car. We should rather like to know whether this is intended seriously, or if selected from a comic paper, because, if it is intended to represent the actual state of affairs, we should like to know why dogs should have a monopoly of this sort, when there are so many other candidates; we presume that cats, pigs, fowls, and other members of the farmyard are allowed the same licence in Austria as in this country, and we are prepared to state that any member of the canine tribe who cares to try conclusions with one of our cars is quite welcome to do so; we have no doubt as to the result. The next thing we are likely to hear, judging from the present state of affairs, is that the general public will be chained up during the Gordon Bennett race.

Trusting that other manufacturers will give their views and experiences.—Yours truly,

JAMES RICKARD AND CO.

A SUGGESTION RE TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will you kindly allow me to ask why it is that manufacturers of motor tyres do not keep their tyres for, say, a week at least, stretched on the size wheels they are intended for? To have to struggle with new tyres is a great trouble, and no one would object to tyres which had been stretched sufficiently to at least fit the wheels they are supposed to be provided for. Sometimes hours are spent trying to get new tyres on, and damage is often caused to tubes.

The Circuit National Belge—The Start from Brussels.

[La Presse Automobile.]

forgets), he would then bring a useful vehicle into great favour, and save himself being hated by all the country side through which he passes.—Yours truly,

VILLIERS LUCAS.

MOTOR-CAR RACING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We have perused with much interest "Automan's" notes on the Paris-Madrid race, and as manufacturers, thoroughly interested in the future of the motor industry, we must confess that we do not agree with his views. The easy manner in which your article accounts for so many fatal accidents is somewhat inhuman—at least, that is our humble opinion. It is not at all surprising that so many accidents did occur, but rather that they were so few, when we see and hear of 90-h.p. cars being constructed to carry two persons; every engineer knows that 4-h.p. is quite sufficient to carry two persons at the legal limit. You say "without road racing the automobile industry of to-day could barely be said to exist"; we contend that road racing does not in any way tend to further the industry, but, on the other hand, exhibitions and utility trials are extremely beneficial, both to the manufacturer and the public. What is really wanted is a sound, reliable machine, not these monstrosities. From a manufacturer's point of view it is absurd to suggest that these high-powered machines can do the trade any real good, because it must be apparent to all that only a few "cranks" could be found willing to drive cars of such high power and speed,

Also will you kindly allow me to ask, why is the motor trade, in appearance at least, so fearfully democratic? In this matter I do not refer so much to manufacturers as to agents, and especially repairers. The latter always give one the idea that "Jack is a good deal better than his master." I do not think perhaps that they mean to be so, but many of these men speak to gentlemen in a way that formerly no carriage-builder would have dreamt of speaking. Is it any wonder, then, that many gentlemen say they will not be mixed up in such a game? They have more respect as private gentlemen, and are probably tempted to put their heel on it.—Yours faithfully,

A. M. C.

PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I understand that petrol of a specific gravity of .700 or even greater density is now being put on the market, and that is as suitable for use in the ordinary motor as that of .680. In this case the densimeter will be of no use to ascertain if a sample is suitable or no. Could you kindly let me know some rough and easy method of ascertaining, when out on the road, if a sample of oil is of suitable quality to use in the ordinary pattern motor, and also a method by which a person with a fair knowledge of chemistry might test it at home? At what temperature does ordinary kerosine oil boil? If the carburettor were kept warm—say at 180°—is there any reason why it should not be used with an ordinary motor; and what pattern carburettor would be the most suitable?—Yours truly,

C. J. S. B.

THE LOHNER-PORSCHE COMBINATION PETROL ELECTRIC CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I recently had the pleasure of conversing with the owner of one of the above-mentioned carriages, and was informed by him that the combination is most delightful from a driving standpoint in many ways. In the first place, the motion is very smooth and pleasant, and may be compared to the gliding of a boat through the water. There is also a complete absence of jar or noise in changing speeds. This is not surprising, when one considers that there are no speeds to change—that is, in the generally accepted sense of the word. All that is done is to admit more current from the dynamo to the electric motors, of which there are two, these being built up in the hubs of the front wheels. The forward drive is described as one of the nicest features of the combination. It is practically impossible for the car to sideslip, and, in addition, there is no necessity for a differential gear; on the other hand, I understand that the motors are too small to permit of a sufficient amount of power being applied to them to start the car on a steep hill. This is rather a serious drawback, but one which no doubt can be overcome. Then, again, the weight of the dynamo is very considerable, as I was given to understand that this is approximately $4\frac{1}{2}$ cwt., which is very much more than the weight of the gearing, chains, and differential of the average car. Not the least source of trouble, too, is the number of electrical connections in the car, the total being something between 110 and 130. A casual inspection of these seemed to show that, like the average electrical connection most of us are familiar with, they are not too well made. On asking my friend as to how long these connections lasted, he sadly shook his head, and remarked, "I replace one at least about every twenty miles." The dynamo brushes, too, have to be replaced about every 100 miles. The drive is controlled by a lever situated immediately under the steering wheel, which lever governs six forward speeds and reverse motion, and one electric brake; in addition, there is a foot-applied electric brake, which cuts out the current from the dynamo at the moment of application, and also the usual hand-applied brakes acting on the rear wheels. The petrol motor is a special size Mercedes type, giving about 26-h.p., with fan-cooled honeycomb radiators, throttle governing, etc.

While there is no doubt that as an adjunct to a stud of cars these vehicles are both interesting and instructive, I understand that they are not fast, or at least not exceptionally so, nor are they particularly good hill-climbers, this being probably on account of the excessive weight necessary for the purpose of generating the current, and the comparatively small size of the electric motors used. The car has undoubtedly a charm of its own, but appears to entail a considerable amount of work to keep it running satisfactorily.—Yours truly,

G. B. P.

A CANINE MECHANICIAN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Thinking it may interest the readers of your *Journal*, I enclose photo of my new 10-h.p. Cottureau car, showing my canine mechanician,

"Jack," seated on the bonnet, fully begoggled, and quite oblivious to the roaring of the engine underneath him. He is the best remedy I know of for keeping "hands off," and inquisitive people at a distance when the car is stationary, and I advise all car-owners to train a small, sharp dog for this purpose. The animal is also a source of amusement to the passengers, and relieves the monotony of a long ride.—Yours truly,

"DRESDEN CHINA."

LIGHTS AT LEVEL CROSSINGS.

IN the Elgin Small Debt Court recently, before Sheriff Webster, Arthur Whaley sued the Highland Railway Company for £12 for damages to his motor-cycle through coming against a gate at a level crossing, owing, it was alleged, to the lights of the gate having gone out. It appeared that the plaintiff and another motor-cyclist were riding on motor-cycles on their way from Nairn to Forres late on the evening of March 13th, and the plaintiff, who was unacquainted with the roads, took a wrong turning. At a short distance from the main road he came against the gate, with the result that the front part and engine of the cycle were seriously injured. The cost of repairing amounted to more than the sum sued for. Neither of the riders thought that the light would have gone out by the force of the collision, but both of them admitted that there was a good acetylene lamp on their machine. Evidence was given for the defence to the effect that the lights were burning within five minutes of the accident. The Sheriff said there was a conflict of evidence, but he had come to the conclusion that the lights had gone out, and he gave decree for £12 and expenses.

POLICE TRAPS.

BETWEEN Wymondham and Hethersett there is a measured distance. A QUARTER-MILE stretch on the road between Dorchester and Shillingford is used by the police for trapping motorists.

A TRIO of motorists have just been trapped on the road leading into Winchester, and care should be taken when within ten miles of King Alfred's city.

ON the Bristol road, at Northfield (Birmingham), the police are displaying quite an enthusiasm for catching motorists.

SERGEANT TUCKWELL, of the Solihull (Birmingham) police, is proving a worthy imitator of his Surrey *confreres*, and at Elmdon bagged a motoring quintette the other day.

IN connection with the meet of the Norfolk Automobile Club at Sheringham, the police laid traps on the road between Aylsham and Cromer, but they were outwitted.

MOTORISTS touring in Yorkshire are warned as to police traps all over the county, and, besides those previously given, the Yorkshire Club inform us of the following in active operation:—

Between 9th and 10th mile from Leeds, on Selby road, there are two police traps of $\frac{1}{2}$ mile and $\frac{1}{4}$ mile each on a down grade, and to stop a car which does not intend pulling up, there a police driven horse and trap is placed across the road. The police in charge have an elaborate book of times.

On the same road, between 10th and 11th mile, there is a measured $\frac{1}{4}$ mile on the down hill past the Boot and Shoe public-house.

Nearer Leeds, and between the Gaping Goose Inn and Garforth Bridge, are two more measured distances.

Also between Addingham and Bolton Abbey the whole of the distance is measured out, and the police work different sections.

There is another measured distance from Settle, viz., from the Lych Gate of Settle Church and the River Bridge.

A POLICE trap is now generally set up on Sundays on the road running into Purley from Beddington. This road is called Plough Lane, and runs from the Plough Inn, Beddington, to Purley Corner. Five policemen were stationed on the hill running down into Purley on Sunday last.

A POLICE trap was carefully laid on Sunday morning at Aylesbury, no fewer than seven policemen being requisitioned. The trap is on the main road from Tring to Aylesbury. It is on a gentle decline about 300 yards from the commencement of Aylesbury and finishes at Hazell's Printing Works, where the unwary motorist is pounced upon. The other half of the trap begins at the Vale Cricket Ground, and finishes at the same corner of Hazell's Printing Works. Other traps are being laid at other entrances to the town, so motorists had better keep well within the legal limit on entering and leaving Aylesbury.

IN the Leeds police-court, the police have explained the methods they adopt to catch motorists in the Headingley district. When a motorist is seen coming at what is considered an excessive speed, an officer at the opposite end of the measured distance drops a paper, to indicate that his end of the furlong has been reached. The officer at the other end thereupon sets his stop-watch going, and as soon as the supposed offender has passed him he stops it. Then he gives a signal to a third officer farther along the road, who stops the driver.

THERE is a police trap on the road between the top of Godstone Hill and Caterham. The police have a measured distance, and the time is taken by an officer stationed about 300 yards off the road on a hill to the left of the road, i.e., going towards Caterham.

THERE is also a trap on the Carshalton Road between Sutton and Carshalton, starting at the railway bridge on the top of the hill and finishing by the convent wall; there were several motorists caught there on Sunday. Mr. Norman A. Letts was able to warn several, and thus saved them from being stopped.

Where no alleged speed is given it is understood to be above the legal limit.

* Motor-Cycle Cases.

Pressure on our space prevents the publication of other cases reported.

At Tadcaster, on Monday, Humphrey K. Hitchcock, an engineer's apprentice, was charged with riding a motor-cycle at excessive speed and with posting bills bearing the words "Police trap" on telegraph poles. He had stuck these bills at each end of the measured distance where the police were in wait for offenders. For exceeding the legal speed the defendant was fined 50s. and costs, the fine for posting the bills being 10s. and costs.

REGINALD PANTER, chauffeur to Captain Paulett, was fined 14s. at Leamington Spa on Tuesday for driving a motor-car to the common danger through the principal thoroughfare of the town.

INCLUDED in the batch of cases heard at Woking was that of W. Parry, of 159, High Holborn, W.C., who was summoned in respect of a motor-bicycle, driven at the rate of eighteen miles an hour on May 24th. Defendant asked Sergeant Jarrett if he had ever seen him before. Witness said that to the best of his belief defendant was the person he stopped, but he would not be positive. The man pointed to a name on his machine, which he said was his own. Defendant said he was stopped by no one on the day in question. He was a motor-cycle maker, and his name appeared on many machines. The Chairman said that as the witness was not quite certain of defendant's identity the case would be dismissed. Defendant applied for his expenses and those of a witness, and was allowed 10s. Not often does a motorist obtain compensation from the police.

CLAIM FOR DAMAGES.

At the Brompton County Court (London), on Monday, before Judge Stonor and a jury, Mr. Frederick Mahlstedt, cab proprietor, Paddington, W., brought an action against Major E. H. Hills, 32, Prince's Gardens, W., claiming £49 19s. 6d. in respect of fatal injuries to a mare, said to be due to the negligent driving of a motor-car by a servant of the defendant. The defendant repudiated his liability in regard to the claim, and counter-claimed for £20 for damage to his motor-car, alleged to have been caused through the negligent driving of the plaintiff's man. The jury came to the conclusion that the driver of the motor-car was guilty of negligence by driving at an excessively rapid pace, but that the driver of the cab was also guilty of negligence which contributed to the accident. This was a verdict for the defendant on the plaintiff's claim, and for the plaintiff on the defendant's counter-claim. His Honour gave judgment accordingly, and allowed no costs on either side.

WORK FOR THE TRADE.—QUESTION AS TO "EXTRAS."

At the Brompton County Court (London), on Monday, before Judge Stonor, the Locomobile Company of Great Britain, Ltd., brought an action against Mr. William Stonebridge, motor-car and cycle repairer, etc. (trading as the Talgarth Cycle Company), The Parade, North End Road, Fulham, S.W., claiming £12 odd in respect of work done and materials supplied.

Mr. George Shave, works manager to the plaintiff company, stated that on June 20th of last year the defendant called at the plaintiff's works, and asked them to generally adjust a motor-car, adding that he wished the account not to exceed £3. Witness said he would do his best to keep the price down as mentioned. A few days later, while the work was in progress, a gentleman, who said he came from Mr. Stonebridge, called at the works, and witness pointed out to him that it would be impossible to make the car fit for use without exceeding a charge of £3. The gentleman then replied, "Very well go on with it." On July 1st the car was taken away by the same gentleman, and a fortnight later the defendant wrote asking for a detailed account. The request was complied with, and monthly accounts also were sent in, but in November the defendant wrote stating that he had not given orders for all the work to be done, nor authorised anyone to give such orders.

In cross-examination, witness denied that he was directed merely to rectify a leakage in the steam-pipe; he was told to generally adjust the mechanism of the vehicle. When the car was finished they delivered it up to the owner of the car, who, witness understood, was a representative of the defendant. Plaintiffs had since applied to the owner of the car for payment of the account, but that was done at the defendant's request.

The Judge: When was it you knew that this gentleman was the owner of the car?—Witness: When he came to fetch the car away.

When all this work was finished?—Yes, sir.

The defendant stated that he merely asked plaintiff's manager if he could stop the steam leaking from one of the pipes, clearly stating that the charges were not to exceed £3. He gave no further orders for work to be done to the car, nor authorised anyone to give additional orders. When finished, the car was delivered, not to him, but to the owner. When an account for £14 was sent in witness at once called at the plaintiff's works and protested that he had not given orders for the additional work.

In cross-examination defendant said that he had not yet sent in his account to the owner of the car, but on getting the plaintiff's account he at once forwarded that to the owner of the car.

The plaintiffs' manager, recalled, denied that he had received a complaint from the defendant regarding the amount of the charges until the present year. If defendant had called and made such a complaint to the firm witness would have been sure to have heard of it.

His Honour said he did not think he could come to a proper conclusion regarding the case without hearing what the owner of the motor-car had to say.

The case was accordingly adjourned until the 12th inst.

VIOLENT PREJUDICE.

ERNEST BECKETT, of Woodford, has been summoned for wilfully damaging the mudguards of a motor-bicycle, the property of Morton Ponder, at Wanstead. Mr. Ponder, who lives at 15, Wellesley Road, Ilford, said that on Bank Holiday he was riding a motor-bicycle between Wanstead and Ilford. He saw the defendant and three other men, and as he passed them the defendant put a stick into the spokes of the back wheel. The witness was thrown off and his mud-guard was bent. The defendant was fined 5s. and also ordered to pay the costs and damage (£1 4s. 6d.) in addition to the fine.

SCOTTISH AUTOMOBILE FACTORY.

THE new works erected by the Albion Motor-Car Company, Limited, were briefly referred to last week. They are situated in South Street, Scotstoun, West, within easy access of Glasgow, and are substantial brick buildings, excellently lighted, cool in warm weather, airy and well ventilated, brilliantly lit at night by an installation of Keith's high pressure gas system, and heated in winter by a system of low pressure steam pipes. The power is generated by a 33-b.h.p. Crossley gas engine. The works are built throughout to comply with the requirements of the insurance companies and

also the sanitary authorities. Goods are delivered into the main store, where castings, forgings, and all raw material are carefully stored, from thence the parts pass out to the machine shop, and when work has been done on them there they are forwarded to the store for finished parts, where they are carefully inspected before being taken into stock. The smiths' shop is also close at hand, delivering the forgings to the machine shop. The parts are then passed out as required to the assembling shop, which is just beyond, and are finally finished off before being handed over to the erecting shop where the cars are built up. The motors and frames when completed are then run through to the testing shop, and after being carefully adjusted are given a continuous run of about nine hours. They are taken down, closely examined, and rebuilt again, and are then ready for the practical test on the road. Adjoining the testing shop there is the shop for repairs, and beyond that a large bay for storing finished cars.

One of the features of the machine shop is the floor. This is formed with a dry bottoming of broken brick, on the top of which concrete is laid, and then a thickness of asphalt to make the whole thoroughly damp-proof. The assembling and erecting shop has a number of special machine tools for its own use. It is well fitted out with benches and has a pit for getting at the under side of the cars. It is also well supplied with overhead travelling cranes. The testing and repair shops are separated from the rest of the shop by a fire-proof wall. They are provided with a travelling crane, and the repair shop has also a pit for the inspection of cars that are being overhauled. Beyond this is the cleaning shop and the store for finished cars.

A TRAMCAR accident occurred in Bradford the other evening. Mr. George Haley was returning in a motor-car to his home at Clayton with Mrs. Haley, when he endeavoured to get in front of an electric tramcar which was proceeding in the same direction. Near Ingleby Road another car approached from the opposite direction, but seeing the motor-car the driver came to a standstill. The driver of the other tramcar, however, not being aware of Mr. Haley's presence, continued to run at a good speed. Mr. Haley endeavoured to drive between the two. The space, however, proved to be insufficient, and the motor-car was jammed between the two heavier vehicles, and completely wrecked. Mr. and Mrs. Haley had narrow escapes of being killed.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. V.]

LONDON, SATURDAY, JUNE 20, 1903.

[No. 224.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

HERE seems much truth in the statement of the Home Secretary last week that during 1902 there were 1,203 persons injured by covered vehicles in London, not including the City, and in forty-two cases the accidents proved fatal. This accounts for the new bye-law suggested by the London County Council, which might well be adopted wherever traffic is closely associated in our Metropolitan thoroughfares. Hooded vans are a delusion to their drivers, and a menace to the public safety. Legislators with a superabundance of energy might turn their attention in their direction.

To Banbury Cross.

A RUN of about twenty-two miles to Banbury has just been enjoyed by the members of the Oxford Automobile Club, the attendance including such ardent motorists as the president (Mr. C. Rippon), the hon. secretary (Mr. W. L. Creyke), Mr. N. G. Ravenor (Witney), Dr. Daly, and Dr. Collier (Oxford). Mr. Ravenor travelled on his 10-h.p. Gladiator; the president, with Mrs. Rippon and Mr. Walker, on his 8-h.p. M.M.C.; the hon. sec., with Mr. Percy Hall, on his 30-h.p. Panhard; Mr. F. G. Barton, with Mrs. Barton, Mr. Barton, jun., and Mr. J. Sherratt, on a 12-h.p. M.M.C.; and Mr. Allman and Mr. G. Strangward (Kilburn) on an 8-h.p. Renault. Dr. Daly had the misfortune to cut a tyre when about ten miles out so seriously that he was obliged, after temporary repairs, to return to Oxford. The gradient is upward nearly the whole way to Banbury, and some nasty hills had to be encountered. That at Deddington afforded a splendid test of hill-climbing power, but all the cars without exception took the stiff ascent without any apparent difficulty. On arrival at Banbury, the party put up at the White Horse Hotel. The return journey was accomplished without untoward incident, and all acknowledged having spent an exceedingly pleasant afternoon.

Tunbridge Wells.

OUTSIDE Tunbridge Wells is the Common, with splendid roads, popular among motorists and amid delightful surroundings, such as are depicted in the photograph on page 308, taken from an official guide to the town just published by the Corporation. This guide is almost as charming as Tunbridge Wells itself, with its delightful pictures of the glades and glens nestling within easy radius of the place. As a health resort the Kentish town has been famous for two centuries, and in 1902 the death rate was only 12·7. The Common is one of the beauty spots of the county, and not the uninviting, dreary area usually designated by such a name, while the roads in the district are good, and lead to historic buildings such as Bayham Abbey, Tonbridge Castle, Penshurst Place, Knowle House, Fridge Castle and other interesting places where police are tolerant and residents hospitable.

Motor-Car Imports and Exports.

THE returns relating to the British imports and exports of motor-cars and cycles during May now available show that very large numbers of foreign-built cars continue to be imported. No less than 570 cars and cycles were imported into this country last month, the value of the same being returned at £160,729. The value of the "parts thereof" is given as £23,316, so that we get a combined total of £184,045, as compared with £153,955 in April last, and £104,375 (representing 394 cars) in May, 1902. Some of the imports were only of a temporary character, being reshipped to foreign destinations. Thus last month the reshipments comprised thirty vehicles, amounting in value to £7,815, and £826 of parts, bringing down the net imports in May to £175,404, as against only £97,565 in the same month a year ago. For the first five months of the year the net imports of motor-cars, cycles, and parts stand at no less than £769,043 (representing 2,469 vehicles), or more than double those during the same period of 1902. As regards the exports of automobiles of home manufacture, the shipments during the past month amounted to 51 vehicles of a value of £15,515. Of parts the exports attained a value of £7,301, making a combined total for May of £22,816 as compared with £25,502 in April last, and £14,584 (representing thirty-two vehicles) in May, 1902. To the end of May, 270 vehicles of British manufacture had been exported this year, these together with the "parts" representing a sum of £110,525.

Track Racing in America.

THE first American automobile race meeting of the season was held at the Empire City track, New York, on the 30th ult., and was a decided success. The attendance was the largest ever seen at a meet in the vicinity of New York, while the programme of events provided an excellent afternoon's sport. Many of the visitors came in their cars, and nearly two hundred were counted upon the lawn and behind the grand stand. The chief event of the day was a race between "Barney" Oldfield in the 70-h.p. Cooper-Ford machine and C. G. Wridgway in a 40-h.p. Peerless. The conditions called for the best two out three five-mile heats, the contestants starting at opposite points of the track. In the first Wridgway took the lead and had gained about 100 yards on his rival at the end of the first mile, but during the second mile Oldfield made the better speed and soon took the lead, leading by a quarter of a mile at the finish. Time, 7 minutes 2 1-5 seconds. The second heat was again won by Oldfield in 5 minutes 31 seconds, and the second mile of this heat was done in 1 minute 1 3-5 seconds, thus beating Alexander Winton's track record of 1 minute 2 1-4 seconds. Another new record was established by Albert Champion on a four cylinder 10-h.p. Clement motor-bicycle. He covered 1 mile in 1 minute 5 seconds and 5 miles in 5 minutes 35 seconds. In the mile record trials, open to all types, the winner was O. W. Bright on a 60-h.p. Mercedes (time 1 minute 7 seconds). A. C. Bostwick on an 18-h.p. Mors being second (1 minute 12 seconds), and J. Tracy on a 35-h.p. Panhard third (1 minute 16 seconds). On the same day a race meeting was held by the Massachusetts Automobile Club on the Readville Track, Readville, Mass., in the

presence of over 10,000 people. The world's mile track record for steam cars was broken twice, which added to the interest of the meeting. F. E. Stanley, in a new racing car of the Stanley Motor Carriage Company, covered a mile in 1 minute 24.5 seconds, which is the new world's record for steam carriages, and George C. Cannon beat his own record of last year by covering a mile in 1 minute 42.5 seconds. The three-mile race for standard steam-cars was won by F. Durbin (Stanley) (time, 4 minutes 22.5 seconds); F. A. Hinchcliffe (Locomobile), being second.

Hill-Climbing Contest.

THE Hill-Climbing Contest of the Reading Automobile Club was decided on Saturday afternoon last on Peppard Hill in the pouring rain. The hill is one of the steepest in the neighbourhood, covers about 300 yards in length, and includes the following gradients:—100 feet at 1 in 40, 70 feet at 1 in 11, 70 feet at 1 in 10, 85 feet at 1 in 7, 20 feet at 1 in 6, 73 feet at 1 in 8½, 105 feet at 1 in 10, 66 feet at 1 in 14, 12 feet at 1 in 40. The distance had to be covered from a standing start, and all the competitors negotiated the hill without any difficulty. The best performances were:—Speedwell Motor and Engineering Company's 6-h.p. Gardner-Serpollet, driven by Mr. A. J. Dew, 39 secs.; Mr. E. J. Wickens' 15-h.p. F. I. A. T. driven by owner, 49 1.5 secs.; Mr. E. J. Wickens' 12-h.p. Pipe driven by Parratt, 50 4.5 secs.; Speedwell Motor Company's 10-h.p. Argyll driven by Mr. A. J. Dew, 58 3.5 secs.; Mr. W. L. Creyke's 8-h.p. Renault 1 min. 7 3.5 secs. Mr. J. Paxton Petty kindly acted as starter, and Mr. Albert E. Newton was timekeeper.

The Meet of the Scottish Automobile Club at Philliphaugh, N.B.
[Photo by] [Mr. T. M. Sleigh, Edinburgh.]

Motor-car Accidents.

HARDLY a week now passes without automobiles coming upon the scene in the legislative chamber, and last week-end's proceedings of the House of Commons closed with almost a full-dress debate on the wickedness of motorists. A day or two earlier Mr. Galloway Weir, who has a tenacity that must be wearisome to many of his fellow legislators, elicited the statement—which we do not accept as a fact—that ten persons had been fatally injured, and 204 others injured, in consequence of the automobile, during the present year in the Metropolis alone. Such an assertion should be treated with something more than the amount of salt necessary to catch the proverbial bird, for it includes motor-cycle mishaps as well as those in which motor-cars figured; and how quickly the ordinary journalist can tot up the aggregate of automobile accidents motorists already know full well.

Discussion in Parliament.

MEANWHILE the discussion in Committee of Supply during the criticism of the Local Government Board was instructive, and should serve as a warning to reckless motorists as to the treatment they will bring down upon the whole body of motorists if they do not moderate their ways, or act in a becoming fashion on the roads. Mr. Cathcart Wason believes that such motorists "claimed the right to drive the public off the roads. Harmless men, women, and children, dogs and cattle, had all got to fly for their lives at the bidding of one of these slaughtering, stinking engines of iniquity." Mr. H. Pease and others referred to the bad taste shown by some drivers, whose conduct calls for condemnation by every gentleman, and Sir Brampton Gurdon would imprison those who infringe the law.

"Save us from our Friends."

MR. G. HARWOOD suggested that motor-cars should carry speed recorders; and Mr. L. Sinclair—himself a speedy motorist—drew attention to the glaring lights which many motor-cars carried, suggesting that the new Bill should contain some regulations with regard to that point. Finally, in summing up the debate, Mr. Walter Long showed how thoroughly he realises the necessity of dealing with the subject promptly, and with a proper regard to the circumstances of the case—very materially different to those prevailing when Mr. Chaplin introduced his measure in 1896.

Discretion Wanted.

MR. LONG rightly pointed out that a speed of ten miles an hour might be more dangerous at one part of the road than thirty at another, and yet a man could not be stopped, because he was travelling within the statutory limit. In the first place, it must be made easy, as far as possible, to identify an offender. It was said that drivers who disregarded all the laws of good taste would not hesitate to conceal their numbers, or the numbers might be concealed by dust. It was possible that now and again there might be an escape from justice, either by fraudulent or accidental concealment, but he believed if the numbers were made sufficiently conspicuous it would be possible in ninety-nine cases out of a hundred to identify the offender. He did not hesitate to say that the roads in this country were not made for driving at the rate of twenty-five or thirty miles an hour, but there were highways, such as the old Roman roads, on which a driver could see for miles in front of him, and over which motoring was as safe for the general public as for the people in the car.

Mr. Montagu's Bill.

THE delay in the introduction of the Government's measure, which was suggested by the President of the Local Government Board, is said to be due to a desire on the part of the Cabinet to see how the House regards the Bill brought in by Mr. Scott Montagu. A day or two ago that gentleman obtained leave to bring in his proposals, which would remove the speed limit, and throw the entire responsibility on the owner of the car, while insisting on a provision for the licensing of drivers, and the carrying of numbers for identification. The Bill is backed by Mr. Murray, Mr. Norman, Mr. Harmsworth, Mr. Bull, and Mr. T. P. O'Connor, and has been read a first time. Probably on the reception accorded to this Bill will depend the ultimate attitude of the Government.

False Names.

THERE seems little doubt that a few motorists have lately given the police false names and addresses—a practice all right-minded men must condemn. At Berkshire Petty Sessions, at Newbury, the chairman has stated that the practice of motorists giving false names and addresses when

stopped by the police was growing, and called for stringent measures. In a case in point he ordered that a warrant should be issued for the defendant's arrest. At the conclusion of the ordinary business at the Redditch Police Court, one of the magistrates inquired why a case which stood on the charge-sheet of furious driving against a motorist could not be heard. Superintendent Hayes replied that the reason was that the police had so far been unable to serve the summons. The defendant had given a wrong address. He added that it was almost impossible to get an offending motor-driver to give a correct address. A magistrate thereupon suggested that in cases of doubt the police would be justified in detaining an offender until the correctness of the name and address had been verified.

source of strength to this energetic association. The wretched weather last week end destroyed the prospects of really successful runs, but venturesome mortals managed to keep up an appearance of good spirits.

London Traffic.

THE Royal Commission on London Traffic has been hearing Mr. G. L. Gomme, Clerk of the London County Council, on the evils arising from the continual breaking up of streets in the metropolis. Witness stated that his Council had on many occasions tried to have some limitations placed on the exercise of powers for the breaking up of streets, and that, in their opinion, the matter was one which required to

Mr. Frank Morris on his Car at the Royal Gates, Sandringham.

The Detention of Offenders.

THE question of the detention of automobilists having been freely suggested by several county magistrates we mention the matter as one that motorists should regard with something like concern. Under the Light Locomotives Act, the police have no such authority, and this the chairman of the Redditch bench rightly recognises. But the superintendent of police there has an idea that he could detain motorists under the Highways Act, and may be tempted to have a test case on that point. Already motorists are treated with scant courtesy by the police; their detention would be adding insult to ignominy, and it is to be hoped that no more false names will be given or anything done that might give the police grounds for advocating such a course.

Club News.

ELSEWHERE we record the doings of some of the principal provincial clubs, but would take this early opportunity of congratulating the Eastern Counties Automobile Club on securing the Earl of Stradbroke as its first president. His influence throughout East Anglia should prove a great

be regulated by some central authority. In conclusion, Mr. Gomme said that the traffic requirements of London had not been nearly met, and that until some method was sanctioned for increasing the revenue available for the construction of necessary new streets, and the widening of existing main thoroughfares, either by the taxation of land values or in some other way, it would be impossible to deal adequately with the problem of London locomotion.

Official Innocence.

IN replying to Mr. Weir, M.P., the Home Secretary says:—"I understand that in the inner streets of the Metropolis the police do not as a rule find difficulty in identifying drivers of motor-cars. In the less-frequented roads, however, the task is more difficult, and they consider that the assistance of some means of identification is much needed. I do not think it is desirable to explain in detail the means adopted by the police, nor, indeed, would it be possible, as their action is of necessity guided by the circumstances of each case." Fortunately for motorists, the methods of the police are fairly well known to their possible victims.

Right Royal Ireland.

AFTER all that has been said and written with regard to the extravagant ideas of Irish hotel proprietors as to the depth of the pockets of their visitors, it is gratifying to receive assurances from those in a position to know that much exaggerated nonsense has been in circulation on the point. Of course Irishmen are not philanthropists, or, at least, they do not run their business concerns on lines likely to lead to bankruptcy. Consequently they will expect payment for value received, and if such happens to be rather higher than would be the case during normal times, it must not be forgotten that one of the arguments advanced in favour of holding the race in Ireland was the money it would take to the country. Anyhow, motorists will learn some of the hospitality of Irishmen, and may expect a right royal welcome from all sections of the people.

On the Course.

LAST week we chronicled the facilities now provided for motorists attending the Lewes race meeting. Following this good example the executive of the High Gosforth Park Company have made arrangements with the Northern Counties Garage, of Newcastle-upon-Tyne, to have a man with a store of petrol, oil, and small accessories, and a set of tools, in attendance during the three days' meeting there next week. He will be located near the gates of the Club enclosure, so that he will be able to attend to the wants of either members or non-members of the Club. There are two or three race meetings at which motor-cars are not allowed, but the adoption of the new policy in the north and the south should quickly lead to a withdrawal of such a prohibition.

The New Star Works.

WHEN in Wolverhampton last week end we had the pleasure of being conducted round the new works which have recently been acquired by Mr. Lisle, in consequence of the increased demand for Star motor-vehicles. The works cover more than an acre of ground and are replete with the most modern machinery and are fully occupied, the "hands" having to work overtime. Everything is done on the premises, and the body department is, perhaps, one of the largest connected with any British firm of motor manufacturers. During the tour we were shown the whole progress of the building of a car, and judging from what was seen we have no hesitation in stating that the Star car is essentially "high-grade."

An Editorial Withdrawal.

It is reported that a newspaper editor who had taken a house on the Gordon Bennett course has relinquished it to another and does not intend to honour the country with his presence. Of course everyone cannot be expected to agree with motor racing on roads, even when such elaborate preparations are being made as is the case in Ireland, but surely the horrors of the Paris-Madrid event have not so seriously upset the editorial nerves. We wonder whether he will follow this policy to the logical conclusion, and, having withdrawn the favour of his presence from the race, dispose of his new 40-h.p. Mercedes, his Mors, and other signs of automobile attachment.

The Gordon Bennett Race.

IN less than a fortnight the Gordon Bennett race will have been run and won, and the great motor-car event of the year will be a thing of the past. Major F. Lindsay Lloyd, R.E., will be the starter, and the gentlemen who have consented to act as judges are the Duke of Ratibor, Baron de Zuylen, Mr. A. E. Shattuck, Colonel R. E. B. Crompton, C.B., Messrs. R. W. Wallace, K.C., W. W. Beaumont and W. W. D. Goff, J.P. For the various speed trials arranged in connection with the Irish fortnight large entries have been received. Nearly seventy cars and motor-cycles will take part in the Dublin com-

petitions, more than fifty in the Castlewellan trials, forty at Cork, and about fifteen in Co. Kerry. For seeing the Gordon Bennett race, the camp at Ardscoil is likely to be a popular venue, and those who wish to see the event from there should communicate at once with Mr. J. C. Percy, Dublin. As we go to press we learn that Henri Fournier will not be one of the French team for the race, his place being taken by Gabriel, whose extraordinary performance in the run to Bordeaux in the Paris-Madrid race brought him into the front rank of *chauffeurs* at a bound.

WE hear that the Daimler Motor Co., Ltd., has taken up the agency for a new Belgian-built two-cylinder petrol car.

THE first Theatrical Ladies' Motor Meet will be held on Monday next.

FULL particulars of the 1,000 miles Trials for the reliability of motor cycles will be given in the *Journal* next week.

THE Midland Automobile Club has been invited by Mr. F. A. Bolton to visit him at Oakamoor, N. Staffs, to-day (Saturday).

MESSRS. FULLER, HORSEY, SONS, AND CASSELL are holding a sale of the Gardner Gun Company's plant, which includes many modern tools.

THE police in the neighbourhood of Coventry and the Midlands generally are on the lookout for motorists, and several summonses have been issued recently.

AT a meeting of Cardiff Health Committee a deputation which had been appointed to attend the Bath and West of England Show reported favourably on the motor-vehicles there exhibited for haulage purposes.

RUMOUR hath it that the Ladies' Automobile Club has ceased to exist and that the Automobile Club of Great Britain and Ireland, which is responsible for the rent, has a three years' lease of 110, Piccadilly, W., to dispose of.

THE A.C.G.B.I. have just issued in a very convenient form a translation of the general racing rules adopted by the Automobile Club of France. The pamphlet, which is published at sixpence, also contains the conditions governing the race for the Gordon Bennett cup.

THE Standard Motor Co. is the name of a new Coventry firm which purposes building a car with a short-stroke engine. The change-speed gear will be extremely simple in operation. The main object of the company is to produce a small car that will be easy to manipulate, have an abundance of power uphill, and that will not exceed a normal speed of twenty-five miles an hour on the level.

MESSRS. J. ROTHSCHILD ET FILS, LTD., have been entrusted by Lord Linlithgow with an order for one of their "Berlin" motor bodies, but which is to have special seating accommodation. It is to be built in such a way as to form a couch so that his lordship can recline at ease in case of fatigue. In all, five persons can be comfortably seated in the interior of the car, and a small removable centre table is to be provided for the further requirements of the occupants. The body will be fitted to a 1904 type 24-h.p. Panhard chassis, with mechanically-operated inlet valves, supplied by the British Automobile Commercial Syndicate, Limited.

WALKER'S Practical Motor Record is a new notebook for the use of automobilists, and will be regarded with favour by those who tour. It is really a handbook of a goodly number of pages, ruled so that the motorist can make a note of his various journeys, the time occupied, and quantity of petrol used. There is also space for a weekly record of expenses and an annual summary. The literary matter comprises a table of speeds, determining the rate at which the car is travelling by taking the time for one mile, and some important rules for the motorist who does not wish to fall into the hands of the police. A list of hotels is not so complete as it will probably be in a second issue, but the general arrangement of the work is admirable. It is supplied in three or four different bindings, one good style being that in which a stud and flap are provided thus securing a compact book for the pocket. Messrs. John Walker and Co. are the publishers.

THE IRISH FORTNIGHT.

MR. ORDE has met the Committee of the Motor Cycle Union of Ireland to enlist the services of the members of that body in connection with the race, and particularly to arrange with the Union to supply a number of men on motor-bicycles to act as despatch riders between the control stations and the headquarters of the club at Ballyshannon. Mr. R. J. Macredy, the President of the Union, occupied the chair. Mr. Orde asked the Committee to arrange for forty-five men on ordinary cycles to act as pilots for the cars on their way through the controls. They would be wanted for the controls in Kildare, Monasterevan, and Athy, the arrangements for the other controls having been made. Twelve men would be wanted for each station, but fifteen were asked for to make assurance doubly sure. The men would carry the time from the inward control station to the outward control station, and the cars would be compelled to follow the pace set by the cyclists. Mr. Orde asked for twenty-one or more motor-cyclists to act as despatch bearers.

on the L. & N.W. Railway Company's system. Motor bicycles may be carried on the express passenger boats.

MR. ALEXANDER WINTON is using dry batteries in connection with the ignition on his racer. He would have preferred accumulators, but could not find any of American make sufficiently reliable. On this point he says, "It seems strange that American storage battery makers fail, so far at least, to produce reliable and efficient constructions which will equal the performance of European batteries, but such seems unfortunately to be the present condition of affairs."

IN Carlow the local cycle agents are taking up motor-bicycles with eagerness, urging local riders that they provide the best means of seeing the race. Mr. Mark Purser, of Carlow, is the agent for the Humber and Singer machines, and Mr. D. Norse, of Tullow, Co. Carlow, supplies the F. N. and Minerva motor-bicycles. There are about half a dozen motor-cars privately owned near Carlow. Mr. Purser has also accommodation for motor-cars, and does repair work.

Photo by

Mr. Alexander Winton and his Racer at Dublin.

[Lafayette, Dublin.]

It would be necessary, he pointed out, for the men to become familiar with the internal lines of communication between the control station at which they would be placed and the headquarters, as their duty would be to keep the head officials informed of the progress of the race. They would be unable to use the course road, unless in the event of an unexpected breakdown. Mr. Percy undertook, on the part of the Committee, to find the necessary number of cyclists and motor-cyclists, and the organisation of the matter was placed in the hands of Mr. F. J. Glynn, 11, Lower Sackville Street, Dublin.

MEMBERS of the Midland Automobile Club going by train to Holyhead will join the boat train on Monday night, the 29th inst., leaving Birmingham at 10.15 and reaching Dublin at 6.0 on Tuesday morning, the 30th inst. The cars of the members will leave Birmingham by a train to be arranged for on Saturday morning, the 27th inst., and the L. & N.W. Railway Company will be instructed to load up cars of members travelling by road or rail at Holyhead by nine o'clock at the latest on Monday morning. The charge for conveying a car from Holyhead to Dublin will be 35s. at owner's risk, and 43s. 9d. at company's risk. The cost of conveying a car by rail will be 6d. per mile

At the Alexander Electricity Works at Carlow the charging of main or ignition cells can be carried out at all times. Mr. G. M. Harris is the resident engineer, and as the works abut on a road which will form part of the course of the Gordon Bennett Cup race, they will be convenient for motorists visiting Ireland.

A WELL-KNOWN Irish M.P. informs us that many of the charges brought against the hotel proprietors are quite unfounded, and we have received news of at least three who will endeavour to be reasonable and hospitable. The Royal Arms Hotel at Tullamore is in railway communication with Kildare, Monasterevan, and Athy, and has accommodation for fifty visitors. The Imperial Hotel at Portarlinton is within three miles of the course at Ballybrittas, and the proprietor of the Stanhope Hotel at Ballinakill, which is within eight miles of Stradbally, is arranging for vehicles to take visitors to the scene of the event.

At the Slieve Donard Hotel, Newcastle, co. Down, a large marquee has been erected for the storage of cars at a charge of 5s. per night. Adjoining the hotel is a large open space where a hundred automobiles can be accommodated. They will each be covered with a large tarpaulin during the night, and for

such service a charge of half-a-crown will be made. A depot is also being arranged for the supply of petrol or motor-spirit, and electric batteries will be recharged at the hotel.

MR. NICHOLAS LALOR, writing with reference to our recent note on Lalor's Hill, says that the view from the top of this hill commands the course for nine miles, and is considered by many competent judges to be the very finest view along the whole route.

AUTOMOBILISM, in some form or other, is making its appearance on the programmes of many local race meetings in Ireland, and a five miles motor-cycle handicap will be decided at the Athy Sports on the 29th inst. On the same day the Maryborough Athletic Sports will take place, a motor-car display being among the attractions. A motor-car parade is also among the attractions at the sports at Ballsbridge, Dublin, on the 27th.

It has now been definitely settled that the Harmsworth Cup

UNDER the title of the "Coast Line Motorway," the Earl of Leitrim is organising an automobile service for the north-west of Donegal. The first service to be inaugurated will be that between Strabane Railway Station and Rosapenna, a distance of thirty-eight miles. Several good hotels are to be found on this route, notably at Letterkenny, Milford, and Portsalon. The terminus of the Motorway at Rosapenna will be amidst the picturesque scenery of the shore of Sheephaven Bay. At Strabane the service will make connections with trains from Belfast and Dublin, and with those of both the Great Northern and Donegal Railways via Londonderry, at hours which will suit the cross-Channel services with England and Scotland. Lord Leitrim is rolling, with steam rollers, the whole stretch of roads at his own expense.

IN connection with the Automobile Fortnight, Messrs. Salsbury and Sons, Limited, have arranged for a display of their goods at the show-rooms of Messrs. John Hutton and Sons, in Dawson Street, Dublin. Not only will they have a

Photo by]

The Gordon Bennett Course. Ballitore Village, six miles from Old Kilcullen.

[Lawrence, Dublin.

Motor Boat race will be started from the Royal Cork Yacht Club-house, Queenstown, and will finish at the Marina flagstaff.

THE committee of the Corinthian Club of Dublin have issued invitations to all the competitors, whom it is proposed to entertain at the Dolphin Hotel, Dublin, on the 27th inst. Acceptances have been received from all except the Germans, who may not arrive in Ireland until the 28th inst.

SOME enterprising Irishmen are reported to have chartered a large furniture van for the occasion of the Gordon Bennett race. Their intention is to fit up the interior of the van as a bed and dining room and camp in it in a field near the course. The roof will be made into a very comfortable grand stand by a few armchairs. The van will be taken down to the course a day or two before the event, and if the weather is at all fine the occupants anticipate a most enjoyable outing.

MR. WINTON has a good opinion of the Gordon Bennett course and describes the roads as far superior to anything they have in America. In fact, they compare very favourably with those of France, although not quite so wide. Messrs. Edge, Jarrott and Stocks have visited Messrs. Owen and Winton at their headquarters at the Rectory, Timolin, near Ballitore.

complete selection of their lamps, lubricators, accumulators, plugs, etc., but there will be a full range of motor clothing and other accessories for motorists.

MESSRS. GRANGER BROS., of Belfast, are steam rolling the roads in Queen's Co., towards the cost of which £400 has been sanctioned by the Automobile Club.

MR. J. W. ORDE, secretary of the Automobile Club, visited Castlewellan, County Down, recently, and, after making a minute inspection of the roads, says that he does not believe a finer hill exists in the United Kingdom for trying the hill-climbing capacities of the motor-cars than the famous Ballybannon Hill, which has been selected for these contests. This hill will also be taken in a downward way at the end of the four mile speed trials from Clough to Castlewellan. It is expected that from three to four hundred cars will journey north from Dublin to take part in or witness these trials. Colonel Chamberlain, the Inspector-General, has promised the service of 400 men of the Royal Irish Constabulary to assist in keeping the road, which will be closed for the day to all other traffic under the powers granted by the special Act of Parliament passed this session. Special excursion trains to Tullymurphy, Dundrum, and Newcastle will be run.

A PETROL MOTOR ROAD TRAIN FOR SOUTH-WEST AFRICA.

THE Neue Automobil Gesellschaft, of Berlin, exhibited at the recent Motor-Car Exhibition in the German capital a petrol motor road train they have recently completed for the transport of goods between the coast and the German colony in South-West Africa. Goods have at present to be

tern of combined honeycomb radiator and water tank, with cooling fan. From the engine the power is conveyed through a clutch and gear box in the usual way to a differential cross shaft. This is located more to the rear than usual, in order that small pinions on the ends may mesh with internally-toothed rings bolted to the hind wheels, so driving the latter. A feature of the vehicle rendered necessary by the local conditions is the provision of a winding drum, in order that when the train gets stuck in a soft place on the road, or on a hill, the motor-wagon may wind the

Fig. 1.—Plan of Chassis.

Fig. 2.—The Neue Automobil Gesellschaft's Petrol Motor Train for South-West Africa.

[Der Motor Wagen.

mainly transported by natives or by lumbering wagons drawn by oxen, both methods being, of course, exceedingly slow. The adoption of motor-wagons is, however, not altogether an easy matter, for not only is the road extremely sandy, but, in some parts, of a very hilly nature, while the scarcity of water precluded the use of steam wagons. Finally, after a careful inspection of the local conditions and of the requirements, the train illustrated in Fig. 2 was decided upon. It consists of a petrol motor-wagon with two trailers, the whole being designed to carry a load of 20 tons. Power is supplied by a 40-h.p. four-cylinder engine, having magneto ignition, and the latest pat-

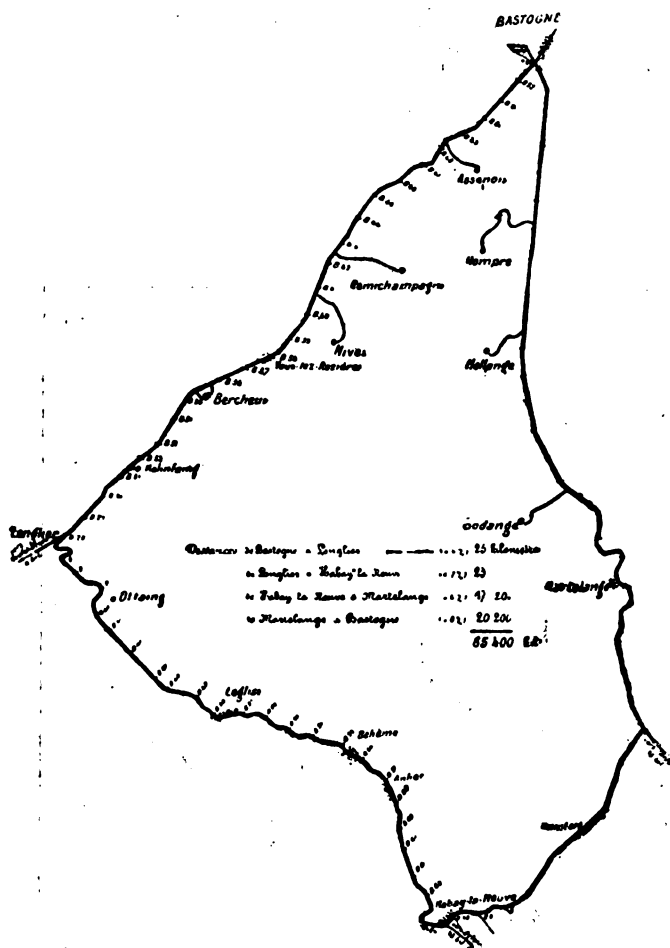

trailers forward. The winding drum is, as will be seen from Fig. 1, located to the rear of the differential shaft. The latter is provided with a clutch, by means of which the hind road wheels may be disconnected, and spur wheels driving the winding drum engaged. Furthermore, to meet the road conditions, the rear wheels are made of unusually large diameter—5ft.—and provided with grooved tyres 32 in. wide.

THE Wolverhampton Motor Cycle Club has passed a resolution condemning the tax of 15s. per annum on motor-cycles.

CONTINENTAL NOTES.

"BY AUTOMAN."

MISFORTUNES never come singly. The news of the death of Mr. Loraine Barrow, who had been making a gallant struggle for life against great odds, came to hand on Saturday evening last. The poor fellow had lain for three weeks more or less unconscious in a hospital, close to the scene of his sad accident. His high state of fever had almost prevented the doctors from finding out what his injuries were, but they were many and complicated. Loraine Barrow's residence was at Biarritz, but he spent the season in Nice, and was a well-known figure there. He was a competitor in nearly all the big automobile races, and on one occasion won the La Turbie Hill Climb in the tourists' category. He also during the same year made records for the mile and kilometre with standing start. The funeral took place on Monday at his home.

The Route of the Ardennes Race.

THE destruction of the greater part of the Daimler Motoren Gesellschaft Works at Cannstatt, near Stuttgart, in the very height of the season, took all the automobile world by surprise at the beginning of last week. It has not been possible to establish the origin of the fire; but so inflammable were the materials all around, that there was little or no chance of saving anything except the machine tools. There were at the time about seventy cars in course of construction in the great assembling hall, and all these were completely destroyed, including the 90-h.p. cars that were being prepared for the Gordon Bennett contest. It will be from three to four months before these cars can be replaced; but fortunately the company has new works in course of construction, and these will enable them to gain the lost time quicker than would have been the case had they not

had these new works in hand. The new works occupy a superficial area of 120,000 square metres, and are situated at Untertürkheim. The Government of Wurtemberg offered to put at the disposition of the Cannstatt Company locomotive works at Esslingen. It is here that the cars will be finished for the present. The losses by the fire are estimated at 2,000,000 marks, which sum is covered by insurance. About 900 workmen have been thrown out of employment by this disastrous fire, but more than half will be able to commence work again very shortly, and towards the middle of July they will all be at work again.

It has been decided by the Cannstatt Company to compete in the Gordon Bennett race, notwithstanding the loss of their racing cars. They will therefore put in the field three 60-h.p. cars, which will, it is now reported, be driven by the Baron de Caters, Mr. Foxhall Keene, and M. Jenatz; MM. Degrais and Hieronymous will be substitutes.

THE A.C.B. has reconsidered the question of the Circuit des Ardennes, and decided after all to hold the event on the 22nd and 23rd of this month, instead of leaving it over until the later date. This decision has been arrived at because the authorisation is already given to hold the race, and it is feared that a new authorisation may be refused, so that it is judged better to hold the event and take the chances. The greatest precautions, however, are to be adopted. The whole of the road is to be closed to traffic during the race. All the side roads are to be barred, and every turning is to be tarred. The competition will commence on the morning of the 22nd with the heavy car section, which will start at 3 o'clock in the morning. The race for the heavy cars will be finally closed at noon, and half an hour later the light cars will be started off. On the 23rd, at 7 o'clock in the morning, the voiturettes will start, and they must all have finished by 1 o'clock, when the motor-cycles will take their turn. All cars must be at Bastogne Station on the 21st inst., at 9 o'clock in the morning, in order to be weighed. Only three cars of any one make will be allowed.

THE "Auto" is giving a gold medal for regularity in connection with the Circuit des Ardennes. The classification will be made in the following manner:—If several firms have three cars arriving, the three which arrive will be classed by adding together the time taken by the trio. The prize will go to the firm whose cars took the least time. Should only one firm have three cars to go right through, this firm will be the winner of the classification, and so on with two or one. Cars shall be considered to be classed if they have arrived in the time fixed by the A.C.B. The "Auto's" prize will be given without distinction of nationality or category. A challenge cup is being offered by the local committee of Bastogne, and will be handed to the driver of the car that does the best time, irrespective of category. This challenge cup must be won three times to enable it to be kept. There are considerably over 100 entries for the Circuit. They include Jarrott, Mark Mayhew, Rolls, two Wolseleys, and J. Lisle; the latter will drive Mr. Cordingley's Star car. The entries in the motor-cycle section include E. H. Arnott (Werner), Van-Hooydonk (Phoenix), and two Humbers. There will, as usual, be a special train, leaving Brussels the day before the race, and returning the evening of the second day. It is most unfortunate that the force of circumstances has made it necessary for this competition to be held so close to the Gordon Bennett race, and certain it is that some of the larger makers will not be able to give the attention to it which it deserves. It is rumoured that the Mors cars will be withdrawn in view of the preparations for the Gordon Bennett Cup.

THE Aix-les-Bains week begins on the 23rd and ends on the 28th inst., and falls also across the date of the Circuit des Ardennes. The Aix week, however, is not to be in any sense a race week. It is to be a touring competition, where the price

of the car will enter as a most important factor in the comparison. There will be three days of touring, in which about 800 kilometres will be covered, through the most lovely country that can be imagined. There will then be a great automobile paper chase, with 3,000 francs' worth of prizes, and afterwards an exhibition of the cars.

THIS week was to have seen an automobile fete in Paris, in connection with the congress which is being held at the Hotel Pastoret, the home of the A.C.F. The congress, it is true, has taken place, and began on Monday last, when most interesting discussions were inaugurated on the many subjects which interest automobilists. The Club, however, is in mourning for the loss of the comrades who died at the wheel on the road from Paris to Bordeaux, and the fetes have all been put off to another and happier time.

TALKING of the Hotel Pastoret reminds me that the Club have just obtained possession of the next building, so that the already large premises will soon be extended to almost double the accommodation, making the A.C.F. one of the finest Clubs in Paris, certainly in a unique situation.

l'Automobile and La Chambre Syndicale de l'Automobile are considering various suggested tracks. Mr. Walter Lange has unearthed what appears to be a most suitable place for such a track quite close to Paris. It is situated near the well-known hill of Suresnes, behind the Hippodrome at St. Cloud, and is said to be well-adapted for making a track over 10 kilometres long.

LA SOCIETA ITALIANA DI MOTORI DAIMLER is the name of a company which has been formed in Milan, Italy, "to manufacture and trade in automobile motors and machines using such motors." Signor Felice Grondona is president, and the board of directors includes Herr Gustav Fischer and Herr Max Duttendorfer, of the Cannstatt Co.

A PUBLIC service of petrol motor-cars has just been started between Constance and Reichenau, Switzerland. The vehicles used are of 25-h.p., and were built by Messrs. Kaufmann and Company, of Tagerweilen; they have accommodation for twenty persons.

THE Vereinigte Benzinfabriken of Bremen inform us that depots have been established throughout Germany where their petrol and lubricating oil, known respectively by the names of "Stellin" and "Luftrin," may be obtained.

A View of the Smouldering Ruins of the Daimler Works.

THE FIRE AT CANNSTATT.

A Group of Officials of the Company. Herr Jellneck in the Centre.

At a council of French Ministers on Saturday M. Loubet signed a decree appointing a commission to inquire into the questions affecting motor-car traffic.

M. LEON BOLLEE, the designer of the Bollee voiturette, familiar to all motorists three or four years ago, has just completed a new four-cylinder car on modern lines—mechanical inlet valves, honeycomb radiators, etc. A report is current to the effect that Messrs. De Dion-Bouton and Co. will take up the construction of the new car in quantities.

A HILL-CLIMBING competition was held on Sunday last over a 15 kilometre course between Pontassieve and Consuma, near Florence, Italy. The winner of the heavy car class was Signor Florio on a 70-h.p. Panhard (time 16m. 29sec.); Signor Spinelli, on a 16-h.p. Darracq was the first in the light car class (23m. 57sec.). The winner of the voiturette class was Signor Nagliati on a 9-h.p. De Dion.

THE question of motor racing tracks is just now the topic of the hour in Paris. La Chambre Syndicale du Cycle et de

THE French Automobile Club will hold a trial of motor cabs and delivery vans in October next.

THE Turin section of the Italian Automobile Club is organising an international hill-climbing competition from Susa up Mont Cenis, a distance of 23 kilometres, for July 5th.

THE value of the exports of automobiles and parts from the United States during April last amounted to £26,936, as compared with £30,239 in April, 1902. The value for the first four months of the year is given as £178,904, as against £133,746 during the same period of last year.

CAPTAIN KENLON, of the Manhattan fire brigade, has recently suggested that municipalities in giving concessions to electric tramway and lighting companies should stipulate in the contract that leads should be run from their circuits to every fire plug on the route. Electric fire engines could then be adopted, the pumps of which could be operated by merely slipping a spring jack into contact with the leads, terminating in some portion of the fire plug, while the traction could be obtained by means of a storage battery, just as with electric motor-cars.

SOME USEFUL NOTES.

THERE are a large number of people, both automobilists and prospective automobilists, who have rather hazy ideas as regards the wear and tear of the various parts of a motor-car, so a few words on this subject will perhaps not be out of place. Let us commence with pneumatic tyres. If a set of good tyres are treated well they should last a good two years and a half of average running. By "treating well" we mean not using brakes violently, so as to skid the wheels, and not turning sharp corners at a high speed. The tread should also be watched for cuts, and as soon as there are more than a few, fill them up, so that the wet cannot penetrate and loosen the tread completely. Some people advocate the system of equal wheels, and changing the covers over, but this is a somewhat questionable advantage, as, if a tyre is worn at all badly, and is placed on the front wheel and bursts, a nasty smash may result, since a burst tyre on the front wheel is considerably worse than a burst tyre on the back wheel.

WE next pass on to bearings. The ordinary gun-metal bearings used throughout the gear-box and engine of a car should wear well for ten to twelve months; after that time they should be examined to see how much wear has set in. In the Panhard type of motor-car, the brass that is used for withdrawing the clutch often wears somewhat quickly; it usually requires looking to in three or four months. Ball bearings are practically everlasting; if a ball bearing is going to give out, it will do so almost at once; if not, and it is a good ball bearing, it will never give any trouble at all.

THE life of a chain on a motor-car is a question that depends entirely upon the way the chain is attended to. If two sets are kept, so that there is always a set at hand to replace the running set which have got wet and clogged, and have to be properly cleaned, a pair of chains should then run some 20,000 miles, which represents about a year and a half or more of average running. The change-speed gear of a car in careful hands should easily last three years; and there are many cars running to-day with the same gears they had in between five and six years ago. There are other parts of a car which are liable to wear and tear, *e.g.* steering connections, joints, speed-lever, and striking-lever connections, but the wear in these parts is comparatively slight, and in all good designs easily adjustable.

A FRENCH company, known as L'Auto-Stand, of 20, Rue Duret, Paris, has recently brought out the little tool illustrated herewith to facilitate the taking out of exhaust valves. This task, in the case of engines of from 6-h.p. upwards, with their relatively strong exhaust valve springs, is often no light one, and

frequently results in damaged fingers. The new device consists of a lever arrangement made in two parts so as to take up little room when not in use. When placed in position, the exhaust valve spring can be held up by one hand, leaving the other free to take out the key which holds the spring in position. The tool is so arranged that it cannot slip when in use.

COOLING PETROL MOTORS BY MEANS OF OIL.

IN a recent issue we referred to the fact that an American concern was using oil for the cooling of petrol motors. As the freezing of the water in the jackets of motor-car engines is a frequent cause of cracked cylinders in the winter season, any new system that can get over the difficulty is worth enquiring into, so we at once got into communication with the firm—the Hart Parr Company, of Charles City, Iowa—who inform us that they have used oil cooling on engines up to 40-h.p. for the past five years "without a question ever having been raised by any of our customers as to its efficiency." The Hart Parr Company are makers of light petrol traction engines and horizontal and vertical petrol motors, the latter being of the inverted type, *i.e.*, the explosion chamber at the bottom and the crank shaft at the top. The jacket of the engine is in direct communication on top and below with a radiating tank in the form of an upright tubular boiler, a large number of tubes D D D passing up through it. The oil is caused to flow by a centrifugal pump from the upper

or crank shaft end of the jacket through the pipe F to the top of the tank, which it enters at G, and returns to the jacket through the lower connection pipe. The exhaust from the engine is led through the pipe A into the dome above the oil tank and is discharged through the nozzle B into a stack surmounting the tank. The suction created by the upward discharge of the exhaust into the stack causes a strong upward draught of air through the tubes D D D, thus facilitating the radiation of heat. This arrangement also aids in silencing the noise of the exhaust. The radiator is sealed air tight, and as there is no waste or diminution of the oil the original supply furnished with the engine should last as long as the engine itself. The cylinder is kept sufficiently cool for the successful operation of the engine under all conditions of weather, when worked under full load continuously for any number of consecutive hours. The main advantage of using oil for the purpose of cylinder cooling is, of course, that it will not freeze in cold weather, and it would be interesting to have some experiments carried out with it on a modern motor-car, especially as to whether it would be practicable to direct the exhaust upwards.

HERE AND THERE.

A SERVICE of motor-cabs is about to be started in Munich.

SIR CONAN DOYLE has been elected a member of the A.C.G.B.I.

THE Swiss Automobile Club has now 439 members, who, among them, own 550 cars.

ARRANGEMENTS are in hand for the holding of a motor-car race between St. Petersburg and Moscow.

PUBLIC services of motor-cars have just been started between Cadiz and Algeciras, and between Navarra and Puente La Reina, Spain.

WHEN next he goes to sea Lord Charles Beresford will take a motor-car so that he may take land trips at places where the fleet may call.

MR. J. DUNCAN ROBERTS, of the firm of Messrs. Cox and Roberts, engineers, Nagercoil, has imported the first motor car into Travancore, India.

MESSRS. RUBERY AND COMPANY, of Darlaston, South Staffordshire, have got their hydraulic press at work in the manufacture of automobile frames.

HERB E. ENGLER, the president of the Frankfort-am-Main Automobile Club, is about to make a tour through Italy and the South of France on his 24-h.p. Darracq car.

MR. R. E. PHILLIPS, who is looking after the time-keeping arrangements in the Gordon Bennett race, will be glad of the help of volunteers to assist the timekeepers at the various controls.

MESSRS. MANN, EGERTON AND COMPANY, of Norwich, had a very large attendance at their recent auction sale, and Messrs. Spelman sold a goodly number of motor-cars, and motor-bicycles.

THE London Autocar Company, Limited, send a new catalogue of their motor-car and motor-cycle accessories. Within its forty pages are enumerated practically everything required by the up-to-date motorist.

FROM the Mobile Motor and Engineering Company, Ltd., Birmingham, comes a very complete catalogue of motor and motor-car accessories. It gives illustrations and brief particulars of the Waddington motor-cycles and cars, in addition to lamps, horns, tyres, pumps, etc. A couple of pages are devoted to useful hints to motorists.

MESSRS. R. REYNOLD JACKSON AND COMPANY have sent us an illustrated leaflet of the "Jackson Popular" car they have lately introduced. It is a neat little vehicle of French construction, with 6-h.p. De Dion engine and three speeds forward and reverse; the transmission being by a cardan shaft and bevel gear to the rear live axle.

IN the House of Commons, last week, Mr Akers-Douglas, replying to Mr. Weir, said that 191 motor-car accidents had occurred in the metropolis during the present year, resulting in the death of ten persons and in injury to 204 persons. Of these numbers one person driving in a motor-car was killed and thirty-seven so driving were injured.

AT the last meeting of the Scarborough Rural Council, Sir Everard Cayley moved that the County Council be asked to put up notice boards at all dangerous places in the district, warning motor-car drivers of their risk, and that the Rural Council put up similar notice boards on roads within their jurisdiction. Mr. Foster seconded, and the resolution was carried.

THE Farman Automobile Company, Limited, under new management, with Mr. A. Pereno as managing director, are making rapid strides. They have opened a garage at Skindle's Hotel, Maidenhead, in which is a complete repair shop, and all accessories can be purchased there. They are also letting out cars for hire. Other garages will be opened in different holiday centres by the company as the season advances.

THE Tourist Information Bureau of Dublin is doing much to help motorists to secure hotel accommodation during the Irish Automobile Fortnight.

THE proprietor of a motor-omnibus at Bournemouth has been fined 10s. including costs for having allowed a motor-omnibus on a public stand for a longer period than ten minutes.

A motor omnibus company is about to be formed in Cape Town, and the prospectus is being eagerly awaited. Its outlook is regarded as a very good one in view of the favour with which automobiles have been received.

AT a meeting of the Poona Cantonment Committee, it has been resolved to regulate the speed of motor-cars and motor-cycles in that city. Nine miles per hour was laid down as the maximum speed for automobiles.

MR. P. O'SULLIVAN, of Great George's St., Cork, is making a special feature of motor-car cushions in Rezone leather, which is claimed to be less easily damageable than leather, while having the merit of greater durability.

ACCOMPANYING the latest catalogue issued by Messrs. Joseph Lucas, Limited, comes a useful booklet on Motor Lubrication, containing many practical hints as well as some information concerning the Wells-Lucas motoils. A copy will be sent free on application by motorists.

The 14-h.p. Brooke Car, with Pump Circulation in place of the usually-fitted Estcourt Coolers.

PROFESSOR HUBERT VAN HERKOMER, the well-known artist, has acquired from the British Automobile Commercial Syndicate, Limited, a 10-h.p. Panhard car, upon which he intends to tour in Germany. The car is fitted with a Clement-Rothschild body, over which is a canopy giving the vehicle a very fine appearance.

THE Chessington Parish Council has drawn attention to the excessive brilliance of the acetylene lamps carried by motor-cars at night. It is asserted that they constitute a real danger from the effect upon the eyes of both human beings and horses caused by the intense darkness which follows when the lights have passed.

MESSRS. HUMBER, LIMITED, are about to put a popular-priced two-seated car on the market. The vertical engine is of 5-h.p. and is located under a bonnet in the fore part of a tubular frame. Two speeds forward and a reverse motion are provided, the power being transmitted to the rear live axle through a cardan shaft and bevel gearing.

THE Kent Automobile Club will have its first run to-day (Saturday). Members will meet at Charing, where tea will be taken at 4 p.m. The club is meeting with splendid support throughout the county, and the number of members is rapidly approaching one hundred. Gentlemen wishing to join the club should communicate with the hon. secretary at the headquarters, Star Hotel, Maidstone.

PROF. HELE-SHAW, of Liverpool, has lately become the possessor of a 24-h.p. Darracq car.

THE Darlington, Durham and North Riding Chamber of Agriculture has declared in favour of the numbering of motor-cars.

Photo by]

Tunbridge Wells Common. (See page 297.)

[Photocrom Co.

AN automobile club has been organised in Mexico City. Sr. Jose Ives Iimantour, the Mexican Minister of Finance, is the honorary president of the Club.

LISTS of automobile casualties are now appearing in the daily journals in which mishaps to motor-cycles on the track are set forth as though they were ordinary accidents on the road.

THE Tramways Committee of the Leeds City Council have decided to purchase a motor derrick for the use of the men engaged in repairing the overhead wires. A motor-car will be adopted in the first instance, and the purposes of a derrick will be served by the construction of a raised platform upon it.

LIEUT. W. P. WINDHAM, one of the King's messengers, has sent a copy of a useful little book he has just completed, entitled "Wrinkles on the Management of the Darracq Cars." In the preface the author explains that his remarks are wrinkles, and not rules, with regard to the management of Darracq cars which have been gained from actual experience. They are chiefly directed to the vehicles with 6½-h.p. and 9-h.p. single-cylinder engine, although they apply equally well to the others, including the new 8-h.p. single cylinder and 9-h.p. and 12-h.p. double-cylinder cars, the differences between the patterns of 1901, 1902, and 1903 being briefly explained. The wrinkles are comprised within 51 indexed paragraphs, which, while of particular interest to owners of Darracq cars, contain many hints which will be found useful by motorists generally. The booklet can be obtained from Barnes' Motor Depot, Battersea Rise, London, S.W.

THE Roots Oil Motor and Motor-car, Limited, having acquired larger premises at Chicheley Street, York Road, Westminster Bridge Road, S.E., are about to open them as show rooms for the sale of their own types and as a repair shop and garage for all types. The premises have accommodation for about 100 vehicles.

PROFESSOR W. H. PICKERING, the astronomer of Harvard University, who has been investigating problems in aeronautics, is now at work upon the construction of a new airship. He has placed an order with the Duryea Power Company for a 30-h.p. six-cylinder engine, which, ready to run in all respects save water, fuel, and tanks to contain them, weighs only 200 lbs.

LORD ESHER employs a motor-car in his trips from Orchard Lea, near Ascot, to Windsor, where he is Inspector of the Castle.

THE other day, at the depot in Westminster of the Petrol Motor Power Company, we had an opportunity of inspecting the first of a new type of petrol car they are putting on the English market. They are to be known as the Martini, being built in Belgium to the designs of the well-known M. C. Jenatzy. There are a number of special features in the cars, prominent among which are the magnetic clutch and the ignition, to which we hope to refer in a subsequent issue. In the meantime we may mention that the car we examined was of 24-h.p., being fitted with a four-cylinder motor, with mechanically operated inlet valves, four speeds, and chainless transmission. A 12-h.p. two-cylinder car on similar lines is expected over in a few days.

MEMBERS of the Pocklington (Yorkshire) and District Agricultural Club have passed a resolution protesting against the abolition of the speed limit for motor-cars. A similar suggestion was made at the last meeting of the Warwickshire Chamber of Agriculture, but Mr. F. E. Muntz pointed out the impossibility of farmers attempting to limit the speed of motor-cars to twelve miles an hour in the open country.

NEAR the Marble Arch, in Oxford Street, is Automobilia, a fine showroom for motor vehicles, some idea of the interior appearance of which can be gleaned from the accompanying illustration. Automobilia, of which Mr. Fordyce is the managing director, is something more than a depot for the sale of all types of cars, for here vehicles can be hired for after-

A West End "Garage."

noon runs or daily trips, a large staff of English and French drivers being always available. Here, too, accumulators can be re-charged and petrol and spare parts obtained, while repair work is also undertaken, a pit and a washing department being part of the equipment. On the occasion when our photograph was taken the showrooms were less well filled than usual, but there was a good show of Panhard, Darracq, Renault and other cars.

MOTOR-CYCLING NEWS.

HEREWITH we give an illustration of the patent switch for motor-cycles, lately introduced by Messrs. Mason and Brown, of Leicester. Hitherto the general method has been to have a switch enclosed in the handle-bar tube, the contact being made

by turning one of the handles, an arrangement which is not without its drawbacks. The new switch consists of a nickel-plated brass case, rigidly secured to the handle bar by means of a rounded plate and screws, forming the earth connection to the frame. The other connection to the wire is made by means of a nut on the outside of the case, and a pin carried through to the inside, being insulated by an ebonite bush from the remainder of the case. The contact is made by an incomplete circle of strong German silver inside the case, which is moved backwards and forwards by means of the handle as shown in the illustration. When the handle is at position marked "On" the circuit is completed by means of the spring and the inner end of the terminal receiving wire; when at "Off" the contact is definitely broken. When the machine is not in use the handle shown separately at the bottom of the illustration can be removed, thus obviating the risk of the battery being run down, and also obviating the necessity of a separate interrupter plug. The handle can only be withdrawn when it is in the "Off" position. The top cap is removable for examination purposes, while we may add that the switch is practically watertight, thus preventing short circuiting through wet getting in.

MOTOR-CYCLISTS who use trailers in connection with their motor-bicycles cannot be too careful in seeing that the connection between the two is securely made. We mention this as a Manchester lady met with a nasty accident last week near Northwich. Her husband was riding a motor-bicycle, which became detached from the trailer in which she was seated, the lady being thrown out and badly bruised.

THE New Hudson Cycle Company, Limited, of Birmingham, have sent us a copy of a little handbook they have just issued; it gives particulars of the new Hudson motor-bicycles, while about fifty pages are devoted to descriptions of the various parts of the machine, and to a number of hints which will be found useful to those who have lately joined the ranks of motor-cyclists.

TO-DAY (Saturday), the Nottingham Motor Cycle Club will hold a run to Burton-on-Trent, where the members of the Birmingham Motor Cycle Club will be met. Church Stretton is the destination of to-day's run of the Wolverhampton Motor Cycle Club.

MOTOR-CYCLISTS must be careful with regard to the renewal of licenses. Recently we reported the activity of the authorities at Bristol. Now we learn that the first prosecution by the Inland Revenue authorities for keeping a motor-cycle without a licence has just been heard at Coventry, when a well-known local resident was fined 10s. and costs. The defence was that a licence was taken out last November, and defendant thought it would cover twelve months from that date. Another case has also occurred at Oldham, where a plea of ignorance of the law secured a reduction of the penalty to a shilling.

MESSRS. JAS. DAWSON AND SONS, the makers of the Lincoln

belt, ask us to mention that castor oil is very detrimental to the long life of these belts. Castor oil has the effect of dissolving the cement which holds together the layers and joints of the leather, with the result that the belts soon come to pieces. Lincoln belts are sent out ready for use, and a special dressing for application is supplied by the firm at a small cost.

COMPLAINTS are being made as to the excessive tolls for motor-bicycles in some parts of North Wales. At the gate on the causeway between Portmadoc and Penrhyndeudraeth a motor-cyclist was charged ninepence for himself and machine, while at Pont Briwofod, on the way to Harlech, sixpence was levied.

AN important meeting of the General Committee of the National Cyclists' Union was held on Saturday last, when a long discussion took place on the question of motor pacing in open amateur events. Eventually the committee decided that no further permits should be granted at present, whilst permits already granted for forthcoming events should be cancelled. Motor pacing will be allowed in club events, as hitherto, subject to conditions to be drawn up by the sub-committee appointed for that purpose.

THE Motor Cycling Club will shortly hold a series of fifty miles non-stop trials, open to members only, for medals, which are being presented by a member who wishes to remain anonymous.

THE Singer Cycle Company, Limited, has just finished the first of a new type of 3-h.p. chain-driven motor-bicycle. Mr. Perks recently tried its hill-climbing capacities on Edge Hill, and accomplished the ascent at a good speed without pedalling.

THE motor-cycle is beginning to be seen in Australia. There are now three or four in Geelong, Ballarat, and Bendigo, and in the smaller towns the old cycle depots are changing their signs from "Cycle Repairs" to "Cycle and Motor Works." All this heralds, remarks the "Australian Cyclist," the advance of the new industry.

A NEW belt fastener, designed to fit any motor-cycle driving belt, has lately been put on the market by Mr. A. H. B. Sharp, of Lincoln. As will be seen from the accompanying illustration, which

shows the actual size of the fasteners, it takes the form of a couple of hooks, which are pivoted in one end of the belt, and which engage in contrary directions with a pin applied in the other end of the belt.

AT Brighton two motor-omnibuses have just been licensed.

AN electric fire service wagon has just been added to the equipment of the fire brigade of St. Gilles, Brussels. It carries eight firemen, and the necessary hose reels, scaling ladders, etc.

FROM the Cleveland Automobile Club (U.S.A.) comes a neatly got-up prospectus, giving the rules and objects of the club. The last two pages are devoted to some remarks on the regulations which exist in Cleveland with regard to automobile traffic, the Club offering its support in seeing that the regulations are adhered to. Accompanying the prospectus is a list of motor-car owners in Cleveland, whose total is now close on 700.

CORRESPONDENCE.

THE MANNERS OF HORSE DRIVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There can be no question that the motor-car is rendering good public service in exposing the carelessness of drivers of horses. It has been repeatedly shown that a large proportion of the accidents ascribed to motor-cars are due to the stupidity of drivers who habitually drive with loose reins, so that quick control of their horses is impossible, or are themselves more frightened than their horses at the appearance of an automobile. The majority of runaway horse incidents and accidents are undoubtedly caused by this same lack of attention to their business on the part of those entrusted with the driving of horses, for if a frightened horse is properly checked and pacified before he is terror-stricken and unmanageable, his running away can be averted. It is generally conceded that motor-cars have a right to the public highways, and that the motorist is bound by the same rules of the road as govern the driver of animals, the unwritten law of courtesy further requiring that he should exercise all reasonable caution to avoid accidents due to the frightening of horses. An equal responsibility, however, rests upon all owners of horses which are driven through the streets to take all reasonable precautions to avert accident through the horses taking fright at motor-vehicles. The driver of a horse—the horse's owner is, I take it, responsible for the driver—is assuming a moral and legal responsibility when he brings an animal upon the highway, where all have equal rights with himself, and the time has arrived when this responsibility must be recognised and drivers held accountable for the animals they guide. Justice demands that drivers of horses be treated in the same manner as motorists. Uncontrollable animals should not be allowed on the roads, and for accidents that are ascribable to carelessness somebody should be made to pay.—Yours truly,

PROGRESSION.

THE STEERING OF MOTOR CARS AND GYROSCOPIC ACTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—When travelling on a high-power motor-car, if the driver incautiously take a bend of the road at too great a speed the car is overturned, or the wheels collapse under the tremendous strain, or (in the case of a racing car having a low centre of gravity) the car is forced violently outwards against any obstacle, in spite of the efforts of the driver to keep an inside course, the result being a bad smash, as in the recent fatal accident to Count Zborowski. In that lamentable occurrence there were all the conditions necessary to produce powerful gyroscopic action.

In view of that accident and many similar ones, the drivers of new or untried cars should be particularly careful in the forthcoming Gordon Bennett race, because there are some ugly corners on the course; consequently, competitors who mean business will have to run great risk, owing to the fact that the excessive side strain cannot be calculated or controlled by the steering wheel.

What I wish to call particular attention to is that these lamentable occurrences are generally supposed to be caused by the centrifugal force which is created by taking the curve at too high a speed. I admit that to a great extent this is so; but the following experiment will prove that the gyroscopic action set up in the road wheels and in the engine flywheels must seriously affect the steering of fast cars.

Take a spare wheel, preferably a light motor-car wheel, and having grasped the axle firmly with both hands, get a friend to spin the wheel as rapidly as possible by striking the spokes; or, should an engine be available, place the tyre against the flywheel, and when the motor-car wheel is revolving at a high speed it will be noticed, firstly, that the wheel can be moved easily in a straight line, as if fixed to a motor-car travelling on a straight course; secondly, bodily translation of the axis parallel to itself produces no gyroscopic effect, but any other movement is powerfully resisted (other than in its plane of revolution). This resistance increases in proportion to the speed, diameter of wheels, rate of revolution, and sharpness of curvature. The numerical value of these gyroscopic effects under such varying conditions could only be ascertained by experiment; and even then allowance would have to be made for centrifugal force and non-synchronous action of the engine, which sometimes occurs at certain critical speeds. I mentioned this matter to an engineer who is credited with being an expert in mathematical analysis, and his remarks showed how little this subject is understood. He said: "In the case of a motor vehicle turning a corner, the steering wheels have already been diverted from their original plane of motion before this gyroscopic action takes place." Let me point out that it is the very act of diverting the wheels from the original plane of motion which produces the action to which I refer.

In turning a corner, the gyratory action generated in the four road wheels and in the flywheel of the engine has to be counteracted, thus putting a strain upon the road wheels and steering gear, quite separate and distinct from, and additional to, those effects caused by centrifugal force.

One remarkable peculiarity of this gyroscopic action is that it has no tendency to upset the car, as is the case when centrifugal force comes into action from excessive speed round a sharp curve, or from bad steering. On the other hand, it tends to keep the car, as one might say, straight on the road. An express train travelling at a high speed has the same tendency to continue running in a straight line; but it has this advantage over a

motor steered by hand, that it is compelled to follow any curve because it is guided by the rails; but even with this additional security engineers know there is danger of derailing, and generally slow down when nearing a curve.

The flywheel of a petrol motor being usually heavier than the road wheels, and the speed very great, this gyratory force is much more evident in the flywheel and other revolving parts of the engine than it is in the road wheels. It is the position of the engine on the car to which I attribute this gyratory disturbing effect upon the steering. Speaking purely from a racing point of view, I would suggest that the engine be placed (for experiment) in the centre of the car, where there is the least turning movement, with the cylinder fixed horizontally, and the shaft vertically, which would allow the car to turn in any direction without altering the plane of revolution in the flywheel. The diameter of the road wheels is an important matter, because increasing the diameter of the wheels unnecessarily exaggerates the defects which I have pointed out. I admit that any radical alteration in the position of the engine, etc., presents serious difficulty; but I am of opinion that some alteration is urgently needed to insure the safety of fast cars. Any structural alterations which will reduce this tendency would at the same time greatly increase the durability of motor-cars, especially in regard to tyres.—Yours truly,

PERCY PITMAN.

MOTOR-CAR RACING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Permit us to support the views put forward by Messrs. James Rickard and Co. concerning motor-car racing. Whilst it has certainly helped us in our earlier stages of development, it has now by far overshadowed its usefulness, and is rather a menace to and an incubus upon the industry than otherwise. Reliability trials are of infinitely more practical value, where a close and accurate record of everything done and happening to a car is made and published, than races in which speed is the one and only ultimate end. Take the Paris-Madrid affair. What have we learned from it save that half the cars which started collapsed, or, at any rate, found it necessary to retire before reaching Bordeaux? With the exception of the most notable cases, where accidents resulted in fatalities, we have learned nothing concerning these breakdowns. Accidents of this character teach us nothing in construction. One writer says he passed forty wrecks on the way back. What happened to them? Did they all collide or run off the road? Doubtless the makers know, but whatever lesson they may learn individually from the failure of their cars, it is fairly certain that they will keep it to themselves, and all the inquiring public seeking knowledge can conclude is that if 40 per cent. to 50 per cent. of cars built specially for the purpose fail to complete a 300-mile journey, can they expect better results in the touring cars made by the firms in question? The development of speed, too, is no longer desirable. We have long passed both the practical and the safe limits, and racing, in which the car that gets there first—in other words, the fastest car—wins must develop the speed features of cars to the exclusion of all else. So far as the industry is concerned, it would be none the worse, but rather the reverse, if the construction of speed cars were prohibited altogether, for racing is an enormous tax upon the industry—the value of the derelicts strewn along the road to Bordeaux was estimated at £70,000—and few if any makers profit by it; whilst if the trade generally are compelled, in order to keep up with the procession, to take part in these orgies, the buyer of the touring vehicle will have to foot the bill in the end.—Yours truly,

THE DURYEA MOTOR CARRIAGE COMPANY.

COST OF UPKEEP.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I send you costs of upkeep of my two-cylinder 6-h.p. Daimler car since I commenced running it in the spring of 1899:—Year 1899, total costs, £3 5s. 8d.; year 1900, total costs, £53 3s. 10d.; year 1901, total costs, £49 15s. 8d.; year 1902, total costs, £9 0s. 10d.; year 1903, total costs, £31 18s. 6d.

These figures are taken from my business books, and are inclusive of everything I have paid for the upkeep of my car, but exclusive of oils and any trifling payments for a temporary repair when touring. These small payments, however, have not exceeded a few shillings at a time, and certainly £1 per annum would more than cover them.

The 1899 account was made up of: (1) costs of repairs through being twice run into by horse-drawn vehicles, and (2) general overhauls on three separate occasions during the summer and autumn. As I had no engineering knowledge, and was not familiar with my car, I thought it better to send it to the motor works periodically to have it examined. The 1900 account comprises: (1) £11 17s. 6d. for overhaul at beginning of year and for new cylinder head; I allowed frost to crack the cylinder-head, not being aware that there was danger from frost and that I should have run the water off; (2) £6 10s. for new gear wheels; (3) £6 6s. repainting and japanning; (4) £5 7s. 6d. overhauling gear; and (5) £11 13s. 6d. new tyres for hind wheels. The 1901 account comprises: (1) £4 16s. 6d., repairs necessitated through my having overturned and damaged car; (2) £4 10s. new water-tank; (3) £5 18s. overhauling and two new gear wheels; (4) £15 10s., Clarkson patent radiator (there was no radiator on my car when I purchased it); (5) £8 12s., valves, ignition tubes, burners, springs, and parts purchased in order to have everything in good condition for the

Glasgow Exhibition 535 miles trial runs, in which I took part. The 1902 account comprises: (1) £2 17s., repairs to radiator and pump, etc.; and (2) £5 6s. 6d., ignition tubes and parts. The 1903 account comprises: (1) £13 9s. 8d., thorough overhauling of engine and gearing and all parts, and having compression plates put on; (2) £5, repainting and varnishing; (3) £2 for parts, mostly necessitated through damage to car by fire. The engineer who has just overhauled my car informs me that the engine and whole gearing are in as good condition as the day I purchased the car, so that I do not anticipate any serious outlay for further repairs this season.

Only a novice would incur the accounts I did in 1900 and 1901. I give you my actual experiences and costs, leaving your readers to discount from these or do otherwise as they prefer. I have had to buy my experience, but I do not regret it. I have not kept an account of the mileage I have run, nor what it has cost me for petrol and lubricants during these five years. My books, however, show accounts for £35 paid for petrol, and fully £10 for lubricants, but as I occasionally purchased oil while on the road this does not represent my total costs for oil. To give a wide margin, however, I think it may be fairly taken to represent a mileage somewhere between 20,000 and 30,000. As I do not keep a man, and attend to the washing and cleaning of the car myself, the only other expenses I have are the carriage licence and insurance. With the experience I have now had, I hope in future to attend to all minor repairs myself and to keep my annual repairs bill at a considerably less average than £27 16s. 11d., the average of my first five years' running. Hitherto I have sent my car to the motor works for every little repair.

In the foregoing figures it will, of course, be observed that I include items which might fairly be stated as capital expenditure and not as repairs. For example, the radiator is clearly a capital outlay, but I am simply stating the actual outlays in which the possession of a motor-car has involved me during the past five years.—Yours truly,

JAMES BURNS.

THE PETROL-ELECTRIC CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was very pleased to see a letter in your last issue on the subject of electric transmission, and I should be still better pleased to see the question thoroughly gone into and discussed, as it seems to me that electric transmission is exactly what is required to bring the petrol car to (if I may use the word) perfection.

The Lohner-Porsche system is open to several objections—at least, I have heard so from several people. Your correspondent "G. B. P." states that they are difficult to start on a steep hill, and I can certainly bear him out in this statement, as I remember seeing one some time back at Biarritz in difficulties on a hill—it was driven, I fancy, by the late Mr. Loraine Barrow. How does the Fischer system answer? We do not seem to hear much about it.—Yours faithfully,

FLASH.

NOVICE writes:—"Can any of your readers explain the reason I cannot get the engine on my Baby Peugeot car to start? If I open the compression tap it will spark first-rate, but when I close it it will not explode at all. If I half close the tap it explodes two or three times and then stops. The accumulators are fully charged, the compression is very strong. I have had the carburettor and mixing chamber off and they appear to be in proper working order."

H. J. K. T. writes recommending Plaxine as an effectual and satisfactory cure for slipping brakes. It leaves the parts clean, and makes them grip at once. A friend tells him that he keeps his brakes always dressed with a few drops of Plaxine, and never has the slightest trouble with them.

CLUB NEWS.

LINCOLNSHIRE.

THE Lincolnshire Automobile Club had a successful meet at Market Deeping, midway between Spalding and Peterborough, on Saturday afternoon. The day was dull and showery, and some of the motorists who had come from a distance reported that they had encountered heavy rain. The roads, however, were good, and excellent runs were enjoyed. The Club were entertained by Mr. and Mrs. Geo. Linnell, at whose invitation the members assembled at Fron Hall, Market Deeping. Amongst the motorists who attended were Mr. and Mrs. George Linnell (Market Deeping), Mr. and Mrs. Charles Pennell (Lincoln), Mr. G. H. Mays (Bourne), Dr. Benson and Mr. Carter (Market Deeping), Dr. and Mrs. Cragg (Billingborough), Mr. Pick (Stamford), Mr. and Mrs. Smith (Thrapston), Dr. and Mrs. Husband (Crowland), the Rev. and Mrs. Taylor (Boston), Dr. and Mrs. Gilpin (Bourne), Mr. F. D. Tryon (Stamford), Mr. Henry Tryon (Market Deeping), Mr. T. S. Shipley (Bourne). In addition there were seven Spalding motor-cyclists present—Messrs. W. White, H. Pennington, J. Peake, W. Jepson, J. Savage, C. Gibson, and G. Hercock. Mr. and Mrs. Linnell entertained the visitors in a very hospitable manner, and altogether the day, despite the rain, was a very enjoyable one.

MANCHESTER.

THE Manchester Automobile Club had a run on Saturday last to the Brine Baths Hotel, Nantwich. This run has always been popular with the Club owing to the number of routes leading to Nantwich. It is also a sort of half-way house to Chester and North Wales. Unfortunately the weather was very bad, and some of those who had the courage to start out turned back. The Hon. Secretary arrived at Nantwich some little time before any other cars turned up, and was afraid that his was going to be the only car there, but as the time for dinner drew nearer car after car arrived until a total of thirteen was reached, and forty enthusiastic motorists who had braved the elements sat down to dinner.

MARKET DEEEPING.

THE members of the Market Deeping Automobile Club have been entertained to a dinner at their headquarters, the New Inn, by the president, Dr. Benson, J.P. Among the guests were Messrs. E. Sutton, J.P., Tryon, Pick, Moor, Dalton, Greenfield, Carter, Stevens, and Wilson. After dinner, the Pick Motor Co. exhibited six of their new cars, and demonstrated the action of their new automatic governor on the engines.

THE SCOTTISH CLUB (WESTERN SECTION).

A MEET of members and their friends took place on Saturday last at Tarbet, Loch Lomond. The day was fine, though somewhat cold, and the roads were rather dusty. About thirty cars were brought to the meet, and after tea in the hotel and an hour or two spent by the loch side, the party returned to their several destinations. The bulk of the Glasgow cars went and returned via Alexandria and Luss, but a number took the Garelochhead and Whistlefield Hill route one way, while others crossed the hill from Luss to Helensburgh, or returned via Drymen and Bearsden. The following motorists were present: Messrs. J. W. W. Drysdale, Glasgow, 8-h.p. Albion; J. Milne-Barbour, Greenock, 10-h.p. Wolseley; H. Barbour, Ireland, 22-h.p. Daimler; J. Adam, Glasgow, 10-h.p. Wolseley; D. H. Anderson, Albion; H. E. Smith, 10-h.p. Argyll; L. G. Seligmann, 7½-h.p. Wolseley; Fred Lobnitz, 10-h.p. Argyll; J. Hunter and C. J. Campbell Steen, 10-h.p. Wolseley; W. Holms-Kerr, 10-h.p. Panhard; Wm. Weir and J. R. Richmond, 24-h.p. Darracq; H. Prosser, 10-h.p. Wolseley; John Shaughnessy, 8-h.p. De Dion-Bouton; T. B. Murray, N. O. Fulton, and J. F. Henderson, 12-h.p. Albion; H. M. Napier, 10-h.p. Wolseley; Alec Govan, 10-h.p. Argyll; C. E. Ball, 16-h.p. De Dietrich; G. H. Christie, 12-h.p. Arrol-Johnston; A. G. Rennie, Clement; R. J. Smith, 10-h.p. Wolseley; J. B. Shanks, 12-h.p. Daimler; W. McOnie, 7-h.p. Panhard; Ebenezer Blakely, Duryea; and W. Hunter Steen, 9-h.p. Darracq.

YORKSHIRE.

MANY members of this Club met at Harewood on Thursday of last week in order to view Harewood House and grounds, which were open for inspection. They spent a thoroughly enjoyable afternoon, the weather continuing fine and the roads in the surrounding districts being in excellent condition. Amongst those present were Messrs. Gwyne, Watson, and Wilson, with Mr. Hey, on his 24-h.p. Spyker car; Mr. and Miss Armitage, 11-h.p. Clement; Mr. Owen Brooks, 2½-h.p. bicycle; Mr. C. Parker, 4½-h.p. bicycle; Mr. and Mrs. Beevers and Mrs. Jessop, 8-h.p. M.M.C. car; Mr. and Mrs. Booth, 6-h.p. Prunel; Mr. J. V. Kinsley, Oldsmobile; Mr. Steele Benz; and Mr. and Mrs. Exley, 6-h.p. Beaufort car.

FURIOUS DRIVING CASES.

IN addition to being fined for alleged furious driving, Mr. G. H. Kirk was mulcted in a similar sum for not stopping his car when a restive horse was in sight.

At Croydon, on Saturday, Alec Ross was fined £5 and costs for driving on May 16th a motor-car at the rate of nearly 22 miles an hour at Wallington, down a hill marked "Dangerous to cyclists." The chairman of the Bench said that he trusted Mr. Christy, owner of the machine, who was in the car, would reimburse defendant.

MR. JAMES E. COLLIN, who was fined £5 at the Suffolk Petty Sessions for driving a motor-car at a greater speed than allowed by law, has applied for leave to appeal against the decision of the Court at the next Quarter Sessions for the county of Suffolk. Leave was given, and Mr. Collin entered into a bond of £25 to proceed with the appeal.

IN the case of Major Stapylton, heard at Knaresborough, it appeared that the offence was detected in an unusual manner. Superintendent Kee stated that on May 30th he was travelling by the 4.43 p.m. train from Knaresborough to Boroughbridge, and when the train was passing over the Ferensby Road railway bridge he saw the defendant riding in his car on the road with another gentleman. Upon reaching Boroughbridge eleven or twelve minutes later witness proceeded into the Market Place, which took him about three minutes, and there he saw Major Stapylton drive up in the car. Witness spoke to him, and told him he would have the distance measured. He did so, and found that from Ferensby Road railway bridge to the Market Place the distance was four miles and 1,364 yards, so that the defendant had travelled at the rate of 19 miles an hour.

* Motor-Cycle Cases.

POLICE TRAPS.

It is probable that a police trap will shortly be laid at Bagshot.

ON the Drayton to Taverham road (Norfolk), the police have measured half-a-mile of road with a string forty-five yards long. In working the trap one constable, according to evidence given in the cases at Norwich, "secretates himself behind a fence."

MOTORISTS driving through Beckenham from any direction should be careful, in view of the renewed activity in that district.

THERE has still been another police trap discovered in Yorkshire, viz., on the Wetherby to York road, from the top of hill in Acomb village to the schoolroom—quarter-mile. Almost all the other traps recently reported are still in operation.

CLAIM FOR DAMAGES.

C. P. TYRE sued Herbert Skett, of Birmingham, for damages and personal injuries sustained in an accident on the Stratford road on March 12th, caused by the negligence of the defendant by allowing a horse to stray on the road. The claim was for £50 damages, part of which was made up of loss of time for two weeks, damages to motor-tricycle £72s., and doctor's bill £3. The plaintiff, with his brother and a friend, were returning from Henley-in-Arden on the day in question. The friend was riding a motor-cycle; plaintiff was riding a motor-tricycle, while his brother was in the trailer. When near the "Plough," at Monkspath, they saw something on the road, which afterwards turned out to be a horse. They attempted to pass it, but the horse jumped right in front of them, and they ran into it. The plaintiff was not seriously hurt, but was badly shaken. The horse was not damaged. His Honour found for the plaintiff, but considered the claim for loss of time extravagant, and gave judgment for £10 5s.

WORK FOR THE TRADE.

AT Brompton County Court (London) last week, the case of the Locomobile Company of Great Britain against Mr. William Stonebridge, reported in our last issue, was concluded. Mr. J. Paviot, the owner of the motor-car in question, said that he was now in the trade. He told the defendant that the account for repairing the car was not to exceed £3, but when he went to plaintiffs' works he saw that certain work besides the repairing of the steam pipe ought to be done. His Honour intimated that he considered the defendant should pay for the item relating to the repair of the steam pipe, £3 7s. Counsel for the defence said the custom of the trade was for a small firm sending special work to a special firm, as in the present instance, to get a discount and profit on the job. His Honour now gave judgment for plaintiffs for £3 7s. and costs.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

COMMENTS.

NEXT week will see a great influx of motor cars and motorists into Ireland, and the whole of the country will be given up for a few days to the excitement associated with the sport of automobilism. In view of the many dangerous corners in the country districts, through which the official tour will take place, we would seriously counsel drivers to be unusually careful not to do anything to mar the joyousness of the event. British

motorists, as well as the people of Ireland, are anticipating with a great amount of pleasure the forthcoming events, and anything like a serious accident would cast a shadow over the whole proceedings. Continental drivers, unfamiliar with the practice of English and Irish roads, should be warned, and the fact impressed upon them, that the rule of the road as we know it will be strictly adhered to by the authorities. So great is the interest taken by the peasantry in the Automobile Fortnight, that they are likely to be found on the most unlikely stretches of road, and the precaution which we have already given must not be regarded as only intended for small towns and large villages, but equally applicable in Dublin, Belfast, and Cork. By showing a careful consideration for the convenience of others, and proving that a monster motor-car meet can be carried on without mishap, motorists will do much to disarm the prejudice which has been revived during the last few months. Hence it is that we trust everyone who participates in the tours, whether those arranged by the Club or as individual motorists, will recognise the dis-service he will be doing the industry should he not show the consideration which will be due to our hosts.

Nothing Niggardly Wanted.

MANY rumours, based on a little fact, and expanded with much capacity for imagination, have been in circulation with regard to the abandonment of the race. Nothing of the kind need be feared, and the only surprise is that such reports have been heard at all. The Government surely must recognise that this is something more than a local event; it is one of national importance to Ireland; and although the people of only three counties will see the actual contest, the whole of the country will share in the kudos that the event will take to Ireland. Hence the suggestion that the Treasury have adopted a niggardly hand with regard to the payments for the police and the troops seems unworthy of officials charged with the duty of giving encouragement to anything likely to be to the general welfare.

Caution to Drivers in Ireland.

THE committee of the A.C.G.B.I. request and require that all persons driving motor-cars in Ireland shall conform to regulations throughout the Irish fortnight. It must be borne in mind that the inhabitants of most of the districts of Ireland are quite unused to motor traffic. Many horses are unaccustomed to motor vehicles. They are apt to shy, and in doing so, they back the carts across the roads, and as Irish carts have shafts projecting at the back some four feet, the whole of

the road may thus be blocked. Under these circumstances the Committee of the Club most strongly deprecate travelling at any except most moderate speeds. Passing when overtaking in going down hills or corners, or in passing through towns or villages, is strictly prohibited. Racing between cars will be dealt with most severely. Members of the Club are asked to co-operate with the Committee by reporting drivers (members of the Club or otherwise) who infringe these arrangements, in order that they may be dealt with at a meeting of the Club Committee to be held after the great race.

The Thousand Mile Trial.

THIS year's great event of the Automobile Club will be held from September 4th to the 12th, starting from and completing each day's run at the Crystal Palace. The organisation committee is representative of the Club, and also of the trade, whilst the judges are not connected with or financially interested in the industry. The awards will take the form of gold and silver medals, and will be made by adding together the marks gained by each car during the trial for reliability; cleaning, replenishing, etc.; hill-climbing; condition after trial; brakes; steering; absence of noise; absence of vibration; absence of vapour or smoke; absence of dust raising; speed on track; re-starting on hill; finish and appearance; general cleanliness of motor and gear; fuel consumption; accuracy of h.p.; and cheapness. The principle underlying the rules is, that the trial is a test of a reliability. There are to be hill climbs, and in these speed, the number of passengers and price will be considered, but in calculating the total of marks to be given, the features already mentioned will weigh very considerably with the judges. There will be seven classifications of motor cars, and entries must be sent in to the Club not later than noon on Saturday, July 11th, that is, if manufacturers or owners desire to secure an entry at a fee of £5. After July 11th, the entry fees will be increased twenty-five per cent. per week, no entry being accepted later than August 15th. Observers will be appointed as was the case last year, and the methods of marking which are already fairly familiar to those practically interested in the event, have been well devised. The programme includes runs to Folkestone, Eastbourne, Worthing, Winchester, Southsea, Bexhill, Margate and Brighton, the total mileage being 1,014.

"Our Barometer."

THE long list of furious driving cases recorded in the *Journal* of the 13th inst., has been the subject of much comment in the press. The "Automobile Club Journal" recognises that we are "doing good service by publishing weekly a summary in tabular form of the various prosecutions for exceeding the speed limit. It serves as a faithful barometer of the state of public feeling in regard to automobilism throughout the country." The "Globe" also mentions that our list "contains no fewer than 125 cases, with the laconic announcement that pressure on its space prevented the publication of the full list." Both our contemporaries recognise that the lists have been useful in proving the increased activity of the police—an activity which is not confined to any particular part of the country. Although

police methods of timing speed are ludicrously inaccurate, we may take it for granted that the majority of the defendants were really transgressors of the law, although it is equally true that the greater number inconvenienced no one, and endangered no lives. It would be impossible to exaggerate the extent of the injury to the automobile industry which is being done by the police in their present mood, and only by an adequate public record being made can it be hoped to secure some reasonableness in their attitude.

tively few hours with regularity and economy—two qualities that appear somewhat new to the native mind.

Motor-Car Legislation.

◆ ◆ ◆
 WITHIN the next fortnight, says the "Daily Telegraph," the Government will introduce a measure in the House of Lords for the better regulation of motor traffic. As yet, the details of the bill have not been finally decided upon. It may be taken for granted, however, that provision will be made

Snapshots in Algeria.

In Algeria.

CA 1388

A MEMBER of the A.C.G.B.I. who recently enjoyed a long motor-car trip in North Africa has favoured us with a selection of photographs before which even the anticipations of Ireland grow dim. What possibilities of seeing new lands and looking upon strange customs are possible to the motorist. Lands only narrowly scanned by the railway traveller and impossible to the ordinary wayfarer are brought within measurable compass by the automobile. At Sfax he saw the automobile illustrated on this page—a 12-h.p. Panhard car driven by a native driver, used in the postal service. Long since it was an object of excitement to the populace. There the postal authorities are a long way in advance of St. Martin's le Grand. A journey that ordinarily occupies four days when the mails are carried on camels is performed by the automobile in a compara-

for the numbering and registration of motor-cars, the licensing of professional drivers, the increase of penalties for breaches of the law, and the modification, if not the abolition, of the speed limit. On Tuesday General Laurie asked the Home Secretary whether his attention had been called to the case heard at Marlborough Street Police Court on the 16th inst., when a motor-car driver was convicted of driving furiously in Hyde Park, and to the comments of the magistrates when passing sentence upon the grossness of this case and the inadequacy of the fine of £5 that he was empowered by law to pass; and whether, in view of infractions of the law by motor-car drivers, and the consequent danger to the public, he would obtain legislation to enable magistrates to inflict adequate penalties for this particular offence, pending the introduction of the bill for the general regulation of motor-cars. Mr. Akers-Douglas in reply said he had received a report of the case referred to and was inquiring into it. He

thought the question of increased penalties was one which would certainly be considered in the bill about to be presented, a remark which elicited loud cheers.

Motor Volunteers.

On Tuesday instructions were issued from the Home District Headquarters respecting the organisation of the new Motor Volunteer Corps, which is described as "composed of gentlemen who are owners of motor-cars, and who are willing to parade with their cars when required for military purposes, such, for instance, as the defence of the country, manoeuvres, staff rides, &c." The establishment sanctioned provisionally is to be 203 officers and men, made up of one lieutenant-colonel (commanding), 6 majors, 19 captains, 19 lieutenants, and 155 Volunteers (privates), with a permanent staff of one adjutant and two sergeants. With the headquarters in London (11, Tothill Street, Westminster), the corps will be divided into five commands, distributed as follows: (1) Aldershot; (2) Salisbury, with subordinate commands at Plymouth, Portsmouth, and Dover; (3) London, with subordinate commands at Woolwich, Chatham, Colchester, Guildford, Hounslow, Kingston, Oxford, Reading, and London; (4) York, with subordinate commands at York and Chester; (5) Scotland, with subordinate commands at Glasgow and Edinburgh.

A Unique Test.

So marked has been the progress in motor construction at the Hozier Engineering Company's works in Glasgow, that Mr. A. Govan, the managing director, decided to make an experiment which we believe is unique—at least, so far as Scotland is concerned. Mr. Govan's idea was to take an Argyll car straight from the factory and make a non-stop run over the S.A.C. trial course without any preliminary running whatever. For this purpose he obtained the assistance of Mr. Hall Brown, Vice-President of the Institute of Engineers and Shipbuilders in Scotland, who selected a chassis from amongst a number for the trial. Mr. Brown watched the assembling and fitting of the parts, and, when the car was declared complete, he sealed it up so that it could not be tampered with in his absence. On Saturday last Mr. Brown again examined the vehicle, which was then driven out of the factory to the centre of the city, and, with its full complement of four passengers—Mr. Govan being at the wheel—started from the Royal Exchange on its trial trip. The course, abounding in steep hills, led through Dumbarton and Helensburgh to Garelochhead, and thence to Tarbet, the famous hill at Whistlefield being climbed *en route*. From Tarbet the car ran along the loch side to Crianlarich and back, the return journey to Glasgow being by way of Luss, Alexandria, and Bowling. The trip was in every respect a success. Every hill was taken at good speed, and the roughest parts of the road were covered without any undue unpleasantness—a signal proof of the excellence of the car and its equipment. From beginning to end not a single part of the mechanism was touched, the car being returned to the works exactly as it left them after undergoing the arduous test. Although nothing in the way of racing was attempted, the 107 miles were covered in 4 hours 53 minutes. The car was a standard 10-h.p. Argyll, built to the order of Dr. Paul Rottenburg, ex-President of the Glasgow Chamber of Commerce.

Reducing Dust on Sussex Roads.

AN experiment now being made on the Sussex roads by the Surveyor of the West Sussex County Council, Mr. W. R. Purser, is likely to attract general attention in the South of England, where the system applied is a novelty. The "Sussex Daily News" refers to the stones used as Cherbourg quartzite. These are first of all put under a drying process at the galvanised iron shed at the County Council depot in Horsham. After being well heated the stones are spread out and allowed to become somewhat cool. They are then deposited from five to

six inches thick on a wooden platform and treated with tar, about five gallons of the latter with a little pitch being sufficient for a ton of stone. Each stone is thus given a coat of shining blackness. After undergoing this process they are wheeled into one large heap, and allowed to become matured. The stones are now being carted to Monksgate, on the Brighton road, and spread to an average thickness of about five inches. The stones are consolidated by a ten-ton steam roller, and afterwards clean sand is sprinkled over the surface just for a covering. About 100 tons of quartzite stone have been used, and will be sufficient to lay down upon a length of from 125 to 150 yards of road according to the breadth. Having undergone the tar treatment it is assumed that a longer life is given to the stone, averaging from twenty-five to thirty-five per cent., according to quality. Several advantages are claimed for roads where these experiments have proved successful, the most powerful argument to motorists being the fact that no dust is raised by passing vehicles.

Mr. H. T. Thomas on the Oldsmobile Racer which covered a mile in 1 min. 6 1-5 secs. on the Daytona-Ormond Beach, Florida.

Inoffensive Identification.

MR. E. J. HALSEY, the chairman of the Surrey County Council, has revived Earl Russell's suggestion that the Local Government Board should make a regulation to the effect that every motor-car shall have a small plate affixed to it bearing a registered number engraved thereon corresponding with the licence that has been taken out. The practice already in force in regard to boats upon the river Thames is thus suggested for automobiles. While admittedly not a perfect remedy, this practice would, at any rate, tend to the more easy identification of the offender, while no one could reasonably complain of it on the score of undue interference. Stripped of the suggestion with regard to licensing, we believe this is quite in accord with the proposal of Earl Russell at the memorable meeting at the Automobile Club, and we would like to see it have greater prominence in the discussions which take place on the subject from time to time.

Hedges and Warning Boards.

IN Hampshire and in Yorkshire some of the local councils have come to the decision to erect warning boards for motorists; a course that will commend itself to many who have had to incur the danger that arises from coming suddenly upon steep gradients. At a meeting of the Driffield Rural Council, a member advised that a local landowner should be approached with a view to the removal of a bank and hedge at the corner of a road, as it was a source of danger to drivers. We gladly recognise the good work that is going on throughout the country in encouraging local people to do their duty with regard to roads and hedges. The onus does not lie wholly with the motorist.

The Derby Club.

UNDER rather more pleasant conditions than have lately prevailed, the Derby and District Club have had a run to Uttoxeter. This was at the invitation of several of the local motorists, and took the place of the outing to Foremark Hall, the sad bereavement which Mr. Lawson has sustained causing that fixture to be abandoned. The members met at Ashbourne, journeying thither independently, and proceeded thence to their destination, being joined at Rocester by their Uttoxeter friends. An excellent tea was provided at the White Hart, these and all other arrangements being kindly made by Mr. Ellis Chambers, who spared no pains to make the visit a successful one. Shortly after six o'clock the cars began to return to Derby, via Sudbury, the evening, though somewhat cool, being very pleasant, and the roads in fine condition. The following members took part:—Mr. Schwind, 16-h.p. Rex; Mr. Leech (hon. treasurer) 8-h.p. Decauville; Mr. Allin (hon. secretary) 8-h.p. Rex; Mr. Hunter, 6-h.p., Darracq; Mr. Pounds, 4½-h.p. Benz; Mr. Reading, 5-h.p. Stirling; Mr. Guest, 9-h.p. De Dion; Mr. Fletcher, 3½-h.p. Star; Mr. F. Smith, Clyde bicycle; and Messrs. Smith and Collum, Excelsior bicycles.

An Extreme Case.

THE recent case at Melbourne (Derby) when Mr. Lawson's mechanic was fined for exceeding the legal limit when taking Dr. Tredinnick to the aid of the late Rev. T. Orrell, has excited great indignation among the members of the Derby Club. The Club sternly sets its face against reckless or furious driving, but taking into consideration the extreme urgency that was undoubtedly necessary upon the occasion in question, it deeply regrets the decision of the Melbourne magistrates. The argument that "someone might have been killed" in the face of the fact that a person was undoubtedly dying, and that every second was of value, surely savours somewhat of hysteria, and a lack of knowledge of the brake power (so constantly demonstrated) of the modern motor-car.

The Suffolk Club.

ANOTHER automobile club has been formed in East Anglia, and at Bury St. Edmunds an organisation for that town and West Suffolk is now an actuality. A preliminary run was held the other evening to Higham, where a meeting was held at the Station Hotel, Mr. A. O. Clark being in the chair. The Bury and West Suffolk Automobile Club was then inaugurated, and tribute paid to the tolerant attitude of the police of the district. A further meeting will be held at Bury St. Edmunds on Monday next, at which the Mayor is expected to take the chair, and it would seem that there are good prospects of success.

Legislation in the States.

THE new automobile legislation in the State of New Jersey requires drivers of automobiles in that State, under the Scovel Bill, to make a declaration as to their ability to run their vehicles, and to give a brief description of them, including the name of their manufacturers and their rated horsepower. If this declaration is satisfactory, a licence will be issued for each machine upon the payment of one dol. Numbers of a given size will take the place of letters for purposes of identification on the road, and at night these numbers must appear on the lamps of the vehicles and be visible 200 feet away. On signal from a person riding or driving a horse or horses coming toward the automobile, the driver of the latter must stop his machine and remain stopped for the horse or horses to pass. A fine of 100 dols., or imprisonment for thirty days, is prescribed for displaying a fictitious licence number; 50 dols., or twenty days' imprisonment, for racing; 25 dols. for failure to display a licence number; and 10 dols. for failure to carry the proper lights. For violating the speed regulations the fines range from 10 dols to 50 dols., and for second offences they are, in each

case, to be doubled. Speed must not exceed 10 miles per hour at turns and cross-roads, or twenty miles anywhere else.

The Biograph and the Motor.

ON Monday, a theatrical ladies' motor meet was held, and the success of the first gathering of the kind has warranted the pleasing event becoming an annual function. Organised by Mr. Arthur Vincent, and held under the auspices of the Biograph Company, the meet took place at the Oatlands Park Hotel, Weybridge, the guests being conveyed in privately owned vehicles kindly lent by their respective owners. After luncheon the company filed before the Biograph, and a representation of the scene is now delighting the patrons of the London halls every evening.

A Piece of Presumption.

A READER calls attention to a piece of impudence on the part of the proprietor of a motor-car garage which we hope is a *rara avis*. He recently stabled his car at a certain garage in the Midlands, and one day, when going for his vehicle, discovered the manager starting out for a run on his car accompanied by a friend. Such action is quite unpardonable and should be brought to the notice of the local Automobile Club.

Learning to Drive.

SOME time ago the Automobile Club decided to purchase a car to teach members or their servants how to drive, and as much of the working details of the motor and gear as could be expected to be picked up in a short time. Arrangements were made to give a course of fifteen lessons of one hour each for a fee of £3 3s. In actual practice this has been found quite a sufficient time to teach a man to drive with safety under ordinary conditions, either of country or traffic; readiness and resourcefulness in an emergency can only come by experience. The car purchased, which began work in June 1902, was a 7-h.p. Star, and this has been found to be an excellent one for the purpose, not a single stoppage having occurred through derangement of the machinery. No less than twenty-three members have taken advantage of the facilities offered by the Club, and twenty-two have had their servants taught. Two ladies have also received instruction. The course of lessons consists in three or four hours' instruction in grinding in valves, principles of the motor and gear, ignition, carburettor, etc., and the rest of the time is devoted to the actual handling of the car; manœuvring in and out of the garage, driving in the Park, and then in the traffic. After forty-five novices have learnt to drive on the car, and there is no sign of damage to the gear or other parts. It may be safely said that the scheme has proved itself an unqualified success, and is undoubtedly a very great advantage to the members.

Motor-Cars at the Meet.

IT is common knowledge that in certain parts of the Midland counties strong feeling has lately been demonstrated against motor-cars anywhere in the neighbourhood of hounds—still more against their being employed directly or indirectly as aids to the hunting field. A correspondent of the "Field," who acknowledges he is not yet educated out of the horseman's natural aversion to automobiles, has, during a visit to the New Forest, arrived at an appreciation of the fact that there they are quite recognised factors of the chase. "You find them at every fixture, and they take part even in penetrating the by-roads of the forest, while on the main roads they whirl by in an atmosphere of dust which shrouds you for some minutes. Their nerve-shaking bellow mingles almost blasphemously with the huntsman's horn, and they roar upon you as they descend upon horse and carriage with the reckless violence of a typhoon." A bit of graphic writing, doubtless; but somewhat inspired by prejudice. The attitude of the Earl of Shrewsbury—as illustrated recently in the *Journal* shows greater tolerance.

The Gordon Bennett Cup Race.

NEVER before have British and Irish motorists been provided with such an interesting series of events as that about to take place in Ireland, and the victory of Mr. S. F. Edge in the Gordon Bennett race last year has proved something more than an impetus to the British automobile industry; it is likely to result in such an influx of visitors to Ireland as will prove a substantial gain to the Cinderella among British islands.

In this issue we give the programme for the forthcoming series of events, together with information as to the firms supplying petrol, etc., on the line of route, as well as the official headquarters of many of the leading automobilists represented.

Although the chief event will take place on July 2nd, the other incidents of the tour will be of great interest and importance, while hundreds of motorists are going over to Ireland independently of any official arrangements.

To encourage the development of the automobile industry was the object of Mr. James Gordon Bennett in offering a cup for international competition, and although the results of the annual events held in connection therewith have been of varying interest, the scheme remains as a tribute to his foresight and enterprise. The first contest was held on the Paris-Lyons road in 1900, when only two cars finished out of five, France being represented by M. Rene de Knyff, Girardot and Charron on Panhards; Mr. Winton was the sole representative of the United States, and M. Jenatzy appeared on behalf of Belgium. Mr. Edge's entry was vitiated by the fact that his tyres were alleged not to have been of English manufacture. In the following year the course was from the French capital to Bordeaux. Mr. Edge was the English representative, and France—as this year—had two Panhards and one Mors car in the race. Last year's contest was run in conjunction with the Paris-Vienna event, and the result was to bring this year's contest to our own shores. Briefly reviewed, the results hitherto have been as follows:—

Year.	Winner.	h.p. of Car.	Average Speed m.p.h.
1900	Charron	24	38.5.
1901	Girardot	50	39.5.
1902	S. F. Edge	40	34

The 1903 course is now in excellent repair, bends straightened, right angles rounded, and hedges clipped low for 200 yards on the approach side of each corner. Caution and danger signals will be set up at all possible accident points, and responsible road stewards, with flags, will warn approaching cars of unforeseen road obstructions.

The racecourse will be closed to traffic at six a.m., all side roads and paths blocked, and police officers stationed at the joining point of racetrack and side roads. Large green banners stretched entirely across the road indicate a corner within 300 yards. A small triangular green flag suggests caution in driving for the next quarter mile. A large flag, half green half red, warns the driver he must stop dead in 300 yards. A large red banner

The Gordon Bennett Cup.

stretched across the road means stop.

Surveyors and contractors have each worked well, and enthusiasm shown locally should result in a splendid success. The work has been done very satisfactorily and a portion of the track will be sprinkled with oil, this being carried out on the suggestion of Lord Deerhurst. More than 270 roads leading to the course are to be closed on the day of the race. At each of the highways a couple of policemen will be stationed, whilst the barricades may be expected to prove effectual in restraining the ardour of the people in getting too close a view. The entire district has been posted with the following notice, which certainly

has the merit of brevity:—

"GORDON BENNETT RACE.

ON THURSDAY,

The 2nd day of July, 1903.

WARNING.

"All occupiers of premises on or near the course of the above-mentioned race must keep their live stock, pigs, dogs, poultry, and cattle under proper control, either in farmyards or well-fenced enclosures, during the progress of the said race.

"Any person on the road, or attempting to cross the road during the progress of the Race, will imperil not only his own life, but that of the driver of the racing motor-car."

The contestants will be as follows:—

GREAT BRITAIN (Green).

Messrs. S. F. Edge, C. Jarrott, and J. W. Stocks.

FRANCE (Blue).

MM. Rene de Knyff, H. Farman, and F. Gabriel.

THE UNITED STATES (Red).

Messrs. A. Winton, Louis Mooers, and Percy Owen.

GERMANY (White).

Baron de Caters, M. C. Jenatzy, and Mr. Foxhall Keene.

ABOUT THE CONTROLS.

At Ballyshannon, where the start will take place at 7 a.m. on the morning of Thursday next, the road is only 14 ft. wide, and it must be confessed that the decision to start the cars at intervals of seven minutes is a wise one. By lengthening the interval of starting, the chances of cars overhauling one another have been considerably minimised, and it is quite possible that some of the passing may be done within the control. In charge of the timing arrangements will be Mr. R. E. Phillips, who will be assisted by a corps of volunteers in a duty the importance of which cannot be minimised.

The controls will be as follows:—Castledermot, Carlow, Athy East, Kildare, Monasterevan, Stradbally, and Athy West. At each of the controls there will be three motor-cyclists, and at Kildare, Monasterevan, and East Athy fifteen ordinary cyclists. Ordinary cyclists will also be posted at Ballydavis, Bloomfield cross roads, Simmon's Corner, and the turn where the cars will branch off to the eastern circuit at Old Kilcullen. Others may also be stationed at Mageney Bridge and Hacklow Corner.

At the commencement and end of each control there will be placed in a conspicuous position a large chronometer, fitted with a seconds hand, by which the competitors and the bystanders can see at a glance the time of the arrival or departure of the car at the control point. We believe that the official timekeepers will at once write up on a blackboard the official time of the car. On the arrival of a car at a control, the official time of its arrival will be also written on a card, retained by the competitor. The same procedure will be followed on a competitor leaving the control post. By this plan the competitor will be possessed of his official times for every point throughout the race.

THE COURSE.

The course, starting from Ballyshannon, lies in a northeasterly direction to Kilcullen, the Hacklow cross-roads presenting the first nasty turn. Across the Curragh—a fine stretch of $4\frac{1}{2}$ miles—and just beyond the hospital, Kildare comes into view.

is another turn that will require nerve as well as skill to get safely over.

The high ground in the locality of the Rock of Dunamase will give some vantage points much in favour, while the hill past the famous rock will test the prowess of even the most powerful cars. Fortunately, there is a good width in the highway succeeding which leads to the long, wide main street of Stradbally. On the east side the ascent to Windy Gap will give the competitors some idea of hill-climbing, and the spectators as fine a view as any over the whole course. Just before Ballylynan is Simmon's Corner, one of the sharpest angles of the course, and then, to Athy, the widest part of the course will be rushed through.

Athy is one of the most considerable places on the course, and there is likely to be a great multitude of people at that point, as it is the beginning of a stretch over which the cars will travel seven times. Past the Moat of Ardsclull the cars will rattle, and Messrs. Mecredy and Percy's party will doubtless give

Map of the Course.

Thick Lines show Course to be covered by cars. Double Thin Lines indicate main roads to different points of Course. Crosses represent Railway Stations. Controls are shown by small circles.

From many reasons, this town (although its population is only about 1,200) has assumed the position of being the most important centre on the course, the main roads therefrom leading—as is shown in our sketch map—to Athy and also to the starting point of the race.

The end of the Kildare control is nearly two miles from the picturesque market square, and, after a somewhat sharp turn has been negotiated, Monasterevan is reached, the Canal bridge being a notable "bump." The road, however, is level all the way, a bad culvert having been minimised for the purpose of the race by building up the road on both sides for quite thirty yards. By the main road therefrom a good many people will reach Athy. Monasterevan is of some ecclesiastical interest, and near the town are the residence and demesne (Moore Abbey) of the Earl of Drogheda. East of the gates of the latter is a stalwart hill, giving sightseers a good, clear view of the road for three miles or more. Crossing the river Barrow, an awkward canal bridge has to be surmounted, and there is then a straight run of nine miles to the Ballydavis cross roads. There, again,

them a hearty welcome. Several well-known motorists have booked places there. A straight run to Kilcullen will give the spectators along thirteen miles of road a splendid opportunity of seeing the cars at full speed. Kilcullen has seen some notable contests, its last great disturbance being the insurrection of 1798, when the town was the scene of a great conflict between the Government forces and the insurgents. Turning sharply to the south the route will be through Ballitore and Timolin, the rectory of which latter place has been the headquarters of the American team, while at Fontstown the cars will pass Colonel Baring's house, which Mr. Harvey du Cros has made his headquarters.

A round tower stands out conspicuously at Castledermot, where the ruins of a monastery founded early in the fourteenth century remain. Then there will be a skurrying to Carlow, which is the next prominent place to be traversed—one of the first towns in Ireland lighted by electricity and having a lovely situation on the river Barrow. There will be a sharp bend round the Courthouse in the main street. From thence to Mageney

Bridge is a curly stretch of five miles, and some fairly sharp turns will have to be taken with care. We do not anticipate the speed of the foremost cars over that stretch will be half the average for the whole course—so difficult are the turns.

THE CUP CARS.

Although most of the types of the cars which will compete in the 1903 Gordon Bennett race have already been dealt with in the *Journal*, a summary of their leading features will not be without interest at the present time.

To begin first with the Napiers, no less than three distinct types have been built to meet the challenges the United Kingdom has received as holders of the cup. One set with engines rated at 35-h.p. was built in the expectation, early in the year, that the race would have to be run in France, and afterwards a trio of motors, said to develop 30-h.p., were put in hand. Both types of vehicle are very much on the lines of last year's winner; they are fitted with four-cylinder engines having the ordinary high-tension system of ignition, while the governor is adapted to act on the throttle. The water circulation is maintained by a friction-driven pump and Clarkson radiators. Four speeds

Probably the most striking vehicle to be found among the dozen which will take part is that which will be driven by Mr. Alexander Winton, the first of the American team, the feature being the employment of an eight-cylinder horizontal engine set across the frame. The following is the brief description of the vehicle as supplied us by the Winton Co.:—"Its motor has eight cylinders, cast iron pistons and rings; sectional construction of water jacket; aluminium water shell. The motor may be described as two units, of four cylinders each. Each four-cylinder unit has an independent water-circulating centrifugal pump. A single radiator and a single carburettor answer for all eight cylinders. Bore of cylinders, 5 inches; stroke, 6 inches; drop-forged connecting-rods, bronze bushings, float-feed lubrication, with syphon wicks, and gravity oil distribution. The cylinders are horizontal, all on one side of the fore-and-aft eight-throw crank-shaft, which has a bevel-gear transmission to the balance gear drum; 1 to 1 $\frac{1}{2}$, 700 revolutions of motor shaft per minute, driving the vehicle at 64 miles per hour, with 32-inch driving wheels, and 4-inch Goodrich double-tube tyres. Wheel base, 114 inches; wheel gauge, 56 inches; weight, 2,150 pounds, tanks empty; petrol capacity, 22 gallons. This car has no reverse

Mr. L. P. Mooers on his Peerless Racer, on arrival at Dublin.

[Lafayette, Dublin.

forward and reverse motion are provided, the power on the top speed being transmitted direct, no secondary gear wheels whatever being in motion. Like last year's racer, the new cars are provided with a live axle, power being transmitted from the gear box through a longitudinal universally-jointed shaft and bevel gearing. The frame is built of steel and wood. The road wheels are of equal size, 34 inches diameter, and shod with 90 mm. tyres, the wheel base being 7 ft. 10 in.

Since the above vehicles were completed, two cars of a much more powerful type were put in hand and may be driven by Messrs. Edge and Jarrott. In general arrangement these vehicles are the same as the smaller cars, a direct drive to the live axle being secured on the top speed. The engines are said to develop about 110-h.p. In order to get sufficient weight for adhesion on the driving wheels, the engines are fixed much further back than usual, being behind the front springs instead of between them as usual. The bonnet is said to measure 4 ft. 2 in. from back to front. The wheel-base is 9 ft., and the wheel gauge 4 ft. 2 in. The aim has been to produce a car which shall be extraordinarily quick in starting and stopping, so that it may attain the highest speed practicable at any point in the shortest possible time, and will not need to slow down till the last moment at curves or other places where the pace must be reduced.

and can only be driven forward. The original design had two speeds forward and a slow speed reverse, all of this variable gearing weighing only 50 lbs.; but after trial this change gear and reverse, appearing to serve no useful purpose, was discarded, and the car now has a clutch from the motor shaft to the bevel pinion shaft, and one fixed ratio forward gear only. The chassis is of ash scantling, three and one-half by two inches, armoured with steel plates 1-16 inch thick. There are two brakes on each rear wheel hub, independently actuated, one brake being applied to the outside of the cylindrical brake shell, fixed to the wheel hub, and the other brake expanding by a reversed bell-crank action to co-act with the interior surface of the same cylindrical brake shell, or drum. The steering is by hand wheel, tangent screw and worm gear sector, with globe-end bell crank and tubular rod connection.

The spark advance is by hand. Jump sparking plugs are used, one battery and one coil for the eight cylinders, a second reserve coil being fitted for use in case of failure of the first. Dry cells are employed, as giving better results than any type of American storage battery tested." The Winton car to be driven by Mr. Percy Owen is practically a replica in miniature of Mr. Winton's, it having a four-cylinder horizontal engine, and weighing 1,450 lbs. with tanks empty.

The Peerless car which Mr. L. P. Mooers will drive as America's third representative, is propelled by a vertical four-cylinder engine of 80-h.p. Mr. Mooers has always been a firm believer in the vertical type of engine, and his faith in its superiority is shown in the fact that he has built his new racer with this design. Mr. Mooers is also a firm supporter of the bevel gear transmission, with direct drive on high speed; also of the universal shaft, which features he has embodied in the car. Each of the four cylinders are steel, with a cast explosion chamber. Both inlet and exhaust valves are mechanically operated. There are two systems of ignition, one a jump spark placed directly over the inlet valve, the other a contact spark placed alongside the inlet valve. Both can be advanced or retarded by the driver at will from the seat. The car is equipped with sliding gear transmission. The engine, including fly wheel, weighs about 700 lbs., and the car complete about 2,200 lbs., aluminium being used wherever possible to reduce weight. The wheel base is 9 ft. The front wheels are 34 in. in diameter with 4 in. tyres, and the rear wheels 34 in. in diameter with 4½ in. tyres. As will be seen from the illustration we give on another page, the ordinary bonnet is replaced by one of wire netting to allow free access of air to the engine.

the description of these well-known vehicles, but to make our description of the competing cars complete it may be stated briefly that they have four-cylinder engines (140 mm. dia. by 150 mm. stroke), mechanically-operated inlet valves, magneto ignition, combined honeycomb radiator and water tank, and chain transmission.

THE IRISH FORTNIGHT.

ALREADY members of our staff are in Ireland for the Gordon Bennett race, and everything is in hand for full reports of the various proceedings in connection with the official tour of the Club, the programme being as follows:—

- July 1.—Exhibition of competing cars at the Earlsfoot Terrace Rink, Dublin.
- „ 2.—Gordon Bennett Race.
- „ 3.—Gymkhana in Phoenix Park, Dublin.
- „ 4.—Speed Trials in Phoenix Park, Dublin.
- „ 6.—Start for Newcastle and Belfast.
- „ 7.—Speed trials at Castlewellan, co. Down.
- „ 8.—Return to Dublin.

Messrs. Winton and Owen on their Winton Cars, at Timolin Rectory, Ballitore.

[Lawrence Dublin.

Coming now to the French cars, Messrs. Rene de Knyff and Henri Farman will each drive 80-h.p. Panhards, with four-cylinder engines and chain transmission. It is understood that they will be similar to the cars which competed in the Paris-Madrid race, except that the sloping position of the engines, which did not prove satisfactory from the point of view of lubrication, is being altered. The Mors car to be driven by M. Gabriel will be similar to that used by this intrepid chauffeur in Paris-Madrid, the racer he drove to victory as far as Bordeaux having been sold to a wealthy motorist in Holland. The engine has four cylinders, and is said to develop 80-h.p. The transmission is on the well-known Mors lines, with direct drive on top speed.

The disastrous fire at the Cannstatt works the other week has upset the arrangements for Germany's representation in the race, the 90-h.p. cars intended for the event having all been destroyed in the conflagration. It was at first thought that Germany would have to withdraw its challenge, but eventually it has been decided to compete with three of the 1903 type 60-h.p. Mercedes cars, to be driven respectively by Baron de Caters, M. Jenatzy, and Mr. Foxhall Keene, none of whom, curiously enough, are of German nationality. It is hardly necessary for us to repeat

- July 9.—Start for Cork *via* Waterford or Lismore.
- „ 10.—Eliminating Test for motor-boat race.
- „ Motor-car speed trials.
- „ 11.—Motor-boat race for the Harmsworth Cup.
- „ 13.—Start of the tour through the south of Ireland.
- „ 14.—Arrival at Killarney.
- „ 15.—Hill-climbing trial on the Kilorglin-Tralee road for the County of Kerry Cup; and conclusion of official tour.

THE headquarters of the Midland Automobile Club are at the Golfer's Hotel, Sutton, co. Down; of the Scottish Club, the Gresham Hotel, Dublin; and the Yorkshire Club will camp in a field at Ardsclull, right hand side of road. As the bank is about ten feet above the road, a splendid view is obtained of two to three miles of road on which the racers approach the club ground. Camping has been arranged to obviate the difficulty of getting to the position (as the main road is closed at 6 a.m.) and a portion of a field, adjoining the course (and from which also the race can be seen) has been obtained. On this will be

erected two large sleeping tents, with wood floors, and also a dining tent, 30 ft. by 30 ft. The catering has been arranged with Messrs. Powolny, of Leeds, who are sending over complete hampers of provisions, etc., sufficient for seven meals.

ON February 20th, the Bill legislating the Gordon Bennett race was read a first time, the Hon. J. Scott Montagu being sponsor. Only one member stood in the way of its progress, and his objection was on a purely technical point, which was quickly got over by the promoters of the measure. On March 27th the Bill received the Royal Assent—a record in legislative achievement in these latter days.

MEMBERS of the South of Ireland Tourist and Hotel Proprietors' Association will decline to accept any responsibility for damage or injury to motor-cars by fire, storm, flood, or any other cause while on their premises, and will only accept the same into the hotel premises for storage at owners' risk. A charge of 5s. per day is made for storage, and the owner of the car must have removed from the car any loose vessels in which the reserve stock of petrol may be carried, for storage in separate building, to comply with insurance regulations.

THE silent running of the Peerless car when driven over the course by Mr. L. Mooers the other day was a matter of surprise to everyone.

THE Most Rev. Dr. Foley, Bishop of Kildare and Leighlin, has addressed a letter to the Priests of the Diocese, in which he says: "As I took the liberty of expressing an opinion strongly in favour of the motor car race which will take place on July 2nd, I feel that I ought to warn the public against a danger which seems to me a very grave one for some of those who will be spectators of that interesting event. It is hardly to be hoped that the authorities' efforts will be successful unless the multitudes of people who will be massed at certain places along the route, especially in the vicinity of towns, make up their minds to abstain from the use of intoxicating drink. It appears to me that the temptation to excessive drinking will be very great in the case of many who will find themselves restricted to a limited space during the greater part of a July day. Hence I feel called upon to issue a special word of warning to all concerned, and to request the clergy to impress upon their people on next Sunday the necessity of extreme caution in this important matter."

IN the House of Commons Mr. Wyndham, replying to a

The English Team on their Napier Cars.

MR. L. P. MOOERS, the third member of the American team in the Gordon Bennett race, reached Dublin on Thursday last week, having left New York on the 10th inst. Mr. Mooers is accompanied by Messrs. W. H. Starin and W. J. Morgan, the former having been chosen on the day before sailing to attend to details of preparation for the race, and also act as a sort of trainer and manager in helping Mr. Mooers to get into condition for the physical strain. Instead of bringing both the new 80-h.p. Peerless and the 40-h.p. car of last year, as was at first intended, only the new racer was brought by Mr. Mooers. As will be seen from our illustration, the big car has been fitted with a novel hood of wire netting which admits the air to every part of the engine, yet protects it from flying sticks and stones.

Le Mond Sportif publishes an interview with M. Jenatzy, who will form one of the German team in the Cup race. He is reported to have stated that if any of the Mercedes team win it will mean at least from £5,000 to £6,000 for the winner. He also stated that the three Mercedes cars will be shod with Michelin tyres, the Michelin Co., in order to fulfil the regulation that everything on the car shall be manufactured in the challenging country, having established a branch at Frankfort, where the tyres have been made.

question, has stated that the Treasury had not yet arrived at a definite decision as to the question on whom would fall the cost of the extra police necessary for the protection of the public during the race for the Gordon Bennett Cup. A subscription list has in the meantime been opened to defray a portion of the cost entailed in this connection, and the Lord-Lieutenant of Ireland has headed the list with a donation of fifty guineas. Subscriptions may be sent to the offices of the Automobile Club, 110, Piccadilly, W., and addressed to "the Chairman."

MESSRS. BECKETT AND SONS, of Fleet Street, Dublin, have issued a price list of their motor spirit, lubricating oils, etc., and hope to see many British motorists during the present season.

THE accommodation provided by the Irish Motor Company, Limited, of 55, South King Street, Dublin, at their new garage, 17, Golden Lane, Dublin, is very extensive, and many visitors during the Irish fortnight will doubtless be glad to avail themselves of the assistance of this firm.

SOME notable alterations are announced to come into force from the 1st July next, in connection with the London and North-Western Railway Company's Express Boat services from North Wall, Dublin, to Holyhead. The morning boat, which now leaves at 10.15 a.m., will not sail until 11 a.m., and not-

withstanding the later departure, the connecting trains on the English side will reach London at practically the same time as at present. From the interior of Ireland, moreover, passengers may, for the first time, leave at a reasonable hour in the morning from places as far north as Belfast, and as far west as Galway, Sligo, Cavan, Athlone, etc., catch the 11 a.m. steamer, and so reach London and other places in England and Wales during the same day. From the same date the night express steamer now sailing from North Wall at 9.10 p.m. will be made ten minutes later.

The County Surveyor of Armagh in the report to his Council a few days ago set out that during the past twelve months there was a general improvement in the condition of the roads in the county. The prospects of road maintenance in the county were on the whole encouraging, as nearly all the bad contractors had been eliminated. Although but few new contractors had come forward, still he (the surveyor) was every year perfecting the methods which he had adopted for working roads in his own hands; and with a good share of roads in the hands of suitable contractors, he looked forward to a rapid improvement in the condition of the roads. Concluding the report stated that a system of motor-

The secretary of the Automobile Club of Great Britain and Ireland, Mr. J. W. Orde, was present, and explained that the requirements of the Club for the proposed hill-climbing contest at Castlewellan, and of the speed trial from Clough to Castlewellan on July 7th. The council decided to exercise the powers conferred upon them by the recent Act of Parliament to close the roads to ordinary traffic on that day, and to do everything in their power to assist the Club in carrying the race to a successful termination. The Royal Ulster Yacht Club are presenting three cups for the speed trials of touring cars in this contest, and a specially designed cup is being manufactured for the occasion.

RAILWAY SERVICES TO IRELAND.

AMONG English railways, the Great Western have long attempted to woo the Irish traffic, and hence the improvements that have been made in the express service to South Wales. A bold scheme is now in progress in which, in conjunction with the Great Southern and Western Railway of

cars running regularly under proper control over the main roads of the county, and carrying passengers and light goods, would prove of such enormous benefit to the ratepayers that he thought the Council should take into serious consideration the possibility of promoting a complete scheme for the whole county.
